Orkney Islands or Orkneys. — Little is done in these isles during the winter, except fishing on the coast; and in summer, kelp is the staple commodity of the Orkneys. Except juniper, wild myrtles, heath, and a shrub called *cyor-hordon*, there is scarcely a tree or plant to be seen. There are no rivers, but the islands are well supplied with lakes and rivulets, which even turn mills, and produce excellent trout and salmon. The land animals are small horses, sheep, black cattle, swine, rabbits, red deer, and other game; the sheep are so small and meagre, that the common price of one of these animals is 5*s.* their wool is, however, excellent. The heaths abound with partridges, grouse, heath-cocks, plovers, and other game, and there are besides, eagles, ducks, geese, herons, hawks, gulls, soland geese, swans, gannets, &c. The sea swarms with otters and seals, together with plenty of cod, ling, haddock, herrings, and most kind of fish, whales not excepted. Corals, ambergris, sponge, and spermaceti, are sometimes thrown ashore. The chief trade of these islands consists in supplying with provisions the vessels which touch upon the coasts in northern voyages;

and the East India fleet, in time of war, when they pass this way to avoid privateers. They are also visited by the busses in the herring-fishery, which barter tobacco, wine, spirits, and grocery, for provisions. The produce of the kelp made in the islands, has been calculated at about 3000 tons per annum, at the rate of about 6*l.* per ton.

Sardinia. — This island is situated in the Mediterranean, and produces corn, vegetables, cheese, salted tunny, wine, oil, salt, tallow, provisions, ox-hides; sheep, goat and fallow deer-skins, &c. Although corn is the most abundant of Sardinian productions, very little of the article is exported, by reason of the heaviness of the duty laid upon its exportation. The cheese is sent to Naples, Leghorn, Genoa, and Marseilles. The tunny is exported to Spain and Italy. Sardinia imports all sorts of woollen, and linen, drapery, hardware, wrought silks, sugar, iron, cacao, spices, drugs, &c. Formerly the cloths of France alone were in repute here, but several years back they were superseded by those of England; which, in this market, as well as in every other throughout Europe, are esteemed more highly than the woollen drapery of any other part of the world. English serges sell exceedingly well in Sardinia, and about 400 pieces are annually imported from Great Britain. The linens of Germany are readily bought up on account of the lowness of their prices. Silks are brought from Naples and Genoa; sugar and cacao from Marseilles; and the hardware chiefly from England. Iron comes from Leghorn, Genoa, and Marseilles, and hats from England and France.

Scilly Islands. — The inhabitants of these islands employ themselves in fishing, burning kelp, and as pilots. Some of the islands produce excellent corn, and most of them plenty of rabbits, herons, swans, and various species of water fowl.

Shetland Isles. — The coasts of these Scottish islands are well adapted for fishing, but this branch of trade having been much neglected it was taken advantage of by the Dutch; the inhabitants, however, export great quantities of dried fish. Sponge, ambergris, and amber, are found here in abundance. The only tree or shrub of any consequence is the juniper. The black cattle are much larger than those of the Orkneys; their horses are small, but very stout; their sheep are exceedingly delicate, and afford excellent wool. As to manufacture, the inhabitants make a sort of coarse cloth for their own use, and a little linen; but their chief trade is the barter of stockings with the Dutch fishermen, and the sailors of the English Greenland men.

Sicily. — This island is so fertile in grain and fruit, that it was anciently denominated "The Granary of Italy," and "The Nurse of the Roman People." Sicily produces

abundance of oil, sugar, saffron, silk, honey, wax, and various kinds of simples: great quantities of grain are exported to Genoa and Leghorn, and some to Marseilles, Barcelona, Cadiz, and Lisbon; vegetables, such as beans, white kidney-beans, split pease, &c. are sent to Leghorn, Genoa, and Spain; silk, which is the chief source of Sicilian wealth and prosperity, is exported (to the amount of a million ecus annually) to Genoa, Leghorn, Marseilles, Lyons, and to the ports of Great Britain and Ireland: salt is exported chiefly to Venice; pistachio nuts are sent to Leghorn, Marseilles, Venice, Genoa, and Great Britain; sumach to Leghorn, Genoa, Civita-Vecchia, Marseilles, Naples, and Great Britain; about 500lbs. of manna, annually, to Leghorn, Genoa, Marseilles, and Great Britain; 50,000lbs. of hare and rabbit skins to Leghorn, Genoa, Marseilles, Rome, Venice, Trieste, and Naples; 5000 quintals of sweet, and some hundreds of bitter, almonds to Genoa, Leghorn, Venice, Marseilles, and Great Britain; tallow to Leghorn, Genoa, Civita-Vecchia, and Marseilles; liquorice-ball, and refined liquorice, to the amount of 1500 quintals per annum, to Leghorn, Venice, Genoa, Marseilles, Amsterdam, and England; about 50,000 quintals, annually, of olive oil, to Leghorn, Genoa, Marseilles, Trieste, England, and Ireland; linseed oil, in small quantities, to Genoa, Marseilles, Civita-Vecchia, Rome, Venice, and Naples; cream of tartar to Marseilles, Genoa, Leghorn, Venice, and England; cheese to Italy, France, and Great Britain; small quantities of coriander-seeds, pomegranates, and gall-nuts, to Genoa; about 1000 quintals of barilla, annually, to Venice, Marseilles, Leghorn, Genoa, England, and Ireland; citron to Leghorn; preserved oranges to Leghorn, Venice, and Rome; about 78 tons of lemon juice, per annum, to Genoa, Venice, &c.; brimstone to Venice, Leghorn, Marseilles, and Great Britain; fresh tunny to Italy; of salted tunny, about 600 quintals annually, to Italy and France; anchovies and sardines, to the annual amount of 16,000 barrels, to England, Italy, and France; luscious wines to Gibraltar and Genoa; cob-nuts and raisins to England, Holland, France, and Italy; and, finally, kid, lamb, and fox skins, to Italy, France, and Great Britain. The imports of Sicily are as follow: from Leghorn, woollens, caps, stockings, Barbarian and Levantine wools, raw and spun cotton, straw hats, linen, calicoes, iron, pewter, copper, elephants' teeth, gunpowder, lacque, quinquina, cinnamon, pepper, and other kinds of spices, saffron, indigo, cochineal, Brazil-wood, logwood, Turkey-blue, litmus, annatto, verdigris, incense, alum, medicines, sealing-wax, quicksilver, flax, hemp, and hides; from Genoa, velvet, paper, nails, iron, calf-skins, coloured leather, hats, Ger-

man linen, embroidered silks, &c. besides other species of merchandise, similar to those brought from Leghorn; from France, linens, cottons, hats, paper, calf-skins, laces, boxes, embroidered vests, fans, jewellery, camlets, and serges; from Venice, medicinal drugs, quicksilver, sublimate, turpentine, cinnabar, cloths of Padua, scarlet cloths, hats, woollen caps and stockings, deals, nails, wax, copper, mirrors and crystal glass, vitriol, fire-arms, and occasionally maize; from Naples, vast quantities of English and French commodities, besides wood, the growth of Italy, Calabrian pitch, saffron, linen, cloth, earthenware, jewellery, and toys; from Trieste, several kinds of German merchandise, and wood for carpenters' use; from Spain and Portugal, sugar, cacao, quinquina, saffron, vanilla, cochineal, Brazil-wood, tobacco, other species of South American merchandise, and Segovian cloth; from Amsterdam, fine linen, cacao, cinnamon, pepper, cloves, and other Indian spices and drugs; in fine, from England, East and West India goods, watches, hardware, cutlery, jewellery, toys, stationery, hats, hides, copper, pewter, iron, and lead. Messina and Palermo are the chief ports of Sicily.

Wight, Isle of.—The face of this island is beautifully diversified, and the whole extremely fertile. The higher parts of the country produce much chalk, which is used as manure. The chief sorts of grain cultivated here are wheat, barley, and oats; and of pulse, pease and beans. The wheat produced in the southern parts is about 24 bushels per acre, and in the northern about 18; the production of barley, per acre, is averaged at 30 bushels, and oats 35; hence the exports of grain are very considerable. The downs stretching across the island afford pasturage to about 40,000 sheep; and, it is said, that 5000 lambs are annually sent to the London market. The cows are good; the horses are large and generally black, and the hogs are also of a large size, and furnish excellent bacon. Game is plentiful. Among the fossil earth of the district are tobacco-pipe clay, fullers'-earth, yellow and red ochre. The coast yields all the usual species of fish, and the lobsters and crabs are particularly large and excellent. There are very productive salt-marshes in the island. This is also a rallying point of the smuggling traders.

Zante,—an island in the Grecian sea. Zante is extremely fertile in corn, and produces abundance of cherries, from the kernels of which is made a liquor called *marasquin*, and which is highly esteemed in Italy and France. The chief commodity of this island is, however, its currants (*viva Corinthiaca*). There are only two vineyards that produce the grapes, which, when dried, are denominated Zante currants, and are

situated in a delightful plain about the middle of the island ; the grapes are gathered in the month of August, and laid on the ground to dry ; when perfectly dried they are carried to the capital of the island, and lodged in warehouses, called *seraglios*, being poured into them by means of large doors in their roofs, until the warehouses are completely filled ; they adhere so closely when thus lodged, that immediately before their being barrellled, they are obliged to be removed with iron utensils. Opposite to Patros, in the country of the ancient Etolians, there is a village called Anatolio, whose inhabitants cure currants of an extraordinary size, being about twice as large as those of Zante. There are other species of grapes grown in Zante, from which excellent strong wines are made. Oil of good quality is also made here. The Zante melons are equal to the Spanish ; they are of two sorts, white and yellow ; the first, which is of a clear white within, has a greenish rind, and yields a delightful odour, as if it were perfumed with ambergris. The peaches of this island are extremely well flavoured, and so large that each of them weighs from 8 to 10 ounces ; here, likewise, grow in abundance, lemons of an uncommonly large size, oranges, figs, and excellent limes. This island, with those of Corfu and Cephalonia, before mentioned, and the four other small and dependent islands of Maura, Ithaca, Congo, and Paxo, form now altogether an independent state, under what is called "*the protection*" of Great Britain. Of this anomalous government it is not necessary to say any thing. The inhabitants have been rescued from Turkish despotism, and that is a great step gained toward independence, industry, and wealth.

There are other islands in the European seas, in addition to those already enumerated, but they are of such trifling importance, in a commercial point of view, that we do not deem it necessary to notice them particularly.

EXCHANGE, signifies a place in most considerable cities, wherein the merchants, agents, bankers, brokers, interpreters, and other persons concerned in commerce, meet at certain times, to confer and treat together of matters relating to exchanges, remittances, payments, adventures, assurances, freights, and other mercantile negotiations both by sea, and land. The most considerable Exchanges in Europe are those of London, Amsterdam, Dublin, and Bourdeaux.

EXCHANGES are carried on by merchants and bankers all over Europe, and are transacted on their different Exchanges. The mode of exchanging between one kingdom or nation, and another, is, the one gives the certain price, and the other the uncertain price of exchange to each other : *i. e.* Eng-

land gives the price, viz. one pound sterling to France, for an uncertain number of livres and sous, (or francs and cents,) to be paid or received there, and gives the same to Hamburgh, Holland, and the Netherlands, for an uncertain number of schillings and pence Flemish, or of guilders and stivers : and she gives the uncertain price, viz. an uncertain number of pence and parts of pence to other nations ; as for example, she gives from 60*d.* to 70*d.* (more or less) to Lisbon or Oporto for one of their milreis ; from 30*d.* to 40*d.* to Madrid, Cadiz, &c. for their piastre or dollar ; from 35*d.* to 55*d.* to Genoa and Leghorn for a pezzo or dollar, of 5 livres banco at Genoa, and 6 livres at Leghorn ; from 25*d.* to 45*d.* to Naples for a ducat of 10 carlins, or 100 grains ; from 36*d.* to 56*d.* to Venice for a ducato banco of 24 grossi ; from 30*d.* to 40*d.* to Petersburg for a rouble of 100 copecks ; and to Dublin and all parts of Ireland 100*l.* sterling for an uncertain number of pounds, shillings, and pence Irish, to be paid or received there, viz. from 105*l.* up to 115*l.* Irish, as exchange may happen to be.

The par of exchange (or *par pro pari*) is the intrinsic value of the different species of money on the continent, equalised to those of England, and *vice versa* ; as, for instance, the par of exchange between England and Ireland is 8½ per cent. or in other words, 108*l.* 6*s.* 8*d.* Irish, are equal to 100*l.* English ; the English shilling being current in that country for 13*d.* consequently the pound sterling is 1*l.* 1*s.* 8*d.* therefore when the exchange from London on Dublin is 12 per cent. there is a profit or saving of 3*l.* 15*s.* 4*d.* per cent. on every 100*l.* sterling remitted to Ireland.

The course of exchange is always fluctuating, sometimes under, and sometimes over the par of exchange, and is chiefly governed by the balance of trade being for, or against, the negotiating parties ; so that when the exchange is above par, the balance of trade is certainly against them, and when it is under par, it is consequently in their favour. If London ships to Hamburgh merchandise to the amount of 500,000*l.* and at the same time Hamburgh ships to London goods or merchandise to only the amount of 300,000*l.* Hamburgh can only discharge to the amount of 300,000*l.* and for remaining balance of 200,000*l.* she must procure bills of exchange at the lowest possible premium elsewhere, in order to liquidate the debt due to London, as it is not to be supposed that Hamburgh, being indebted to London, can furnish bills on equally good terms with another city not indebted to London. Thus Hamburgh, by paying a premium of 1 per cent. for bills of exchange, would have to pay 202,000*l.* in order to liquidate the aforesaid balance of 200,000*l.* thereby losing 2000*l.* on the transaction.

Thus it is that the balance of trade affects the fluctuation of exchanges.

The certain price always rises in its value as the course is above or below par, and the uncertain price fluctuates in value the con-

trary way. As banco money of Holland is always better than cash or current money, so there is usually a difference of from $1\frac{1}{4}$ to $5\frac{1}{8}$ per cent. which is called the agio, and fluctuates.

The Exchanges on the Continent are negotiated in the following manner, subject to the like fluctuations as before-mentioned, viz.

From Amsterdam to London, from 30 to 40 schillings Flemish, per pound sterling; and, also, from 10 to 12 current florins per pound sterling.

Paris, Bourdeaux, &c. from 50 to 60 groots Flemish, per 3 francs.

Madrid, Cadiz, &c. from 90 to 100 do. per ducat of 375 marvedis plate.

Lisbon, Oporto, &c. from 40 to 50 do. per crusado, or crown of 400 reis.

Genoa and Leghorn, from 80 to 90 do. per pezzo, or dollar of 5 livres banco at Genoa, or 6 livres at Leghorn.

Hamburgh, from 30 to 40 stivers, per exchange ducat of 2 marks.

Petersburgh, from 40 to 50 stivers current per rouble.

From Paris, Bourdeaux, &c. to London, from 22 to 26 francs, per pound sterling.

Amsterdam, from 50 to 60 groots Flemish, per ecu of do.

Madrid, Cadiz, &c. from 15 to 17 francs per doubloon of 32 reals old plate.

Lisbon and Oporto, from 400 to 500 reis per 3 francs.

Genoa and Leghorn, from 90 to 100 sous, per dollar, or pezzì, of livres 5.15 fuer. banco at Genoa, or 6 livres at Leghorn.

Hamburgh, from 25 to 28 schillings banco, per 3 francs.

From Naples to London, from 500 to 600 grains per pound sterling.

From Venice to London, from 24 to 28 Italian livres per pound sterling.

From Madrid, Cadiz, &c. to London, from 30*d.* to 40*d.* per peso, or dollar of 8 reals old plate.

Hamburgh, from 70 to 80 groots per ducat, of 375 marvedis.

Amsterdam, from 90 to 100 groots Flemish, per ditto.

Paris, Bourdeaux, &c. from 13 to 17 francs per doubloon, of 32 reals old plate.

Lisbon and Oporto, from 2000 to 2200 reis per doubloon old plate.

Genoa, from 620 to 660 marvedis plate, per escu d'or marche.

Ditto, from 21 to 25 livres fuero banco, per pistole of 40 reals plate.

Leghorn, from 120 to 130 pesos, or Spanish dollars, for 100 pezzì, or Leghorn dollars, of 6 leras each.

From Lisbon and Oporto to London, from 60*d.* to 75*d.* per milrea.

Amsterdam, from 40 to 50 groots Flemish, per crusado of 400 reis.

Paris, Bourdeaux, &c. from 450 to 500 reis per 3 francs.

Madrid, Cadiz, &c. from 2000 to 2200 reis per doubloon of 32 reals plate.

Genoa and Leghorn from 600 to 800 reis per peso, or dollar of 5.15 livres at Genoa, or 6 livres at Leghorn.

Hamburgh, from 40 to 50 groots Flemish, per crusadon of 400 reis.

From Petersburgh to London, from 9*d.* to 15*d.* sterling per rouble.

Amsterdam, from 40 to 50 stivers per silver rouble.

Hamburgh, from 25 to 35 schillings banco per rouble.

From Genoa and Leghorn to London, from 40*d.* to 50*d.* per dollar of 5 livres banco.

Amsterdam, from 80 to 90 groots Flemish, per ditto.

Paris, Bourdeaux, &c. from 90 to 100 sols in francs, per do.

Madrid, from 620 to 660 marvedis plate, per escude d'or marche (or 22 to 24 livres per pistole of 40 reals plate).

Cadiz, from 120 to 130 pesos per 100 pezzì.

Lisbon, Oporto, &c. from 600 to 800 reis per dollar of 5.15 livres fuero banco.

From Hamburg to London, 30 to 40 schillings Flemish, per pound sterling.
 Paris, Bourdeaux, &c. from 25 to 28 schillings banco per 3 francs.
 Madrid, Cadiz, &c. from 60 to 80 groots per ducat of 375 marvedis.
 Amsterdam, from 30 to 40 stivers per 2 banco marks.
 Ditto (in current money at 120 marks, from 105 to 110 guilders).
 Lisbon and Oporto, from 40 to 50 groots Flemish, per crusado of 400 reis.

We shall now give some examples of the operations of exchange between London and those places with which she has a direct exchange, subject to fluctuations as before-mentioned, viz.

London. — *Course of Exchange.*

	Time.		Uncertain Prices.	Certain Prices.
Amsterdam	- 3 Ms.	gives	37 schillings Flemish	for 1 pound sterling.
Dublin	- 21 days' sight.	gives	110½ pounds Irish	for 100 pounds British.
Paris, Bourdeaux, &c.	3 Ms.	give	25 livres Tournois	for 1 pound sterling.
Idem	- - -	gives	25 francs	for 1 pound sterling.
Genoa	- 3 Ms.	receives	46d. sterling	for 1 pezza fuori di banco.
Hamburg	- 3 Ms.	gives	35 schillings Flemish	for 1 pound sterling.
Leghorn	- 3 Ms.	receives	50d. sterling	for 1 pezza of 8 reals.
Naples	- 3 Ms.	receives	39d. sterling	for 1 ducat di regno.
Lisbon, Oporto, &c.	60 days	receive	63½d. sterling	for a milreis (or 1000 reis).
Rotterdam	- 3 Ms.	gives	12 florins current	for 1 pound sterling.
Madrid, Cadiz, &c.	- 3 Ms.	receive	36d. sterling	for 1 dollar of exchange.
Venice	- 3 Ms.	gives	26 Italian livres	for 1 pound sterling.

Monies of Exchange and Regulations with regard to London.

A pound = 20 shillings, or 240 pence.

A shilling = 12 pence, or 48 farthings.

Accounts are kept in pounds, shillings, and pence: some reckon farthings.

Value of usances for bills drawn from

Holland	- 1 month after date.
Spain and Portugal	2 ditto.
Italy	- 3 ditto.

There are three days of grace, which begin the day after the bills are due, and on the third day they must be paid or protested. Bills due on Sunday must be paid or protested on Saturday: for these at sight, no days of grace are allowed.

London on Amsterdam.

Reduce 4086 florins, 4 stivers, 6 penings banco, into pounds, shillings, and pence sterling, at the exchange of 38 schillings, 2 groots Flemish banco, per pound sterling.

Here 1 florin = 40 groots.
 12 groots = 1 schilling.
 32 schil. 2 groots = 1 pound.

RULE.—Multiply 4086 4 6 by 40 groots; divide the product by 38 2 price of exchange and by 12 groots.

38.2 4086 4 6
 12 40

458 div. 163440
 for 4 stivers 8
 for 6 penings ¾

458)163448¾ (356l. 17s. 6d. result
 by common division.

N. B. When the price of exchange consists of schillings Flemish only, multiply the sum by 10 instead of 40, and multiply the price of exchange by 3 instead of 12.

London on Dublin, Cork, &c.

Reduce 293 pounds, 10 shillings, and 6 pence Irish, into pounds, shillings, and pence British, at the exchange of 14 per cent.

£114 Irish = £100 British.

RULE.—Multiply 293 10 6 by 100, and divide the product by 114, price of exchange.

293 10 6
 100

29300 ÷
 for 10 shill. 50
 for 6 pence 2 10

114)29352 10 (257l. 9s. 6d. result
 by common division.

To prove this operation, that is to calculate the exchange of Dublin on London, multiply 257l. 9s. 6d. by 114, price of exchange, and divide the product by 100.

N. B. British money is 8½ per cent. better than Irish; therefore,

12 pounds British = 13 pounds Irish.

London on Paris, Bourdeaux, &c.

Reduce 3222 livres, 2 sols, 9 deniers Tournois, into pounds, shillings, and pence sterling, at the exchange of 25 livres, 14 sols Tournois per pound sterling. Here 25 livres, 14 sols = 1 pound.

RULE.— Divide 5222 2 9 by 25 14, price of exchange.

25 14 5222 2 9
20 fraction. 20 fraction.

514 div. 514|64142 15(125l. 7s. 6d. result.

Reduce 2545 francs, 41 cents, into pounds, shillings, and pence sterling, at the exchange of 24 francs, 80 cents, per pound sterling. Here 24 francs, 80 cents = 1 pound.

RULE.— Divide 2545 41 by 24 80, price of exchange.

2480|2545 41(102l. 12s. 9d. result.

Reduce 5925 francs 75 cents, into livres, sous, and deniers.

RULE.— Multiply by 81, and divide by 80. Result, livres 6000.

Reduce 6000 livres into francs and cents.

RULE.— Multiply by 80, and divide by 81.

Result 5925 francs, 75 cents. The exchange between London and Paris is now done in francs and cents; livres, sous, and deniers being abolished.

London on Genoa.

Reduce 1277 pezze 13 soldi, 4 denari fuori di banco, into pounds, shillings, and pence sterling, at the exchange of 45 pence sterling per pezza, of 115 soldi fuori di banco.

Here 1 pezza = 45 pence.

240 pence = 1 pound.

RULE.— Multiply 1277 13 4 by 45, price of exchange, and divide the product by 240 pence.

London on Venice.

Reduce 14783 lire, 3 soldi, 9 denari piccole, into pounds, shillings, and pence sterling, at the exchange of 59 lire piccole effective per pound sterling.

59 lire = 1 pound.

RULE.—Divide 14783 3 9 by 59, price of exchange.

59)14783 3 9(250l. 11s. 3d. result.

We shall now give the exchanges from Holland, as also some examples of the operations with some places with which she has a direct exchange.

Amsterdam, &c. — Course of Exchange.

Uncertain Prices.

Certain Prices.

London - - -	receives	37	schillings Flemish	for	1	pound sterling.
Idem - - -	receives	12	florins current	-	1	pound sterling.
Breslaw - - -	receives	44	stivers banco	-	1	libia banco.
Dantzic - - -	receives	1	pound Flemish	-	372	groshen current.
Paris, &c. - - -	receives	54	groots Flemish	-	3	francs.
Frankfort - - -	gives	139	rixdollars	-	100	rixdollars current.
Geneva - - -	receives	90	groots Flemish	-	1	crown current.
Genoa - - -	receives	83	groots Flemish	-	1	pezza fuori di banco.
Hamburgh - - -	receives	33	stivers banco	-	1	marc lubs banco.
Idem - - -	receives	106	florins current	-	120	marcs lubs banco.
Leghorn - - -	receives	88	groots Flemish	-	1	pezza of 8 reals.
Lisbon and Oporto - - -	receive	44	groots Flemish	-	1	crusade of 400 reis.
Madrid, Cadiz, &c. - - -	receive	89	groots Flemish	-	1	ducat of exchange.
Venice - - -	gives	4	lire 18 soldi	-	1	florin banco.
Vienna - - -	receives	25	stivers banco.	-	1	rixdollar current.

Moneys of Exchange and Regulations at Amsterdam, &c.

A rixdollar (rix dalder) = 2½ florins = 50 stivers = 8½ sch. Flemish, or 100 groots Flemish

A florin or guilder (gulden) = 20 stivers = 3½ schillings Flemish, or 40 groots Flemish.

A stiver (stuyver) = 16 penings, or 2 groots Flemish.

A pound Flemish (pond Flaams) = 20 schillings Flemish = 240 grotes Flemish, or 6 florins.

A schilling Flemish (schilling Flaams) = 12 groots Flemish, or 6 stivers.

A groot Flemish (groot Flaams) = ½ stiver, or 8 penings.

2 rixdollars = 5 florins.

3 rixdollars = 25 schillings Flemish.

3 florins = 10 schillings Flemish.

Accounts are kept here in florins, stivers, and penings.

Value of Usances for bills drawn from

England and France	- - - - -	1 month after date.
Spain, Portugal, and Italy	- - - - -	2 months after date.
Dantzic and Konigsberg	- - - - -	40 to 70 days after date.
Germany and Switzerland	- - - - -	14 days after sight.

There are 6 days of grace, Sundays and holidays included, for bills of exchange drawn in current money, but for those drawn in bank money, no days of grace are generally allowed, and bills are protested on the second or third day after they become due.

Amsterdam on London.

Reduce 356 pounds, 17 shillings, and 6 pence sterling, into florins, stivers, and penings banco, at the exchange of 38 schillings, 2 groots Flemish banco per pound sterling.

1 pound = 38 schillings, 2 groots.

1 schilling = 12 groots.

40 groots = 1 florin.

RULE.—Multiply 356 17 6 by 38.2, price of exchange, and by 12 groots; divide the product by 40 groots.

$$\begin{array}{r} 356 \ 17 \ 6 \\ 38.2 \times 12 = 458 \end{array}$$

Exchange with the United States of America.

Monies of Exchange and Regulations.

A dollar = 100 cents.

Accounts are kept in dollars and cents, each dollar is rated at 4s. 6d. sterling at par: therefore, 40 dollars = 9 pounds sterling.

Course of Exchange.

Uncertain prices.

Certain prices.

Amsterdam receives } for 1 florin current.
37 cents -

Hamburg receives } for 1 marc lubs banco.
33½ cents -

N. B. America exchanges with London at par, or at so much per cent. either above or under par. When the exchange is not at par, they reduce the sterling into dollars, and add or deduct, according to the circumstance, the agio, which is the difference between the par of exchange and the actual course.

Currencies and their Par in Sterling.

A pound currency = 20 shillings, or 240 pence.

In Georgia and South Carolina, a dollar is worth 4s. 6d. currency; therefore 100 pounds currency = 100 pounds sterling.

In New England and Virginia, a dollar is worth 6s. currency; therefore 133½ pounds currency = 100 pounds sterling.

To reduce this currency into sterling, multiply by 5 and divide by 4.

In Delaware, Maryland, New Jersey, and Pennsylvania, a dollar is worth 7s. 6d. currency; therefore 166⅔ pounds currency = 100 pounds sterling.

To reduce this currency into sterling, multiply by 5 and divide by 5.

In New York and North Carolina, a dollar is worth 8s. currency; therefore 177⅔ pounds currency = 100 pounds sterling.

To reduce this currency into sterling, multiply by 9 and divide by 16.

N. B. The several provincial currencies above mentioned are abolished in the United States of America, and the accounts kept in those monies are not admitted in the courts of justice: they are still used, however, by the force of habit, in certain commercial transactions.

America on London.

Reduce 173l. 17s. 6d. sterling, into dollars and cents, at par.

9 pounds = 40 dollars.

6,00

To prove this operation, multiply 803l. 1s. 6d. by 100 pounds, and divide the product by 140, price of exchange.

N. B. The exchange between Jamaica and Great Britain is 140 per cent. as above stated; but the other islands are different, the exchange being variable, from 150 to 175 per cent. all of which may be calculated according to the above rule.

Arbitration of exchanges is a calculation, by combining the dates of exchange of two or more places, to draw therefrom that which shall be most advantageous to remit or draw on. If bills remained always at par, or if the course of exchange was susceptible of being regulated with accuracy, there would be no such thing as an advantage to be obtained in one more than the other. The data to go upon are easily to be obtained, as the current prices are always published at short intervals.

The following examples will illustrate the nature of this subject.

London and Amsterdam.

Proportional exchange.

	Quotation at London.	Quotation from Amsterdam.
On Amsterdam	37 3	36
Genoa	45	83½
Hamburg	35	34
Leghorn	48½	90
Lisbon	62	44½
Madrid	34½	88½
Paris	25 15	53½

Observation. — London gives the certain price to Amsterdam; that is, 1l. sterling for so many shillings banco, more or less; therefore, when London remits to Amsterdam, that place through which the highest course of exchange can be obtained is to be preferred, because more schillings Flemish will be received in exchange for one pound sterling. On the contrary, when London has to draw upon Amsterdam, that place should be chosen which furnishes the lowest course, because less schillings Flemish will be given in exchange for a pound sterling. If you include the charges in the calculation, insert, for an indirect remittance, 100 in the divisor, and 100 less the charges in the dividend; and for an indirect draft, place 100 in the divisor, and 100 more the charges in the dividend.

N. B. The above quotations are successively combined in the following arbitrations, to ascertain the advantage which may be derived from the comparison of the different proportional exchanges.

London and Amsterdam through Genoa.

A bill on Genoa, taken at London at 45 pence sterling, per pezza of 5¼ lire fuori di banco, is remitted to Amsterdam, and negotiated at 83½ groots Flemish banco per pezza fuori di banco, what is the proportional exchange between London and Amsterdam?

1 pound sterling = 240 pence.

45 pence = 1 pezza.

1 pezza = 83½ groots.

12 groots = 1 schil. Flemish.

RULE. — Multiply 20, fixed number, by the course of exchange between Amsterdam and

Genoa; and divide the product by the course of London on Genoa, that is, $\frac{20 \times 83\frac{1}{2}}{45} = 37.1\frac{1}{2}$

London on Amsterdam through Hamburg.

A bill on Hamburg, taken at London at 35 schillings Flemish banco per pound sterling, is remitted to Amsterdam, and negotiated at 34 stivers banco for 2 marcs lubs banco, what is the proportional exchange between London and Amsterdam?

- 1 pound sterling = 35 schillings Flemish.
- 8 schil. Flemish = 3 marcs.
- 2 marcs banco = 34 stivers banco.
- 6 stivers - = 1 schilling Flemish.

RULE.—Multiply the course of exchange between London and Hamburg, by the course of Amsterdam on Hamburg, and divide the product by 32, fixed number, that is, $\frac{35 \times 34}{32} = 37.2\frac{1}{2}$

London on Amsterdam through Leghorn.

A bill at Leghorn, taken at London at 48½ pence sterling per pezza of 8 reals, is remitted to Amsterdam, and negotiated at 90 groots Flemish banco per pezza of 8 reals, what is the proportional exchange between London and Amsterdam?

- 1 pound = 240 pence.
- 48½ pence = 1 pezza.
- 1 pezza = 90 groots.
- 12 groots = 1 schilling Flemish.

RULE.—Multiply 20, fixed number, by the course of exchange between Amsterdam and Leghorn, and divide the product by the course of London on Leghorn.

$$\begin{array}{r} 48\frac{1}{2} \text{ } 20 \\ 2 \text{ fraction } \text{ } 90 \\ \hline 97 \text{ div. } \text{ } 1800 \\ \hline \text{ } 2 \text{ fraction.} \\ \hline 97)5600(37.1\frac{1}{2} \end{array}$$

London and Amsterdam through Lisbon.

A bill on Lisbon, taken at London at 62 pence sterling, per mil reis, is remitted to Amsterdam, and negotiated at 44½ groots Flemish banco per crusade of 400 reis: what is the proportional exchange between London and Amsterdam?

- 1 pound = 240 pence.
- 62 pence = 1000 reis.
- 400 reis = 44½ groots.
- 12 groots = 1 schil. Flemish.

RULE.—Multiply 50, fixed number, by the course of exchange between Amsterdam and Lisbon; and divide the product by the course of London on Lisbon, that is, $\frac{50 \times 44\frac{1}{2}}{62} = 35.10\frac{1}{2}$.

London on Amsterdam through Madrid.

A bill on Madrid, taken at London at 34½

pence sterling, per dollar of exchange, is remitted to Amsterdam, and negotiated at 88½ groots Flemish banco per ducat of exchange: what is the proportional exchange between London and Amsterdam?

- 1 pound sterling = 240 pence.
- 54½ pence = 1 dollar.
- 375 dollars = 272 ducats.
- 1 ducat = 88½ groots.
- 12 groots = 1 sch. Flemish.

RULE.—Multiply 1088, fixed number, by the course of exchange between Amsterdam and Madrid; and divide the product by 75, fixed number, multiplied by the course of London on Madrid.

$$\begin{array}{r} 75 \text{ } 1088 \\ 34\frac{1}{2} \text{ } 88\frac{1}{2} \\ \hline 500 \text{ } 8704 \\ 225 \text{ } 8704 \\ 37\frac{1}{2} \text{ } 272 \\ \hline 2587\frac{1}{2} \text{ } 96016 \\ 2 \text{ fraction } \text{ } 2 \text{ fraction} \end{array}$$

$$5175 \text{ div. } 5175)192032(37.1\frac{1}{2} \text{ result.}$$

London and Amsterdam through Paris.

A bill on Paris, taken at London at 25 livres, 15 sols Tournois per pound sterling, is remitted to Amsterdam, and negotiated at 55½ groots Flemish banco for 3 francs, what is the proportional exchange between London and Amsterdam?

- 1 pound sterling = 25¼ livres Tournois.
- 81 livres Tournois = 80 francs.
- 3 francs = 55½ groots.
- 12 groots = 1 schil. Flemish.

RULE.—Multiply 20, fixed number, by the course of exchange between London and Paris, and by the course of Amsterdam on Paris; divide the product by 729, fixed number: that is, $\frac{20 \times 25\frac{1}{4}}{729} = 37.9\frac{1}{2}$ result.

Recapitulation of the proportional exchange between London and Amsterdam.

Through Genoa it comes out at	37	11
Hamburg	37	2½
Leghorn	37	1½
Lisbon will answer to draw	35	10½
Madrid	37	1½
Paris will answer to remit	37	9½
Direct course between London and Amsterdam	37	3

Application to remit.—It appears by the comparison of the above-mentioned exchanges, that the proportionable exchange on Paris is the highest, and consequently, that it would be more advantageous to remit to Amsterdam by that place than by either of the others, or by a direct bill: such remittance would establish an indirect course of 37.9½, instead of the direct, 37.3; so that a mer-

chant would receive 37 schillings, $9\frac{1}{2}$ groots Flemish, in exchange for 1 pound sterling.
37.3 direct course : 37.9 $\frac{1}{2}$ indirect

course :: 100 :	-	-	101	9	1
Less charges at $\frac{3}{4}$ per cent.	15	0	}	1	9
Advantage resulting from the arbitration	-	14			
			100	0	0

Application to draw.—If a merchant at London have to value on Amsterdam, instead of drawing directly, he would order his correspondent at Amsterdam to take a bill on Lisbon at $44\frac{1}{2}$, and either to remit it thither to provide for drafts from London on Lisbon at 62, or to remit it to London to be negotiated at the same price. Such operation would establish an indirect course of $35.10\frac{3}{5}$, instead of the direct, 37.3; so that a merchant would give only 35 schillings, $10\frac{3}{5}$ groots Flemish, for 1 pound sterling.

37.3 direct course : 35 $10\frac{3}{5}$ direct course :: 100 :	-	-	96	6	10
Add for charges, at $\frac{3}{4}$ per cent.	-	0	15	0	}
Advantage resulting from the arbitration	-	2	18	2	
			100	0	0

London and Genoa
Proportional exchange.

Quotation. At London.	Quotation. from Genoa.
On Genoa - 46	
Amsterdam 37.4	- 84 $\frac{7}{8}$
Hamburg 35.4	- 46 $\frac{1}{4}$
Leghorn 50	- 124 $\frac{1}{2}$
Lisbon - 61 $\frac{1}{2}$	- 765
Madrid 34 $\frac{3}{4}$	- 660
Paris - 25.2	- 94 $\frac{7}{8}$

Observation.—London gives the uncertain price to Genoa; that is, 46 pence sterling, more or less, for 1 pezza fuori di banco; therefore, when London remits to Genoa, that place through which the lowest course of exchange can be obtained is to be preferred, because less pence will be given in exchange for a pezza.

If you include the charges in the operation, insert, for an indirect remittance, 100 less the charges in the divisor, and 100 in the dividend; and for an indirect draft, place 100 more the charges in the divisor, and 100 in the dividend.

N. B. The above quotations are successively combined in the following arbitrations, to ascertain the advantage which may be derived from the comparison of the different proportional exchanges.

London on Genoa through Amsterdam.

A bill on Amsterdam, taken at London at 37 schillings, 4 groots Flemish banco per pound sterling, is remitted to Genoa, and negotiated at $84\frac{7}{8}$ groots Flemish banco per

pezza of $5\frac{1}{4}$ lire fuori di banco: what is the proportional exchange between London and Genoa?

1 pezza = 84 $\frac{7}{8}$ groots.
12 groots = 1 schilling Flemish.
37 $\frac{1}{2}$ schil. Flemish = 1 pound sterling.
1 pound = 240 pence.

London and Genoa through Paris.

A bill on Paris, taken at London at 25 livres 2 sols Tournois per pound sterling, is remitted to Genoa, and negotiated at 94 $\frac{7}{8}$ sols in francs per pezza of 115 soldi fuori di banco: what is the proportional exchange between London and Genoa?

1 pezza = 94 $\frac{7}{8}$ sols.
20 sols = 1 franc.
80 francs = 81 livres Tournois.
25 $\frac{1}{10}$ livres Tournois = 1 pound sterling.
1 pound sterling = 240 pence.

RULE.—Multiply 245, fixed number, by the course of exchange between Genoa and Paris, and divide the product by 20, fixed number, multiplied by the course of London on Paris.

20	243
25 $\frac{1}{10}$	94 $\frac{7}{8}$

Recapitulation of the proportional exchange between London and Genoa.

Thro' Amsterdam it comes out at - 45 $\frac{1}{2}$
Hamburg will answer to remit 45
Leghorn - - - - - 46 $\frac{3}{10}$
Lisbon will answer to draw 47 $\frac{1}{10}$
Madrid - - - - - 45 $\frac{5}{10}$
Paris - - - - - 45 $\frac{1}{10}$

Direct course between London and Genoa - - - - - 46

Application to remit.—It appears by the comparison of the above-mentioned exchanges, that the proportional exchange upon Hamburg is the lowest, and consequently, that it would be more advantageous to remit to Genoa by that place, than by either of the others, or by a direct bill; such remittance would establish an indirect course of 45, instead of the direct 46, so that a merchant would give only 45 pence in exchange for one pezza fuori di banco.

46 direct course : 45 indirect course :: 100%. 97 16 6

Application to draw.—If a merchant at London had to value on Genoa, instead of drawing directly, he would order his correspondent at Genoa to take a bill on Lisbon at 765, and either to remit it thither to provide for drafts from London upon Lisbon, at 61 $\frac{1}{2}$, or to remit it to London to be negotiated at the same price; such oper-

ation would establish an indirect course of 47½, instead of the direct 46, so that a merchant would receive 47½ pence in exchange for a pezza.

EXCHANGE-BROKER, is a person so called, who regularly attends on 'Change, for the purpose of negotiating foreign bills for the merchants, and for which he is usually paid a brokerage of ¼th per cent. upon the amount.

EXCHEQUER.—This, which is a court of law and equity, is a very ancient court of record, established by William the Conqueror, as a part of the *aula regis*, though regulated and reduced to its present state by Edward I., intended chiefly to order the revenues of the crown, and to recover the king's debts and duties. An appeal from the equity side of this court lies immediately to the house of peers; but from the common law side, pursuant to 31 Ed. III. c. 12. a writ of error must first be brought into the court of exchequer chamber, whence, in the *dernier resort*, there lies an appeal to the house of lords.

EXCHEQUER-BILLS, bills of credit issued by the authority of parliament, payable with interest out of the produce of a particular tax, or more frequently out of the supplies to be granted in a future session. The sum of 2,750,000*l.* is usually raised in this manner on credit of the malt tax, and tax on personal estates, although it is well known that these taxes never produce so much, the deficiency being always made good out of the next supplies. The sum to be issued out of the consolidated fund is likewise usually raised by these bills, charged upon the growing produce of the surplus of the said fund; also other sums for ordinary and extraordinary expenses, by bills charged upon the first supplies of the next session. The Bank contract with government for the circulation of these bills, at a certain premium. The interest they carry has been at various rates; those at present in circulation, bear interest at the rate of two-pence half-penny a day *per cent.* which is computed up to the day of sale, from the respective dates of the bills. They are from 100*l.* each, to 1000*l.*, and some for much larger sums: they are numbered arithmetically, and registered accordingly. When they are to be paid off, or interest at least upon them, to cease, such payment is notified by advertisement. The daily transactions between the bank and the exchequer are chiefly carried on by bills of 1000*l.* each, which are deposited by the bank in the exchequer, to the amount of the sums received by them on

government's account; the bank notes and cash thus received by the bank being retained by them, as the detail part of the money concerns of government is all transacted at the bank. The instalments on loans are paid into the receipt of the exchequer by these exchequer-bills of 1000*l.* each, which are received again by the bank as cash, either for the amount of dividends due, or in repayment of advances; and as, while deposited in the exchequer, they are considered merely as a pledge or security, they of course continue to bear interest, till the advance, on which the bank first received them, is paid off.

The premium or discount at which exchequer-bills sell, depends on the proportion which the interest payable on them bears to the interest produced by the public funds, according to their current prices.

Exchequer-bills, though the same in their nature and solidity, differ in their origin from navy-bills in this, that they are issued in anticipation of revenue, and circulated by the Bank of England to raise money. During the recess of parliament, there is a sum left to the credit of the chancellor of the exchequer, to serve in cases of exigency. The bank makes advances to the amount voted, for which the exchequer issues bills.

There is a standing contract between government and the bank, for the trouble and expense attending the issue and circulation of these bills. The payment is made at the exchequer-bill office, Westminster. See **BANK**.

EXCISE, one of the principal branches of the public revenue, consists of inland duties, or taxes on articles manufactured or consumed; whereas the duties of customs are paid on goods brought into, or carried out of, the country. It originated in the year 1626, but was not actually established till 1643, when the long parliament laid an excise duty on beer, ale, and other liquors, with a solemn declaration that at the end of the war all excises should be abolished!! The example was immediately followed by the king and parliament of Oxford, who established similar excise duties, and the war continuing longer than was expected, this mode of levying money was extended to bread, meat, salt, and many other necessary articles. The excise on bread and meat was afterwards repealed, but the duties on beer and ale were continued, and after the restoration, were granted to Charles II. during his life; from whose death they were continued, under the title of the *temporary excise*, to the different sovereigns, during their respective lives, a part of the civil-list revenue: but they are now placed on the same footing as all the other permanent taxes, being made perpetual, and the produce carried to the consolidated fund. The *hereditary excise* was a duty of 15*l.* per barrel upon beer and ale, and a proportionate sum upon other liquors sold

in the kingdom, and was granted to Charles II., his heirs and successors for ever, as a compensation for the profits of the feudal privileges of wardship and purveyance, then abolished by act of parliament. These two branches, which comprehend all the excise duties existing at the revolution, produced on an average 610,486*l.* yearly. During the reign of William III. the excise was extended to salt; additional duties were laid on beer and ale, and an excise duty on malt, (which has since been granted annually,) was established.

In the reign of Queen Anne, candles, hides, and skins, vellum and parchment, paper and pasteboard, soap, starch, hops, and some other articles, were subjected to excise duties. In the reign of George I. the excise duties, with all other taxes which had been granted for terms of years, were made perpetual; a duty was laid on wrought plate, and the principal part of the duties on tea, coffee, and chocolate, was transferred from the customs to the excise. During the reign of George II. considerable additions were made to excise duties, by licences; a duty on glass, and new duties on spirituous liquors, coffee, chocolate, and malt; since that period numerous additional duties have been imposed on all the articles subject to the excise, which, with the increased consumption, caused by the progress of population and luxury, has rendered this source of the revenue so productive, that it is not surprising those who have had the management of the public finances should have become partial to it, though it has always been an obnoxious mode of taxation.

The whole produce of this tax during the 12 years of the reign of King George I. was 30 421,454*l.*

The produce of one year ending 5th Jan. 1822, was 29,815,553*l.* including the annual duties. See further, title REVENUE.

In England the excise duties are collected at an expense of 2*l.* 16*s.* 1*d.* per cent. on the gross revenue, or 3*l.* 0*s.* 4*d.* per cent. on the net produce; but the expense of collecting in Scotland amounts to 7*l.* 8*s.* 6*d.* per cent. on the gross of the revenue, or 8*l.* 10*s.* 6*d.* per cent. on the net produce. In Ireland the management of the excise-duties is united with the customs, and the expense of the whole amounts to 11*l.* 3*s.* 3*d.* per cent., on the net revenue. See CUSTOMS, REVENUE, &c.

EXCISE LAWS.—For the more easily levying the revenue of excise, the kingdom of England and Wales is divided into about fifty collections, some of which are called by the names of particular counties, others by the names of great towns; where one county is divided into several collections, or where a collection comprehends the contiguous parts of several counties. Every such collection is subdivided into several districts, within which there is a

supervisor; and each district is again subdivided into out-rides and foot-walks, within each of which there is a gauger or surveying officer.

The commissioners or sub-commissioners, in their respective circuits and divisions, shall constitute, under their hands and seals, so many gaugers as they shall find needful.

Arrears of duties.—By several acts of parliament, all articles in the possession of persons subject to the excise-laws, together with all the materials and utensils of whatever description, are made liable for the arrear of duties, whether these be single or double duties; and if a trader, being in arrears for the single duties, become a bankrupt, and be convicted after the assignment of his effects, the double duties are a lien upon the excisable commodities, utensils, and materials in the hands of his assignees, and the commissioners, or magistrates, may authorize the penalty to be levied upon all such commodities, and all the materials, preparations, utensils, and vessels for making thereof, in the custody of the bankrupt, or any person or persons in trust for him.—2 Doug. 411.

Bonds,—for the exportation of excisable commodities, are to be taken by officers of excise, and they are to be given generally upon all excisable articles, at the place where exported.

Forgery—of any stamps, licences, certificates, permits, or any other excise documents, is by various statutes made a capital felony.

Licences.—In all cases where licences are required, the licence will only sanction the business carried on in that particular place for which such licence was granted; but when the business is carried on by partners, one licence will be sufficient to cover the firm.

Officers of Excise.—The officers of excise are to be appointed, and may be dismissed, replaced, or altered by the commissioners, under their hands and seals: their salaries are allowed and established by the treasury; and by 1 W. and M. c. 24. s. 15. if it be proved by two witnesses, that any officer has demanded or taken any money, or other reward whatever, except of the king, such offender shall forfeit his office. Also by 24 Geo. 3. c. 47. any person bribing, or offering to bribe, an officer of excise is liable to a penalty of 500*l.* And by 38 Geo. 3. c. 54. the excise officer to be transported.

By several statutes no process can be sued out against any officer of excise, for any act done in the execution of his office, until one month after notice given specifying the cause of action, and the name and abode of the person who is to begin, and the attorney who is to conduct the action; and within one month after such notice, the officer may tender amends, and plead

such tender in bar; and having tendered insufficient, or no amends, he may, with leave of the court, before issue joined, pay the money into court. *See* 25 Geo. 3. c. 70. and *Daniel v. Wilson*, 5 Term R. 1.

Officers of excise are empowered to search, at all times of the day, entered warehouses, or places for tea, coffee, &c. But private houses can only be searched upon oath of the suspicion, before a commissioner or justice of peace, who can, by his warrant, authorize a search; if upon the examination of the informant such commissioner or justice shall think there is sufficient ground of suspicion. *Cooper and Cameron v. Boot*, in error. 25 Geo. 3. B. R.

Permits.—Persons dealing in exciseable commodities are entitled to permits for removing the same to different places in certain quantities, and under certain regulations. These permits are written upon a peculiar species of paper, manufactured expressly for the purpose; and by 25 Geo. III. c. 70. s. 11. no permit paper is to be delivered out before it shall be filled up agreeably to the request-note of a trader; and officers knowingly granting any false permit, making false entries in the counterpart thereof, or receiving any commodities into stock with a false or forged permit, are to be transported for seven years.

Samples.—Officers of excise are by various acts, empowered to take samples of exciseable commodities, paying the prices therein regulated for the same.

Seizures.—When an officer makes a seizure of any spirits, or other articles, he must lay his hand on the casks, vessels, &c. so seized, and declare that he seizes such spirits, &c. and the casks or vessels containing the same, for the use of his majesty and of himself; but if the officer happen to be alone when he makes such seizure, he must afterwards, in the presence of witnesses, again lay his hand on such cask or vessel, &c. and repeat the former declaration of seizure.

All information on seizures must be laid in the names of the officers making the same.

Scales and Weights.—By various acts of parliament, traders subject to the excise-laws, are to keep just and sufficient scales and weights, under penalty of 100*l.* for every such offence, and the scales and weights may be seized by the officer.

Traders, manufacturers, and dealers liable to the excise-duties, are to assist the officers in weighing stock; and forcibly obstructing, or using any art or contrivance to prevent or impede the officers from taking a true account, incurs a penalty of 100*l.*

By 46 Geo. 3. c. 112. or stat. 26 Geo. 3. c. 77. s. 13. directing that prosecutions in courts of record for penalties relating to the customs or excise shall be prosecuted in the name of the attorney-general, or some officer

of such revenues, shall extend to all proceedings for excise penalties before commissioners of excise, or justices of peace. s. 1.

Persons taking false oaths in any case where an oath is required by the excise laws, shall be liable to the pains of perjury. s. 3.

By 47 Geo. 3. sess. 2. c. 30. the commissioners, on evidence that the forfeiture arose without any design of fraud, may restore any seizures upon such terms and conditions as they may deem proper.

By 49 Geo. 3. c. 81. where any vessels would, if found, be liable to forfeiture for want of entry, or notice, or for being private or concealed, all the utensils used in any private or unentered place where any such vessel shall be found, shall be forfeited. s. 8.

By 53 Geo. 3. c. 21. persons committed to prison for offences against the customs and excise laws, if poor, are entitled to a daily allowance for sustenance from the commissioners of those boards respectively.

By 53 Geo. 3. c. 103. the executors of persons having taken out licences from commissioners of excise for carrying on certain trades, are empowered to continue the exercise of those trades till the expiration of the terms mentioned in such licences respectively.

By 54 Geo. 3. c. 171. commissioners of the treasury are empowered to restore seizures, and to remit penalties, incurred under laws of customs and excise, on conditions.

The 56 Geo. 3. c. 104. for the prevention of smuggling, and for rewarding persons making seizures, is too comprehensive in its provisions even to be epitomized to any considerable extent here, but the most commonly useful of its provisions are the following:

By sect. 2. officers of the army and navy on half-pay may be authorized by the lords of the treasury to make seizures.

Sect. 6. authorises such officers to carry offenders before justices of the peace, who may convict, and such officers shall on such conviction receive rewards in proportion to the value of the articles produced before such justices. Also provides that in certain cases of failure in securing offenders or seizing goods, lords of the treasury may nevertheless grant rewards to such officers for diligence.

Sect. 14. gives to two justices like powers of adjudication, in cases of seizure under laws of customs, as they previously had under those of excise.

Sect. 15. prohibits actions being brought, or informations taken, for penalties imposed by this act, except by order of the commissioners of excise, or in the name of the attorney-general.

The 57 Geo. 3. c. 87. explains and amends the provisions of the immediately preceding statute relative to the persons entitled to

rewards, and directs that such rewards shall be paid *immediately after condemnation*, after deducting 10*l.* per cent. for expenses.

Sect. 5. of last-mentioned act, directs that any person, a subject of Great Britain, seized on board a vessel liable to forfeiture as aforesaid, shall be liable to be carried before a justice and convicted, in a penalty of 100*l.* and be thereupon sent to serve in his majesty's navy, or be imprisoned in gaol, or house of correction, till such penalty be paid; and the offence shall not be bailable.

Sect. 7. directs condemnation of the vessels and cargoes, though no owner appear.

Sect. 8. and 9. adjust the distribution of forfeitures, and subject persons obstructing seizures to a penalty of 200*l.*

The law of excise relating to the warehousing system is amended by 1 & 2 Geo. 4. c. 105. by which, amongst other things, the decrease of quantity in warehoused excisable articles, arising from natural waste, is allowed for in charging the duties on such articles, when they are taken out of the warehouse. *And see* WAREHOUSE.

The excise laws relating to the duties on beer, &c. are amended by stat. 1 & 2 Geo. 4. c. 22. which contains provisions to prevent frauds by brewers; and no beer, &c. can be sent out by the brewer without the certificate and entry mentioned in the act.

For excise laws relating to *Salt, Tobacco, and Paper*, see those Articles.

EXECUTION is a judicial writ, grounded on the judgment of the court from whence it issues; by which the party obtains compensation for the damages he has sustained.

An execution may be against the goods, the goods and profits of the land, and against the body, land, and goods.

Where the body of the debtor is imprisoned, until satisfaction be made for the debt, together with the costs and damages, no other process can be sued out against his lands or goods; but if he die whilst charged in execution upon this writ, new executions may be sued out against his lands, goods, or chattels.

If two writs of execution come to the sheriff on the same day, he ought to execute that first which was first received.

Nothing can be taken in execution that cannot be sold, as deeds and writings: so also bank-notes cannot be taken in execution.

Goods of a stranger in the defendant's possession, cannot be taken in execution.

The sale of goods for a valuable consideration, after judgment and before execution, will be good: but where a man keeps possession of his goods after sale, such sale, by the statute of frauds, will be void.

When a plaintiff obtains judgment, it is at his election to sue out what writ of execution he thinks proper; but he cannot regularly take out two different writs of execution upon the same judgment, nor a second of the same nature, unless upon failure of satisfaction in the first.

No person can sue out an execution but such as is privy to the judgment, or entitled to the thing recovered, as heir, executor, or administrator, to the party who recovers the judgment.

No execution can be taken out against a member of parliament, during privilege of parliament; nor can any *capias* issue against a peer.

Priority and Proceedings of Execution.—Lands are bound from the time of the judgment; and also statute-merchant, statutes-staple, and recognizance, which also bind the lands from the time of entering them.

No judgment, which shall not be entered in the several courts, and regularly docketed, pursuant to act of parliament, shall affect any lands or tenements as to purchasers or mortgagees, or have any preference against heirs, executors, or administrators in their administration of their ancestors, testators, or intestate estates; but execution for the king's debt, or prerogative execution, is always preferred before any other execution. 7 *Rep.* 20.

No writ of execution shall bind the property of the goods but from the time such writ shall be delivered to the sheriff, or other officer, to be executed; and for better ascertaining the time, the sheriff, or other officer, shall indorse upon such writ the day of the month, and year, when the same was received.

The property of goods, taken in execution, is bound only from the delivery of the writ to the sheriff, with respect to purchases only; but where the party dies after the teste, and before execution, the property shall be bound from the teste.

Within what Time Execution is to be sued out.—This must be generally within a year and a day after the judgment, but the judgment may be revived; and if the plaintiff hath a judgment, with a stay of execution for a year, he may, after the year, take out his execution.

It is a general rule, that in executing any of the writs of execution, the sheriff cannot break open the door of a dwelling-house, unless in very special instances, where, at the suit of the king, or in obtaining possession under an ejectment, the sheriff, if denied entrance by the tenant, may justify breaking open the door.

This privilege also of a man's home relates to such executions as affect himself individually; and, therefore, if a writ be directed to the sheriff against the goods of A. which are in the house of B. if after request made, B. refuses to deliver these goods, the sheriff may justify breaking in and seizing them; and when the sheriff, or his officers, are once within the house, they may break open any chamber, door, or trunks, for completing the execution. 3 *Black. Com.* 418.

EXECUTION of *Criminals* in all cases, as well capital as otherwise, must be performed by the legal officer, the sheriff or his deputy; whose warrant for so doing was anciently by precept under the hand and seal of the judge, as it is still practised in the court of the lord high steward, upon the execution of a peer, 2 *Hal. P. C.* 409.; though, in the court of the peers in parliament, it is done by writ from the king. However, in general, the usage is, for the judge to sign the calendar, or list of all the prisoners' names, with their separate judgments in the margin, which is left with the sheriff.

If the sheriff receive afterwards no special order from the judge, he executes the judgment of the law in the usual manner, agreeably to the directions of his calendar.

If the judge thinks it proper to reprieve a capital convict, he sends a memorial or certificate to the king's most excellent majesty, directed to the secretary of state's office, stating that, from favourable circumstances appearing at the trial, he recommends the offender to mercy, *on conditions*, or otherwise.

The sheriff upon receipt of his warrant is to do execution within a convenient time; which in the country is also left at large. In London a more solemn exactness is used, both as to the warrant of execution, and the time of executing thereof: for the recorder, after reporting to the king in person the case of the several prisoners, and receiving his royal pleasure, that the law must take its course, issues his warrant to the sheriffs; directing them to do execution on the day, and at the place, assigned.

The sheriff cannot alter the manner of the execution by substituting one death for another, without being guilty of felony himself. 2 *Hawk. P. C.* 463.

To conclude: it is clear, that if, upon judgment to be hanged by the neck till he is dead, the criminal be not thoroughly killed, but revives, the sheriff must hang him again. 2 *Hal. P. C.* 412. 2 *Hawk. P. C.* 462.

EXECUTOR is a person appointed by the testator to carry into execution his will and testament after his decease. The regular mode of appointing an executor is by naming him expressly in the will; but any words indicating an intention of the testator to appoint an executor will be deemed a sufficient appointment. Any person capable of making a will, is also capable of being an executor; but in some cases, persons who are incapable of making a will, may nevertheless act as executors, as infants, or married women; to obviate, however, inconveniences which have occurred respecting the former, it is enacted by stat. 38 Geo. 3. c. 89. that where an infant is sole executor, administration, with the will annexed, shall be granted to the guardian of such infant, or such other person as the

spiritual court shall think fit, until such infant shall have attained the age of twenty-one; when, and not before, probate of the will shall be granted him. An executor derives his authority from the will, and not from the probate, and is therefore authorized to do many acts in the execution of the will, even before it is proved, such as releasing, paying, or receiving debts, assenting to licences, &c. but he cannot proceed until he has obtained probate. If an executor die before probate, administration must be taken out with the will annexed; but if an executor die, his executor will be executor to the first testator, and no fresh probate will be needed. It will be sufficient if one only of the executors prove the will; but if all refuse to prove, they cannot afterwards administer, or in any respect act as executors. If an executor become a bankrupt, the Court of Chancery will appoint a receiver of the testator's effects, as it will also upon the application of a creditor, if he appear to be wasting the assets.

If an executor once administer, he cannot afterwards renounce; and the ordinary may, in such cases, issue process to compel him to prove the will. 1 *Mod.* 213.

If a creditor constitute his debtor his executor, this is at law a discharge of the debt, whether the executor act or not, provided, however, there be assets sufficient to discharge the debts of the testator. The first duty of an executor or administrator is to bury the deceased in a suitable manner; and the next thing to be done by the executor is to prove the will.

By stat. 37 Geo. 3. c. 9. s. 10. every person who shall administer to the personal estate of any person dying without proving the will of the deceased, or taking out letters of administration within six calendar months after such person's decease, shall forfeit 50*l.* Upon proving the will, the original is to be deposited in the registry of the ordinary, by whom a copy is made upon parchment under his seal, and delivered to the executor or administrator, together with a certificate of its having been proved before him, and this is termed the probate. If all the goods of the deceased lie within the same jurisdiction, the probate is to be made before the ordinary or bishop of the diocese where the deceased resided; but if he had goods and chattels to the value of 5*l.* in two distinct dioceses or jurisdictions, the will may be proved before the metropolitan or archbishop of the province in which the deceased died. An executor, by virtue of the will of the testator, has an interest in all the goods and chattels, whether real or personal, in possession or in action, of the deceased; and all goods and effects coming to his hands will be the assets to make him chargeable to the creditors and legatees.

An executor or administrator stands personally responsible for the due discharge of

his duty; if, therefore, the property of the deceased be lost, or through his wilful negligence becomes otherwise irrecoverable, he will be liable to make it good; and also where he retains money in his hands longer than is necessary, he will be chargeable not only with interest but costs, if any have been incurred. An executor or administrator has the same remedy for recovering debts and duties, as the deceased would have if living.

By the custom of merchants, an executor or administrator may indorse over a bill of exchange or promissory note. An executor or administrator may also, on the death of a lessee for years, assign over the lease, and shall not be answerable for rent after such assignment; nor shall he be liable for rent due after the lessee's death, from premises which in his life-time he had assigned to another.

The executor or administrator, previously to the distribution of the property of the deceased, must take an inventory of all his goods and chattels, which must, if required, be delivered to the ordinary upon oath. He must then collect, with all possible convenience, all the goods and effects contained in such an inventory; and whatever is so recovered that is of a saleable nature, and can be converted into money, is termed assets, and makes him responsible to such amount to the creditors, legatees, and kindred of the deceased.

The executor or administrator having collected in the property, is to proceed to discharge the debts of the deceased, which he must do according to the following priorities, otherwise he will be personally responsible. 1. Funeral expenses, charges of proving the will, and other expenditures incurred by the execution of his trust. 2. Debts due to the king on record, or by specialty. 3. Debts by particular statutes; as by 30 Car. 2. c. 23. Money due for poor-rates, and to the post-office. 4. Debts on record, as judgments, statutes, recognizances, and those recognized by a decree of a court of equity, and debts due on mortgage. 3 *Peere Wms.* 401. 5. Debts on special contracts, as bonds or other instruments under seal, and also rent in arrear. 6. Debts on simple contract, viz. such as debts arising by verbal promise, or by writing not under seal, as notes of hand, &c. The executor is bound to take notice of debts on records, if properly doggetted, according to the statute, but not of other contracts, unless he receive notice. If no suit is commenced against an executor or administrator, he may pay one creditor in equal degree the whole debt, though there should be insufficient remaining to pay the rest; and even after the commencement of a suit, he may, by confessing judgment to other creditors of the same degree, give them a preference. Executors and administrators are also al-

lowed, amongst debts of equal degree, to pay themselves first, but they are not allowed to retain their own debt, to the prejudice of others, in a higher degree; neither shall they be permitted to retain their own debts, in preference to that of their co-executor or co-administrator, of equal degree, but both shall be charged in equal proportion.

EXECUTOR *de son tort*, or an executor of his own wrong, a person that takes upon him the office of an executor, by intrusion, without being so constituted by the testator, or appointed by the ordinary to administer. Such a person is chargeable to the rightful executor, as also to all the testator's creditors and legatees, so far as the goods, which he wrongfully possessed, amount to.

EXPORTATION, the act of sending goods out of one country into another. In modern times it has been the principal object of commercial policy, in almost every country, to encourage exportation, except with respect to a few particular articles; the export of manufactured goods has been promoted with the view of encouraging the internal industry of the country; and the export of foreign produce, as a mean of drawing wealth from other countries by the profits of the carrying trade. The excess of the value of goods exported, beyond that of the imports, has usually been considered as a criterion of the profits which a country derives from foreign trade. The laws in force relating to importation consist principally of prohibitory or restrictive regulations respecting bullion, corn, wool, machinery, and tools used in various branches of manufactures, the exportation of which, it is thought, might diminish the necessary supply of provisions for the consumption of the country, or enable foreigners to rival valuable branches of its manufactures. The acts relative to the exportation of wool prohibit not only that of the article itself, but of live sheep, rams, or lambs, from Great Britain, Ireland, Jersey, Guernsey, Alderney, Sark, and Man, on penalty of the forfeiture thereof, and of the ships conveying the same; also 8*l.* for every sheep, &c. and the offender to suffer three months' solitary imprisonment; for a second offence, 5*l.* per sheep, &c. and six months' imprisonment: except wether sheep for ship's use only, put on board by licence of the port officer of the customs. A limited quantity of wool is, however, permitted to be exported from the port of Southampton to Jersey, Guernsey, Alderney, and Sark. 28 Geo. 3. c. 38.

And no sheep's wool, wool-fells, mortlings, shortlings, yarn made of wool, wool-flocks, fullers'-earth, fulling-clay, or tobacco-pipe-clay, shall be exported out of England, Wales, or Berwick, under penalty of forfeiture of the vessel, and treble costs; and persons assisting in exporting the same, shall suffer three years' imprisonment.

No English coin, nor bullion, unless first

stamped at Goldsmiths' hall, and oath made that no part of it was the current coin of this realm, or clippings thereof, or plate wrought within this kingdom, can be exported under penalty of forfeiture of the bullion, and imprisonment of the owner, by 7 & 8 W. 5. c. 17. : but by 43 Geo. 3. c. 49. a considerable relaxation of the former act is provided respecting bullion. *See title BULLION.*

All goods shipped before the custom duties are paid, shall be forfeited. No person shall take on board any ship beyond sea, any English goods or merchandise, until they are first entered in the books of the proper officer of the customs, outwards; and shall bring to such officer the contents in writing under his hand, of the names of the persons who shall have laden on board any goods, together with the mark or number thereof, under penalty of 100*l*.

Wharfingers, or keepers of cranes or quays, suffering uncustomed or prohibited goods to be landed upon their wharfs or quays or shipped on board from thence, without the presence of some officer of the customs, shall forfeit 100*l*.

Year.	British Produce and Manufactures.	Foreign and Colonial Merchandise.	Total Exports.

EXTENT, signifies a writ or commission to the sheriff for the valuing of lands or tenements; and sometimes the act of the sheriff or other commissioners upon this writ.

This process is issued against persons who, being in the receipt of any part of the public

Goods exported and carried coastwise without a cocket or sufferance from the Custom-house, are forfeited; and masters of vessels shall take out cockets where such goods were laden, and give bond and security that they shall be landed at the place for which they were entered, or some other within the United Kingdom, and shall return a certificate within six months, (danger of the seas excepted,) from the custom-house, at the port where such goods were unladed, to the officer to whom the security was given, otherwise, the bond and security will be forfeited.

No goods can be exported or imported in a packet-boat (unless allowed by the chief officer of the customs), under penalty of forfeiture, and 100*l*. upon the master of such vessel.

The following is an account of the *official value* of the exports from Great Britain in each year from 1792 to 1820, both inclusive, distinguishing the value of British produce and manufactures from that of foreign and colonial merchandise. *See further COMMERCE, CUSTOMS, REVENUE.*

revenue, as excise, or other taxes, fail in payment of them to the boards or other persons authorised to receive them. *Wild v. Fort, 4 Taunt. Rep. 334.*

EXTENT *in aid*, is a similar process, which the debtor to the crown can sue out against any other person indebted to him,

by means of which he is himself rendered unable to liquidate his said obligation to the crown.

Extents in aid, towards the end of the last reign, were extremely oppressive from the circumstance of persons liable to duties, as manufacturers, &c. being allowed to use the prerogative process to sweep away all the estate of bankrupts and insolvents, to the detriment of other creditors. This abuse has been, in a great measure, remedied by stat. 57 Geo. 3. c. 117.

EXTORTION, is the unlawfully taking, by colour of office, from any person, any money or other thing of value that is not due, or more than due, or before the same be

due: this offence is a high abuse of public justice, and is punished by fine and imprisonment, and sometimes by forfeiture of office.

EYE, in printing, is sometimes used for the thickness of the types; or, more properly, it signifies the graving in relief on the top of the letter, otherwise called its face: the eye of the *e* is the small opening at the head of that letter, which distinguishes it from the *c*.

EYE of the anchor, on board a ship, the hole in which the ring of the anchor is put into the shank.

EYE of the strap, on board a ship, the ring or round which is left to the strap to which any block is seized.

F A C

F, the sixth letter of the alphabet. As a numeral it denotes 40, and with a dash over it, thus, F, denotes 40,000. In medicine, F stands for *fiat*, "let it be done:" thus F. S. A. stands for *fiat secundum artem*, "let it be done according to art."

FACET, or FACETTE, among jewellers, the name of the little faces or planes to be found in brilliant and rose diamonds.

FACTOR, in commerce, is an agent or correspondent residing beyond the seas, or in some remote part, commissioned by merchants to buy, or sell, goods on their account, or assist them in carrying on their trade. A factor receives from the merchants or manufacturers, &c. in lieu of wages, a commission, or factorage, according to the usage of the place where he resides, or the business he transacts, this being various in different countries, and on the purchases and sales in different commodities. He ought to keep strictly to the tenor of his orders; as a deviation from them, even in the most minute particular, exposes him to make ample satisfaction for any loss that may accrue from his non-observance of them. When unlimited orders are given to factors, and they are left to sell, or buy, on the best conditions they can, whatever detriment occurs to their principals, they are excused, as it is to be presumed they acted for the best, and were governed by the dictates of prudence. But a bare commission to sell is not authority for the factor to trust any person; he ought to receive the money on delivery of the goods; and by the general power, he may not trust above the usual time allowed in sales, otherwise he shall be answerable; nor can he pledge the goods of his principal. If he sell on the usual terms to a person of reputed good credit, who afterwards becomes insolvent, he is discharged; but not if the man's credit was bad at the time of sale. A factor should be punctual in the advices of his transactions, in sales, purchases, freights, and more espe-

F A C

cially bills of exchange: he should never deviate from the orders he receives in the execution of a commission for purchasing goods, either in price, quality, or kind; and if, after goods are bought, he sends them to a different place from what he was directed to, they must remain for his own account, except the merchant or manufacturer, on advice of his proceedings, admit them according to his first intention. A factor that sells a commodity under the price he is ordered, shall be obliged to make good the difference; and if he purchase goods for another at a price limited, and afterwards they rise, and he fraudulently takes them for his own account, and sends them to another part, in order to secure an advantage that seemingly offers, he will, on proof, be obliged, by the custom of merchants, to satisfy his principal for damages. If a factor, in conformity with a merchant's orders, buy with his money, or on his credit, a commodity he shall be directed to purchase, and, without giving advice of the transaction, sell it again to profit, and appropriate to himself the advantage, the merchant shall recover it from him, and besides have him amerced for his fraud. A factor who enters into a charter-party with a master for freight, is obliged by the contract; but if he loads aboard generally, the principal and the lading are liable for the freight, and not the factor. If a factor, having money in his hands belonging to his principal, neglect to insure a ship and goods, according to order, if the ship miscarry, the factor, by the custom of merchants, shall make good the damage; and if he make any composition with the insurers after insurance, without orders so to do, he is answerable for the whole insurance.

As fidelity and diligence are expected from the factor, so the law requires the like from the principal; if, therefore, a merchant consign counterfeit jewels, &c. to his factor, who sells them as if true; if such factor re-

celve loss or prejudice, the principal shall not only make full satisfaction to him, but to the party who bought the jewels, &c. What is here said of factors, is meant of such as reside abroad to act for merchants; but may be applied to supercargoes, who go a voyage to dispose of a cargo, and afterwards return with another to their principals. It is the custom of merchants to act mutually in the capacity of factors for each other. The business so executed is called commission-business, and they have current, as well as commission, accounts constantly between them; and draw on, remit to, and send commissions to each other by the intercourse of letters. See *ante* CHARTER-PARTY.

FACTORAGE, or **COMMISSION**, is the allowance given to factors by the merchants and manufacturers, &c. who employ them: it is a per centage on the goods they purchase, or sell, for account of their principals, and varies according to circumstances. A factor's commission in Great Britain and Ireland is from 2 to $2\frac{1}{2}$ per cent.: on lead and some other articles, 2 per cent.; in Italy, $2\frac{1}{2}$ per cent.; in France, Holland, Hamburg, Dantzic, St. Petersburg, and in Spain, Portugal, &c. 2 per cent.; in Turkey, 3 per cent.; in America, 5 per cent. on sales, and the same on returns; in the West Indies, 8 per cent. for commission and storage. In many places it is customary for factors to insure the debts for an additional commission, called a *del credere* commission, and generally from $1\frac{1}{2}$ to 2 per cent. In that case they are accountable for the debt, when the credit expires. Factorage or commission is frequently charged at a certain rate per cask, or other package, measure, or weight, especially when the factor is only employed to receive or deliver, and this commission is usually charged according to a special agreement between the merchant and factor.

FACTORY, is a place where a considerable number of merchants and factors reside, to negotiate business for themselves and their correspondents on commission. We have factories in the East Indies, Turkey, Portugal, Russia, &c.

FAGG, in the sea language, a term given to the end of those strands which do not go through the tops, when a cable or rope is closed.

FAILURE, is where a tradesman, through misfortune or imprudence, is unable to pay his debts, which may happen from trading beyond his capital, or negligence in keeping his accounts, or misfortunes in trade. See **BANKRUPT**.

FAIR, a greater kind of market, granted to a town, by privilege, for the more speedy providing of such things as the place stands in need of. It is incident to a fair, that persons shall be free from being arrested in it for any other debt or contract than what was contracted in the same, or at least pro-

mised to be paid there. Also proclamation is to be made how long they are to continue; and no person shall sell any goods after the time of the fair is ended, on forfeiture of double the value, one-fourth to the prosecutor, and the rest to the king. There is a toll usually paid in fairs, on the sale of things, and for stallage, picage, &c. Fairs abroad are either free, or charged with toll and imposition. The privileges of free fairs consist chiefly, first, in that all traders, &c. whether natives or foreigners, are allowed to enter the kingdom, and are, under protection, exempt from duties, impositions, tolls, &c. Secondly, that merchants, in going or returning, cannot be molested or arrested, or their goods stopped. They are established by letters patent from the prince. Fairs, particularly free fairs, are very considerable auxiliaries to the commerce of Europe, especially that of the Mediterranean, Germany, &c.

Some of the principal British fairs are: 1. Sturbridge fair, near Cambridge. 2. Bristol, two fairs. 3. Exeter. 4. West Chester. 5. Edinburgh. 6. Weyhill; and, 7. Burford fair, both for sheep. 8. Pancras fair, in Staffordshire, for saddle-horses. 9. Bartholomew fair, in London. 10. St. Faith's, in Norfolk, for Scotch runts. 11. Yarmouth fishing-fair, for herrings, the only fishing-fair in Great Britain. 12. Ipswich butter-fair. 13. Woodborough-hill, in Dorsetshire, for west-country manufactures, as kerseys, druggets, &c. 14. Two cheese-fairs at Chipping Norton. 15. One ditto at Nottingham. 16. Howden and Borough-bridge fairs, in Yorkshire, for Holderness cows, and Yorkshire hunters. 17. Horn-castle, in Lincolnshire, for horses of all kinds; and Harborough, in Leicestershire, for Scotch cattle, to be fed on the Essex and Norfolk marshes for the supply of the London markets in winter.

Among the principal free fairs in France were those of St. Germain, Lyons, Rheims, Chartres, Rouen, Bourdeaux, Troyes, Bayonne, Dieppe, &c. The most noted fairs in Germany are those of Frankfort, Leipsic, and Nuremburg; not only on account of the great trade, but the vast concourse of princes of the empire, nobility, and people who come to them from all parts of Germany to partake of the diversions. There are also other fairs much resorted to, as Zurich, in Switzerland, Novi, in the Milanese, Sinigaglia, in the duchy of Urbino, Italy, Riga, in Livonia, Rama, in the Holy Land, Porto Bello, La Vera Cruz, and the Havannah, in Spanish America.

The emperor of Russia has also recently proclaimed an annual fair at Warsaw; and there has long been one at Archangel, in the same monarch's dominions.

The following are some of the regulations relative to fairs in Great Britain:

Owners and governors of fairs are to take

care that every thing be sold according to just weights and measures; and for this and other purposes, are to appoint a clerk of the fair or market, who is to mark and allow all such weights, taking for the same only just and reasonable fees.

Tolls payable at a fair or market, is a reasonable sum of money due to the owner of such fair, upon sale of tollable commodities, as for stallage, picage, &c.

Every sale in a fair or market overt, effectually transfers the property to the vendee, however injurious or illegal to the title of such vendor.

A court of the clerk of the market is incident to every fair and market, to punish misdemeanors committed therein, as well as a court of *pie-powder*, to determine all disputes relative to civil property. The object of this jurisdiction is principally the cognizance of the weights and measures; which, if not according to the standard required by law, exclusive of the punishment by fine to the party, may be destroyed.

No goods in a fair or market can be distrained for rent; but if they are on their way, or put into a pasture, they may be distrained.

Any citizen of London may carry his goods or merchandise to any fair or market in England, at his pleasure.

Owners of tolls or markets are to appoint toll-takers or book-keepers, on pain of 40s.

Fairs are commonly annual, and were formerly granted to be held on the dedication of the church, upon which day many fairs are yet held; and they were first held in churches, and afterwards in church-yards, until a particular act of parliament was made to prohibit this practice.

Persons taking unreasonable toll shall be punished; and what shall be deemed reasonable is to be decided by the judges, if the question comes judicially before them.

FAKE, among sailors, signifies one round or circle of a cable, or hawser, coiled up out of the way.

FALCHION, a short, crooked sword, not much in use at present.

FALL, is the name of a measure of length used in Scotland, containing six ells.

FALL, in the sea language, that part of the rope of a tackle, which is hauled upon. Also when a ship is under sail, and keeps not so near the wind as she should do, they say "she falls off;" or when a ship is not flush, but has risings in some parts of her decks more than others, they are called falls.

FAN, (*Fans*. GER. *Fächer*. DU. *Waaajers*. DA. *Vifter*. SW. *Solfjadrar*. FR. *Eventails*. IT. *Ventagli*. SP. *Abanicos*. PORT. *Abonos*. RUS. *Opachalu*. POL. *Wachlarz*.) an instrument used by ladies to move the air, and cool themselves. There are a few wholesale fan-dealers established at London, and in some other parts of Great Britain, who carry on a profitable trade in this trifling article.

FANO, a small weight used at Goa, and other parts of the East Indies, for weighing rubies, equal to two Venetian carats.

FANON, or FANOS, a current coin on the coast of Malabar, Coromandel, in the island of Ceylon, and several other parts of India; they are both of gold and silver, and differ in their value in different places, according to the goodness of the metal. The heaviest are not worth above five-pence half-penny sterling, and the lightest not more than five farthings. They weigh seven grains; but the gold is of so base an alloy, that twenty-two of them scarcely make half a crown: these are made at Asem; and those of Pegu are of the same weight, but being purer metal, fifteen of them are of equal value with the above. There are golden fanons at Pondicherry, worth about three-pence-halfpenny. They are made like the half of a pea, and are not bigger. Twelve dondorees are given for this fanon, and two caches for the dondore. The silver fanos are worth about two-pence sterling; twenty of them are equal to the pardo, a Portuguese money made at Goa.

FARATELLE, a weight used in some parts of India, equal to two Portuguese pounds, of fourteen ounces marc, or to 1 lb. 14 oz. British.

FARTHING of copper, a coin, and the smallest in Britain, equal in value to one-fourth of a penny sterling.

FASCETS, in the art of making glass, are the irons thrust into the mouths of bottles, in order to convey them into the annealing tower.

FAT, in the sea language, signifies the same with broad. Thus a ship is said to have a fat quarter, if the trussing in or tack of her quarter is deep.

FAT, properly vat, (vas or vessel,) denotes likewise an uncertain measure of capacity. Thus, a fat of isinglass contains from $3\frac{1}{4}$ cwt. to 4 cwt.; a fat of unbound books, half a maund, or four bales; of wire, from 20 to 25 cwt.; and of yarn, from 220 to 221 bundles.

FATHOM, a long measure, containing six feet, chiefly used at sea for measuring the length of cables and cordage.

FAYALLE, an imaginary money, valued by some as the pistole of France, viz. ten livres, and by others twelve livres and a half, which difference proceeds from the first valuation made on the French livre of 20 sous, and the other on the livre or guilder of Holland, worth 25 sous. It is equivalent to about 8s. 4d. sterling.

FEATHERS, (*Bed-feathers*. GER. *Federn*, *Bettfedern*. DU. *Bedveern*, *Pluimen*. DA. *Fiere*, *Sengefierce*. SW. *Fjadrar*. FR. *Plumes*, *Plumes à lit*. IT. *Piume*. SP. and PORT. *Plumas*. RUS. *Pera*. POL. *Piora*.) make a considerable article of commerce, particularly those of the ostrich, heron, swan, peacock, goose, &c. for plumes, or-

naments of the head, filling of beds, writing-pens, &c. The coarsest part of the ostrich plumage is generally denominated *hair*, to which it bears a resemblance, and is used in the composition of hats. Many parts of Great Britain supply feathers for beds, and an inferior sort is brought from Ireland. Eider down is imported from Denmark; the ducks that supply it being inhabitants of Hudson's Bay, Greenland, Iceland, and Norway. All the islands west of Scotland breed numbers of these birds, which are a profitable branch of trade to the poor inhabitants. Hudson's Bay also furnishes very fine feathers. The down of the swan is brought from Dantzick, as also are large quantities of inferior feathers. The best method of curing them is to lay them in a room exposed to the air and sun; and when dried, to put them in coarse bags, and beat them well with poles to get out the dirt, &c.

FEATHER EDGE, boards or planks that have one edge thinner than another, are called *feather edges*.

FEE, denotes a settled perquisite of public officers, payable by those who employ them. The fees due to the officers of the Custom-house are expressly mentioned in a schedule, or table, which is hung up in public view in the said office, and in all other places where the said fees are to be paid or received. And if any officer shall offend, by acting contrary to the regulations therein contained, he shall forfeit his office and place, and be for ever after incapable of any office in the Custom-house. By stat. 1 Geo. 4. c. 7. s. 5. reciting 51 Geo. 3. c. 71. s. 10. a penalty of 200*l.* is imposed for the offer of the fee, prohibited by those acts, to the officers, &c. of the customs. The other public offices have likewise their settled fees, for the several branches of business transacted in them.

FELLMONGER, is a person who buys up the skins of sheep and lambs, pulls the wool, and makes the sheep-skins into leather for breeches, &c. &c.

FELLOWSHIP, or Company, in commerce, is when two or more join their stocks and trade together, dividing their gain or loss proportionably. Fellowship is either with, or without, time. Questions without time, or in the single rule of fellowship, as it is frequently called, are wrought by the following proportion: As the whole stock is to the whole gain or loss, so is each man's particular stock to his particular gain or loss.—Example 1. A, B, and C, make a joint stock; A puts in 460*l.* B, 510*l.* and C, 480*l.* they gain 340*l.* what part of it belongs to each?

In order to the solution of this question, find the total of their joint stock, viz. — A's stock 460*l.* + B's stock 510*l.* + C's stock 480*l.* = 1450*l.* the total stock.

Then, 1. To find A's share of the gain, state as follows: If 1450*l.* : 340*l.* :: 460*l.*

which being worked by the rule of three, the answer will be, 107*l.* 17*s.* 2*½d.* for A's share of the profit.

2. B's share of the gain by stating thus: If 1450*l.* : 340*l.* :: 510*l.* and working by the rule of three, will be found to be 119*l.* 11*s.* 8*½d.*

3. C's share will appear 112*l.* 11*s.* 0*¼d.* when worked as before, being stated thus: If 1450*l.* : 340*l.* :: 480*l.*

Example 2.—Suppose three partners, A, B, and C, make a joint stock in this manner: A puts in 24*l.* B, 32*l.* and C, 40*l.* in all 96*l.* with which they trade, and gain 12*l.* required each man's true share of that gain? The first operation for A's part of the gain will stand thus:

96*l.* : 12*l.* :: 24*l.* : 3*l.* = A's gain.

96*l.* : 12*l.* :: 32*l.* : 4*l.* = B's gain.

96*l.* : 12*l.* :: 40*l.* : 5*l.* = C's gain.

Proof 3*l.* + 4*l.* + 5*l.* = 12*l.* the whole gain.

That is, if the total of all their particular gains amounts to the whole gain, the work is true; if not, some mistake has been committed.

Fellowship with time, usually called the *double rule of fellowship*, because every man's money is to be considered with relation to the time of its continuance in the joint stock. It is worked thus: Multiply each man's stock by the respective time he puts it in for, and add all the products; the total of which must be your first number through all the statings; the gain or loss the second, as before; and each man's particular stock, multiplied by its time, the third.

Example 1.—A put into company 560*l.* for eight months, B, 279*l.* for ten months, and C, 735*l.* for six months; they gain 1000*l.* What share of it must each have?

For the solution of this question, proceed as follows: A's stock 560*l.* × 8 its time, = 4480; B's stock 279*l.* × 10 its time, = 2790; C's stock 735*l.* × 6 its time, = 4410. Then 4480 + 2790 + 4410 = 11680. Now, 1. To find A's share of the profit, state thus: If 11680*l.* : 1000*l.* :: 4480*l.* which being worked by the rule of three, the answer will be, 383*l.* 11*s.* 2*¾d.* for A's share of the gain.

2. For finding B's share, state thus: If 11680*l.* : 1000*l.* :: 2790*l.* and working as before directed, the answer will be, 238*l.* 17*s.* 4*¾d.*

3. To find C's proportion of the gain, say: If 11680*l.* : 1000*l.* :: 4410*l.* then working it by the rule of three, the true amount of his share will appear to be, 337*l.* 11*s.* 4*¾d.*

FELT, (GER. *Filz*. DU. *Vilt*, *Vilte*. DA. and Sw. *Filt*. FR. *Feutre*. IT. *Feltra*. SP. *Fieltro*. PORT. *Felvro*. RUS. *Woiok*. POL. *Pils'n*. LAT. *Coactila*.) a sort of stuff deriving all its consistence merely from being fulled or wrought in warm water, without either spinning or weaving. Felt is made either of wool alone, or of wool and hair. The term is principally employed in the

manufacture of hats. It is likewise used to signify the coarsest species of woollen hats, which are, for the most part, exported to the West Indies, for the use of the negroes.

FELUCCA, a little vessel with six oars, frequent in the Mediterranean, which has this peculiarity, that its helm may be applied either in the head or stern, as occasion requires.

FEND, in the sea language, imports the same as defend: thus, "fending the boat," is saving it from being dashed to pieces against the rock, shore, or ship's side.

FENDER, a guard or inclosure, composed of iron, steel, or brass, and laid before the fire to hinder coals, cinders, &c. that fall, from rolling forward to the floor. Fenders are made in the highest perfection at Birmingham and Sheffield. The steel-fenders made at these places are so admirably finished, that they frequently fetch from five to fifteen or twenty guineas in the English market, and still more in foreign countries.

FENDERS are pieces of old hawsers, cables, or billets of wood, hung over the ship's side, to keep other ships from rubbing against and injuring them.

FENNEL-SEED, (GER. *Fenchel*. DU. *Venkel*. DA. *Fennikel*. SW. *Fankol*, *Fenkal*. FR. *Fenouil*. IT. *Finocchio*. SP. *Hinojo*. PORT. *Funcho*. RUS. *Woloskoi ukrop*. POL. *Koprutosky*. LAT. *Feniculum*.) of which there are two sorts, the common, and the sweet. Both are cultivated in our gardens: the common is a perennial plant; the sweet fennel perishes after it has seeded, but its seed does not come to perfection in this climate. Of the first species, the fennel, both the seeds and roots are used in medicine. The seeds of both have an aromatic smell, and a moderately warm taste: those of the sweet are of an agreeable flavour, with a considerable degree of sweetness. They are considered as stomachics. Fennel is cultivated in Holland, France, and Italy in great abundance.

FENUGREEK, (GER. *Bockshornsaamen*, *Fönugrek*. DU. *Bokshoornzaad*, *Fenegriek*. DA. *Fonugræk*. SW. *Fenugrek*. FR. *Fenu-grec*, *Senegré*. IT. *Fienogreco*. SP. *Alforva*, *Alholva*. PORT. *Alforvas*, *Fenogrego*. LAT. *Fænum græcum*.) is a seed of very singular figure, about the size of hempseed, of a pale yellowish colour, wrinkled surface, heavy, and extremely firm; it is used in medicine, and comes to us from Germany, and other countries, where it is cultivated in the fields. The plant which yields this seed is grown in abundance at Auberwilliers, near Paris, where it is esteemed excellent fodder for cattle.

FERMENTATION, is that change in the principles of organic bodies which begins to take place spontaneously, as soon as their vital functions have ceased; and by which

they are at length reduced to their first principles. This may be distinguished into three species: the vinous or spirituous, the acid or acetous, and the putrid fermentation.

The vinous fermentation only takes place in such bodies as contain saccharine matter. The principal product of this is a volatile, pungent, inflammable fluid, which, when in a state of purity, is termed *alcohol*.

The acetous fermentation is distinguished by the product known by the name of *vinegar*, or in a state of purity *acetic acid*.

In the putrid fermentation, bodies appear to be reduced to their most simple elements. The chief product in the early part of this process is *ammonia*.

Vegetable substances alone are susceptible of vinous and acetous fermentation; the putrid is common to both vegetable and animal bodies.

The decomposition of bodies is retarded by low temperature, and exclusion from the air; it is favoured by slight agitation, free exposure to the air, and a certain degree of heat. See VINEGAR, and DISTILLATION.

FERRY, is a liberty by prescription, or the king's grant, to have a passage-boat upon a river, for carriage of horses and men, at a reasonable toll. *Savil*, 11 and 14. The owner of a ferry cannot suppress that ferry, and put up a bridge in its place, without a licence. *Show*, 245. 257. So says the old law, but few persons would find fault with such an exchange now. If a bridge, however, be put in the place of a ferry, the person so erecting it is bound to maintain and keep it in repair, except under special circumstances. 43 Geo. 5 c. 59. Not keeping up a ferry, being a common passage for all the king's people, is also indictable, as well as not keeping up bridges. 1 *Salk*. 12.

An exclusive right to a ferry from A to B does not prevent persons going by any other boat from A directly to C, though C be very near to B, provided it be not done fraudulently, and as a pretence for avoiding the regular ferry. *Tripp v. Frank*, 4 T. Rep. 666.

FIDD, in the sea language, an iron or wooden pin, to splice and fasten ropes together. It is made taperwise, and sharp at one end. The pin in the heel of the topmast, which bears upon the chess-trees, is likewise called a fidd.

FIDDLE, (Fiddles. GER. *Violinen*, *Geigen*. DU. *Vioolen*. DA. *Fioler*. SW. *Fioler*. FR. *Violons*. IT. *Violini*. SP. *Violines*. PORT. *Rebecas*. RUS. *Sskripitzii*. POL. *Skrzypce*.) likewise denominated a violin, is a stringed musical instrument, too well known to need any particular description. The finest toned violins are those made in Italy; they are usually called Cremonas, from the name of an Italian town, where those instruments were formerly manufactured.

tured in the highest perfection. Fifty or sixty guineas are not an uncommon price for a Cremona-violin.

FIFE, or **FIFFARIO**, a shrill wind-instrument of the martial kind, consisting of a short narrow tube, with holes disposed along the side, for the regulation of its tones. It is not blown at the end, but at the side, like a German flute.

FIGS, (GER. *Feigen*. DU. *Vygen*. DA. *Figen*. SW. *Fikon*. FR. *Figues*. IT. *Fichi*. SP. *Higos*. PORT. *Figos*. RUS. *Winnia jagodi*. POL. *Fiki*. LAT. *Fici*, *Caricæ*.) are a considerable article in the *materia medica*, chiefly employed in emollient cataplasms, and pectoral decoctions. The best are those which come from Turkey, packed in cases. Many are brought to us from Faro, of a small and inferior kind, also from the south of France. Vast quantities of figs of inferior quality are imported into Great Britain from Spain and Portugal. These are always sent to us packed in mats, and are such as the generality of grocers deal in. Figs are moderately nutrimental, grateful to the stomach, and easier to digest than any other of the sweet fruits.

FIGURES, in arithmetic, are characters denoting numbers. The figures most commonly used are the English figures, such as 1, 2, 3, 4, &c. and the Roman figures, such as I, II, III, IV, &c. In law, figures are not allowed to express numbers in indictments, &c. but numbers must be expressed in words. Roman figures are good in pleading, but English figures are not.

FILE, (*Fîles*. GER. *Feilen*. DU. *Vylen*. DA. *Fîle*. SW. *Filar*. FR. *Lîmes*. IT. *Lîme*. SP. & PORT. *Limas*. RUS. *Pili*. POL. *Pilki*.) among mechanics, a tool used in metal, &c. in order to smooth, polish, or cut. This instrument is of iron or forged steel, cut in little furrows, with chisels and a mallet, in a certain direction, and of a certain depth, according to the grain or touch required. After cutting the file, it must be tempered with a composition of chimney-soot, very hard and dry, diluted, and wrought up with urine, vinegar, and salt; the whole being reduced to the consistence of mustard. Tempering the files consists in rubbing them over with this composition, and covering them with loam; after which they are put into a charcoal-fire, and taken out by the time they have acquired a cherry-colour, which is known by a small rod of the same steel put in along with them. Being taken out of the fire, they are thrown into cold spring water, and when cold they are cleaned with charcoal and a rag, and being clean and dry, are kept from rust by laying them up in wheat-bran. Iron files require more heating than steel ones. Files are of different forms, sizes, cuts, and degrees of fineness, according to the different uses and occasions, for which they are made. Those in common use are the square, flat, triangular,

half-round, round, thin file, &c. each of which may be of different sizes, as well as different cuts. There are several machines invented for cutting files: they are worked by water as ready as by hand: they are adapted to cut all sorts of files, or any number at a time.

File likewise signifies a string or wire on which letters received, accounts paid or pending, invoices, bills of lading, &c. &c. are placed or filed, for the purpose of being kept in such order that they may at any time be referred to with facility.

FILE-CUTTER. The *file-cutter* forges the iron, forms the roughness of the *file*, by filing it, and makes *rasps*, by punching up the iron in sharp scales; after which he case-hardens them.

FILIGREE, (GER. *Filigranarbeit*, *Kornfaden*. DU. *Filigreïn*. DA. *Filigramsarbeide*. SW. *Filigramsarbete*. FR. *Filigrane*. IT. *Filigrana*. SP. & PORT. *Filigrana*.) a sort of ornamental work, composed of stiff paper and pasteboard of various colours, decorated with gilding, &c. and employed in the embellishment of ladies' work-baskets, tea-caddies, &c. whereon it is laid in the form of flowers, shells, and the like. The nuns in foreign countries, such as Spain, and Italy, make a variety of articles in filigree-work, which exhibit peculiar taste and elegance. It is also used for expressing a delicate kind of work in threads, on gold or silver plate, being derived from the Latin word *filum*, which signifies *thread*. The French are celebrated for this work.

FILTER, or **FILTRE**, a strainer commonly made of bibulous or filtering paper in the form of a funnel, through which any fluid is passed, in order to separate the gross particles from it, and render it limpid.

FILTERING-PAPER, is paper manufactured without size. To use it as such, the paper is shaped into the form of a cone, and placed in a funnel, in order to support it; otherwise it would break.

FILTERING-STONES, **BASINS**, &c. are either natural, or artificial, for the purpose of purifying water. Natural filters are found in rocks, mountains, beds of sand, gravel, &c. Artificial filtering-basins consist of equal parts of pipe-clay, and coarse sand. They should be three quarters of an inch thick.

FINDER, a person who finds any property. It was long insisted on, that such property having no rightful owner belonged to the king, by his prerogative. Even Blackstone fell into this error. But it is now generally admitted, that the finder of any treasure, *upon the earth*, has a title to it against all the world, but the rightful owner, who has lost, but not abandoned, it; and if he hath abandoned it, then it is the absolute property of the finder. See *Christian on Game Laws*, p. 25.

If any bank-bills, tickets, &c. which have

been stolen, or lost, are paid to, or delivered to, another without consideration, an action may be brought against the person in whose hands the same may be found.

If a bill payable to A, or bearer, be found by B, who gives it to C for a valuable consideration, an action of trover to recover the value of the bill may be brought against B, but not against C.

The property of goods found or stolen, may, nevertheless, be changed, by sale, for a valuable consideration, without notice, and in market overt; and the party purchasing such articles obtains a good title against the original owner: but if the party to whom the articles were transferred, even for a valuable consideration, had notice that the articles offered were lost, or stolen, the original proprietor may bring an action against the vendee, to recover them.

FINERS, or REFINERS, of gold and silver, are those who separate these metals from their ores, or the sweepings of gold and silver-smiths' workshops, &c.

FINERY, in the iron-works, one of the forges at which the iron is hammered and fashioned into, what they call, a bloom, or square bar.

FIRE. For the several regulations of building dwelling-houses, &c. so as to guard against fire, see stat. 4 Geo. 3. c. 2. s. 54. 6 Geo. 3. amending the former act.

FIRE-ARMS make no inconsiderable article of external, as well as internal, traffic; it became therefore a proper subject of legislative interference, to prevent imposition in the manufacture of them. Accordingly, by 55 Geo. 3. c. 115. proof-houses are directed to be established at Birmingham and elsewhere, for the proving of all barrels of fire-arms; and a penalty on all persons *using, or selling,* barrels not duly proved at the same, or one of them, were imposed. This statute, however, being soon found inadequate to the purposes in contemplation, from the loose words in which some of its provisions were expressed, was partially repealed; the offences intended to be prohibited, and the penalties to be exacted, more precisely defined; and all its provisions considerably extended, by 55 Geo. 3. c. 59; which latter act imposes a fine of 20*l.* on any person *using,* in any of the progressive stages of manufacture, any barrel not duly proved; on any person *delivering* the same, except through a proof-house; and on any person *receiving,* for the purpose of making guns, &c. any barrels which have not passed through a proof-house. These penalties to be levied on conviction before two justices; with like penalties, to be similarly levied, on persons counterfeiting the *proof-marks.*

FIRE-INSURANCE. See **INSURANCE**, and title **EUROPE**, article **LONDON**

FIRE-SHIPS, in the navy, are vessels charged with combustible materials; which,

having the wind of an enemy's ship, grapple her, and set her on fire.

FIRELOCKS, so called from their producing fire by the action of the flint and steel, are the arms carried by a foot-soldier. They were formerly three feet eight inches in the barrel, and weighing fourteen pounds; at present the length of the barrel is from three feet three inches, to three feet six inches, and the weight of the piece only twelve pounds. They carry a leaden bullet, of which twenty-nine make two pounds; its diameter is 550 of an inch, and that of the barrel 1-50th part of the shot. Firelocks were first made use of in 1690, when matchlocks were universally disused; but when invented is not ascertained. A firelock is called, by writers of about the middle of the last century, *asnaphaan*, which being a Low-Dutch word, seems to indicate its being a Dutch invention. Firelocks are principally manufactured at Birmingham and Sheffield.

FIRESTONE. The firestone, or pyrites, is a mineral composed of vitriol, sulphur, and an unmetallic earth, but in very different proportions in the several masses. It has its name of pyrites or firestone from its giving fire on being struck against a steel much more freely than flint will do. See **PYRITES.**

FIRE-WORKS. By 9 & 10 W. 3. all sorts of fire-works are declared to be a common nuisance; and the *making, causing to be made, giving, selling, or offering to sale,* any squibs, rockets, serpents, or other *fire-works,* or any cases, or implements for making the same, is made subject to a penalty of 5*l.* to be recovered on conviction before a justice of the peace. Casting or firing any such fire-works, or permitting the same to be cast or fired, *from any house, or place, and casting or firing the same into any house, shop, street, highway, or river,* is subjected to a penalty of 20*s.* to be recovered in like manner; and if not immediately paid, to an imprisonment and hard labour for not exceeding a month.

FIRKIN, an English measure of capacity, being the fourth part of the barrel: it contains eight gallons of ale, soap, or herrings; and nine gallons of beer.

FIRLOT, a dry measure used in Scotland. The oat-firLOT contains 21½ pints of that country; the wheat-firLOT contains about 1211 cubic inches; and the barley-firLOT 31 standard pints. Hence it appears that the Scotch wheat-firLOT exceeds the English bushel by 53 cubic inches.

FISH. (GER. *Fische.* DU. *Visschen.* DA. and Sw. *Fisk.* FR. *Poissons.* IT. *Pesci.* SP. *Pescados.* PORT. *Peixes.* RUS. *Rüba.* POL. *Rybi.* LAT. *Pisces.*) Fish are to be considered here under two different views; 1st, as private property; 2dly, as a national concern, and a subject of commerce. As private property, fish are protected by a pro-

digious number of statutes, some general in their operation, some local. The latter will be sparingly alluded to, the former are principally the following.

Trespassers in private ponds are subjected to three years' imprisonment, beside recompence to the party injured, by 3 Edw. 1. c. 20. Breaking and destroying the heads or dams of ponds, with intent to take the fish therein, are to pay treble damages on conviction, and be imprisoned three months, and find sureties for seven years, by 5 Eliz. c. 21.

Persons taking fish, or attempting so to do, out of *private waters*, without the consent of owner, are to pay a recompence to the owner not exceeding treble damages, 10s. to the overseers of the poor of the parish where offence committed, and be committed to the house of correction for one month. 22 & 25 Car. 2. c. 25.

And by the same, all the engines, nets, &c. may be destroyed.

The 4 & 5 W. 3. c. 23. authorizes the searching for all sorts of engines and nets for the destruction of fish in the houses, outhouses, &c. of all idle, disorderly, and mean persons, and none shall be allowed to keep the same but the owners or occupiers of rivers and fisheries, the makers and sellers of nets and engines, and fishermen and their apprentices.

The 9 Geo. 1. c. 22. commonly called the Black Act, makes it felony, *sans* clergy, to go armed and disguised and unlawfully steal any fish out of any river or pond; or maliciously to break down any head or mound of a pond, whereby the fish shall be lost or destroyed, or to rescue any person in custody for these offences.

Lastly comes the statute 5 Geo. 5. c. 14. which makes the taking, killing, or destroying, or attempting so to do, any fish, in any river or stream, pond, or pool, in any inclosed ground not being a park, paddock, garden, orchard, or yard, but private property, without the consent of the owner thereof, an offence punishable before one justice by a penalty of 5*l.* or commitment to the house of correction for not exceeding six months. And a similar offence committed in any like place in any park, paddock, garden, orchard, or yard, and convicted thereof at the assizes, subject to transportation for seven years. It likewise extends the same punishment to all persons aiding and assisting in the offence, and also to all persons purchasing the fish, knowing the same to have been so taken and stolen.

The foregoing statutes are universal in their application to all fish in private fisheries. For the constructions of them under particular circumstances, see *Dick. Pract. Expos.* v. 1. p. 521. & v. 3. p. 259.

The local statutes are principally the following.

By 13 Ric. 2. st. 1. c. 19. no person shall put in the waters of the Thames, Um-

ber, Ouse, Trent, nor other waters, any nets called stalkers, nor other engines, by which the fry or the breed of salmon, lampreys, or other fish, may be taken, upon the pain aforesaid.

And the waters of Lone, Wye, Mersey, Ribble, and all other waters in the county of Lancaster, shall be put in defence, as to the taking of salmon, from Michaelmas day to the Purification, and in no other time; and where such rivers be, there shall be assigned and sworn conservators of this statute as in the statute of Westminster; and they shall punish the offenders after the pain contained in the said statute. *Ibid.*

And by 1 Geo. 1. st. 2. c. 11. if any person shall lay or draw any nets, engines, other device, or do any other act in the Severn, Dee, Wye, Teame, Were, Tees, Ribble, Mersey, Dun, Air, Ouse, Swaile, Calder, Wharf, Eure, Derwent, and Trent, whereby the small fry of salmon, or any kepper or shedder salmon, or any salmon not eighteen inches long from the eye to the extent of the middle of the tail, shall be taken or killed; or shall set any bank, dam, hedge, or stank, or nets, cross the said rivers, whereby the salmon may be taken or hindered from going up the rivers to spawn; or shall, between the last of July and the 12th of November, (except in the Ribble, where they may be taken between January 1 and September 15, 23 Geo. 2. c. 26. § 7, 8, 9; and the rivers in the counties of Southampton and Wilts, where they may be taken between the 1st January and 12th September, 37 Geo. 3. c. 5.) by any net, device, &c. take or wilfully hurt any salmon in the said rivers, or shall at any time after the 12th November, fish there for salmon with any net less than two inches and a half in the mesh, and shall be convicted thereof before one justice of peace for the county, either upon view, by confession, or by one witness, he shall forfeit 5*l.* for every offence, besides the fish and the nets, &c. one moiety of the said sum to the informer, the other to the poor of the parish, to be levied by distress and sale of goods, by warrant of the justice; and for want of distress, the offender shall be committed to the house of correction, or the county gaol, for not more than three months, nor less than one, there to be kept to hard labour, and suffer such other corporal punishment as the justice shall think fit; and the justice shall order such nets, &c. to be seized and cut in pieces, or destroyed in his presence; and shall cause such banks, &c. made across the river, to be removed at the charges of the offender; such charges, if not paid on conviction, to be levied in the same manner as the said sum of 5*l.* § 14.

No salmon shall be sent to London from any such rivers that shall weigh less than six pounds each fish; and every person buying, selling, or sending a salmon of less weight,

who shall be convicted thereof as aforesaid, shall forfeit 5*l.* besides the fish; one moiety to the informer, the other to the poor of the parish; the said sum, if not paid on conviction; to be levied by distress and sale of goods, by warrant of the justice; and for want of distress, to be sent to the house of correction or county gaol, to be kept to hard labour for three months, unless the forfeiture be paid in the mean time.

Besides the before-mentioned fisheries, the salmon-fishery in the river Tweed is protected by a recent act, viz. 57 G. 3. c. 8.

By 45 Geo. 3. c. 33. the rivers Teign, Dart, and Plym, are still further protected, so far as regards the spawn or fry of fish, by prohibitions against taking them during particular months, and on Sundays.

And by 45 Geo. 3. c. 33. like provisions are made to protect the rivers in the county of Caermarthen.

The rivers Thames and Medway are placed, as to the preservation of their fish and spawn of fish, under the protection of the lord mayor of London, by 17 Ric. 2. c. 9.

Fish receive further protection generally from the following provisions of two statutes before mentioned.

By 1 Geo. 1. st. 2. c. 18. if any person bring to shore in England, sell, or expose to sale, or exchange for goods, unsizeable fish, not of the lengths following, from the eyes to the extent of the tail, bret or turbot, sixteen inches;—brill or pearl, fourteen inches;—codlin, twelve inches;—whiting, six inches;—bass and mullet, twelve inches;—sole, plaice, or dab, eight inches;—and flounder, seven inches; he shall forfeit the fish to the poor of the parish, and 20*s.*; one moiety to the informer, and the other to the poor; and in default of payment or distress, to be sent to the house of correction or other common gaol of the county, to be severely whipped and kept to hard labour six days, and not longer than fourteen.

But by 33 Geo. 2. c. 27. bret or turbot, brill or pearl, although under the said dimensions, may be exposed to sale, so as the same be not sold by retail for above 6*d.* a pound; and if any person ask or take for the same any higher price than at the rate of 6*d.* the pound, or refuse or neglect to weigh and measure any such fish exposed to sale when required, every such fish shall be forfeited; and any person may seize and deliver the same into the hands of a constable, and charge such constable with the party who asked or took any higher price: and such constable is to carry the person so charged, and also the fish seized and delivered to him, with all convenient speed before some justice of peace, within whose jurisdiction any higher price than as aforesaid was asked or taken; and if the person charged with such offence be convicted, either on confession or by the oath of one witness, he shall forfeit 20*s.* for every such offence, and the fish so

seized shall by order of such justice be given to the prosecutor, and the money shall be returned to the party who paid the same. § 11.

And no person shall take or destroy, or knowingly have in his possession, either on the water or on shore, or bring to shore, or cry, carry about, or expose to sale, or exchange for any goods, any spawn, fry, or brood of fish, or any unsizeable fish, or any fish out of season, or any smelt which shall not be full five inches in length from the nose to the utmost extent of the tail: and if any offend, any person may seize all such spawn or unsizeable fish, &c. wherever found, with all baskets and package in which found, and charge a constable or other peace officer with such offender; and after seizure the same shall be delivered to some constable or peace officer, who is to carry such offender and such spawn or fish, with the baskets, &c. before some justice; and on conviction, such offender shall forfeit all such spawn, fry, or brood of fish, unsizeable fish, and fish out of season, and every smelt of less size than five inches so seized, with all baskets or package in which seized; and all such spawn or unsizeable fish, &c. with the package, shall, by order of the justice, be delivered to the person who seized the same; and every offender convicted shall besides forfeit for every such offence 20*s.*

Lastly, 58 Geo. 3. c. 43. was enacted to prevent the destruction of the breed of salmon and fish of the salmon kind, in all the rivers of England, to which, therefore, by this statute, the provisions of former local statutes, with some additional ones, were extended.

FISHERMEN. There shall be a master, wardens, and assistants of the Fishmongers' company in London chosen yearly, at the next court of the lord mayor and aldermen after the 10th of June, who are constituted a court of assistants; and they shall meet once a month at their common hall to regulate abuses in fishery, register the names of fishermen, mark their boats, &c.

FISHERY, a place where great numbers of fish are caught. The principal fisheries for salmon, herring, mackarel, pilchards, &c. are along the coasts of England, Scotland, and Ireland; for cod, on the banks of Newfoundland; for whales, about Greenland; and for pearls, in the East and West Indies.

Fishery denotes also the commerce of fish, more particularly the catching them for sale. Were we to enter into a very minute consideration of the fisheries established in this kingdom, this article would swell beyond its proper bounds: since fisheries, however, if successful, are not only objects of commercial importance, but also contribute materially to our naval strength, by becoming permanent nurseries for seamen, we shall take notice of some of the most considerable of the British fisheries, and the institutions set on foot for their support. The

situation of the British coasts is the most advantageous in the world for catching fish: the Scottish islands, particularly those to the north, and west, lie most commodious for carrying on the fishing-trade to perfection. Of these advantages the Scots seem indeed to have been abundantly sensible; for their commerce in herrings is even noticed in history so early as the ninth century. The frequent laws which were enacted in the reigns of James III. IV. and V. discover a zeal for the benefit of the country, and the full restoration of these fisheries, which the Dutch had found means to engross. The Scottish fisheries were, however, more particularly indebted to the zealous encouragement of James V. and VI. and the same plan was resumed by Charles I.; but all this was frustrated by the breaking out of the civil wars. In 1661, Charles II. and other persons resumed the business of the fisheries with greater vigour. For this purpose the most salutary laws were enacted by the parliaments of England and Scotland; in virtue of which, all materials used in, or depending upon the fisheries, were exempted from all duties, excise, or imposts whatever. In 1677, a new royal company was established. Besides all the privileges which former companies had enjoyed, the king granted this new company a perpetuity, with power to purchase lands; and also 20*l.* to be paid them annually out of the customs of the port of London, for every dogger or buss they should build, and send out, for seven years to come. Most of the busses had been built in Holland, and manned with Dutchmen; on which pretence the French, who were then at war with Holland, seized six out of seven vessels, with their cargoes and fishing-tackle: and the company being now in debt, sold, in 1680, the remaining stores, &c. A number of gentlemen and merchants raised a new subscription of 60,000*l.* under the privileges and immunities of the former charter. This attempt also came to nothing. Soon after the Revolution, this business was again resumed upon a more extensive scale; the proposed capital being 300,000*l.* of which 100,000*l.* was to have been raised by the surviving patentees or their successors, and 200,000*l.* by new subscribers; but it did not succeed. In 1749, the house of commons appointed a committee to inquire into the state of the herring and white fisheries, and to consider the most probable means of extending the same. A subscription of 500,000*l.* was immediately filled in the city, by a body of men who were incorporated for twenty-one years, by the name of "*The Society of the Free British Fishery.*" Every encouragement was held out by government, both to the society, and to individuals, who might embark in this national business. A bounty of 30*s.* per ton, was to be paid annually out of the customs for fourteen years, to the

owners of all decked vessels or busses, from twenty to eighty tons burden, which should be built after the commencement of the act, for the use of, and fitted out and employed in, the said fisheries, whether by the society or any other persons. The Dutch, however, who were perfect masters of the arts of fishing and curing, and also in full possession of the European markets, maintained their ground against this formidable company. In 1786, the public attention was again called to the state of the British fisheries. In the house of commons a committee inquired into this great source of national wealth. It appeared that the best way of improving the fisheries was, to encourage the inhabitants living nearest the seat of them to become fishers; and it being found that the north-western coast of the kingdom, though abounding with fish and fine harbours, were utterly destitute of towns, an act was passed for incorporating certain persons therein named, by the style of "*The British Society for extending of the Fisheries, and improving the Sea-coasts of this Kingdom;*" and to enable them to subscribe a joint stock, and therewith to purchase lands, and build thereon free towns, villages, and fishing stations in the highlands and islands in that part of Great Britain called Scotland, and for other purposes.

Anchovy Fishery.—The anchovy is caught in the months of May, June, and July, on the coasts of Catalonia, Provence, &c. at which season it constantly repairs up the straits of Gibraltar into the Mediterranean. Collins says they are also found in plenty on the western coasts of England and Wales. The fishing for them is chiefly in the night-time; when a light being put upon the stern of their little fishing-vessels, the anchovies flock round and are caught in the nets. But then it is asserted to have been found by experience, that the anchovies taken thus by fire are neither so good, so firm, nor so proper for keeping, as those which are taken without fire. When the fishery is over, they they cut off the heads, take out their gall and guts, and then lay them in barrels, and salt them with *bay salt*. Being put on the fire, they dissolve almost in any liquor: or they are made into sauce by mincing them with pepper, &c. Some also pickle anchovies in small delft or earthen pots, made on purpose, of two or three pounds weight, more or less, which they cover with plaister to keep them the better. No other fish has the flavour of the anchovy, which should be chosen small, fresh pickled, white on the outside and red within, and mellow; the bones moist and oily; the flesh should be highly flavoured, the liquor reddish, and have a fine smell. If genuine, they have round backs; for those which are flat or large are sardines, sprats, and other small fish, which are preserved in imitation of

them; but which are easily distinguished, not only by the shape of the whole fish, but by the construction of the back-bone, which in an anchovy is triangular, in the sprat and other small fish cured in imitation of them, flat.

Cod Fishery. — There are two kinds of cod-fish; the one green or white, the other dried or cured; though they are the same fish differently prepared: the former being sometimes salted and barrelled, then taken out for use; and the latter having lain for a competent time in salt, and then dried in the sun or smoke. The chief fisheries for green cod are in the bay of Canada, on the great bank of Newfoundland, on the isle of St. Peter, and the isle of Sable; to which places vessels resort from many parts of Europe and America. They are from 100 to 150 tons burden, and will catch from 30,000 to 40,000 cod each. The most essential part of the fishery is, to have a master who knows how to cut up the cod, is skilled to take off the head properly, and above all a good salter, on which the preserving of them, and consequently the success of the voyage, depend. The best season is from the beginning of February to the end of April; the fish, which in the winter retire to the deepest water, coming then on the banks, and fattening extremely. What are caught from March to June keep well; but those taken in July, August, and September, when it is warm on the banks, are apt to spoil soon. Each fisher takes but one at a time, yet the most expert will take from 350 to 400 in a day; but that is the most, the weight of the fish, and the great coldness on the bank, fatiguing very much. As soon as they are caught, the heads are taken off; they are opened, gutted, and salted; and the salters store them in the bottom of the hold, head to tail, in beds a fathom or two square; putting layers of salt and fish alternately, but never mixing fish caught on different days. When they have lain thus for three or four days to drain off the water, they are placed in another part of the ship, and salted again; where they remain till the vessel is loaded.

The principal fishery for dry cod, is from Cape Rose to the Bay des Exports, along the coast of Placentia, in which compass there are several commodious ports for the fish to be dried in. These, though of the same kind with the fresh cod, are much smaller, and therefore fitter to keep, as the salt penetrates more easily into them. The fishery of both is much alike; only the latter is most expensive, as it takes up more time, and employs more hands, and yet scarcely half so much salt is spent in this as in the other. The bait is herring, of which great quantities are taken on the coast of Placentia.

The right, and manner, of fishing, are regulated by statute as follows: — By 2 & 3 Ed. 6. c. 6. the Admiralty shall not exact

any fees from fishermen from the voyage to Iceland, Newfoundland, or elsewhere, on pain of treble damages.

By 15 Car. 2. c. 7. no vessel shall go on a fishing voyage for Iceland and Westmona until the 10th of March, on forfeiture of the ship.

By 15 Car. 2. c. 16. no toll shall be levied in Newfoundland for any fish of English catching, nor any net cast near any harbour in Newfoundland to take the spawn of poor John, or the like, except for taking of bait only, on forfeiture.

None shall destroy any house, or stage, or utensils of fishing, in Newfoundland or Greenland, on pain of double the value. *Ibid.*

By 10 & 11 Will. 3. c. 25. all the king's subjects shall have free trade to Newfoundland, and no alien shall bait or fish there; none shall throw any annoyance into harbours, or destroy any stage there.

The first fishing ship, entering the harbour in the fishing season, shall be admiral for that time, the second vice-admiral, and so on, and shall see the rules in this act executed. *Ibid.*

Persons possessed of several places shall make their election which to abide in, and give their resolution to any after-comer, in forty-eight hours after demand, and, in case of difference, admirals shall proportion the place. *Ibid.*

No fisherman, or inhabitant of Newfoundland, shall possess any stage until all fishing ships be provided, except they have built them themselves. *Ibid.*

By-boat-keepers shall not meddle with house or stage belonging to any fishing ships: they shall carry two fresh men in six, and the inhabitants shall employ them; the master of a fishing ship shall carry one fresh man in five, and make oath thereof, and have every fifth man a green man. *Ibid.*

Marks of boats or train vats shall not be obliterated without the owner's consent: standing trees shall not be rinded, nor woods fired, necessary fuel excepted; sayns shall not be annoyed, nor nets, baits, or the like stolen. *Ibid.*

Admirals shall keep a journal, and deliver a copy thereof to the privy-council. They shall determine differences between the fishers and inhabitants, with power to appeal to the king's officers. *Ibid.*

By 26 Geo. 3. c. 26. certain bounties were granted to ships employed in the Newfoundland fishery, which have been continued, modified, and regulated by divers subsequent statutes. See 1 Geo. 4. c. 103.

By 41 Geo. 3. c. 77. salted salmon or cod-fish may be imported from Newfoundland or the coast of Labrador by British subjects, and shall on certain conditions be allowed a bounty of 3s. per quintal or cwt.; and such fish may be exported without repayment of the bounty. See *App. BOUNTIES.*

As fast as the masters arrive, they unrig all

their vessels, leaving nothing but the shrouds to sustain the masts; and in the meantime they provide a tent on shore, covered with branches of trees, with sails over them, with a scaffold of great trunks of pines, 12, 15, 16, and often 20 feet high, commonly from 40 to 60 feet long, and about one-third as much in breadth. While the scaffold is preparing, the crew are fishing; and as fast as they catch, they bring their fish ashore, and open and salt them upon moveable benches; but the main salting is performed on the scaffold.

When the fish have taken salt, they wash and hang them to drain on rails; when drained, they are laid on a sort of stages, which are small pieces of wood laid across, and covered with branches of trees, having the leaves stripped off for the passage of the air. On these stages they are disposed, a fish thick, head against tail, with the back uppermost, and are turned carefully every twenty-four hours. When they begin to dry, they are laid in heaps ten or twelve thick, in order to retain their warmth; and every day the heaps are enlarged, till they become double their first bulk; then two heaps are joined together, which they turn every day as before: lastly, they are salted again, beginning with those first salted; and being laid in huge piles, they remain in that situation till they are carried on board the ships, where they are laid on the branches of trees disposed for that purpose, upon the ballast, and round the ship, with mats to prevent their contracting any moisture. The cod supplies four kinds of commodities, viz. the sounds, the tongues, the roes, and the oil, which is extracted from the liver. The first are salted at the fishery, together with the fish, and put in barrels of from 600 to 700 pounds. The tongues are cured in like manner, and brought in barrels of from 400 to 500 pounds. The roes are also salted in barrels, and serve to cast into the sea to draw fish together, and particularly pilchards. The oil comes in barrels of from 400 to 520 pounds; it is called cod-oil, and is used in dressing leather. Divers statutes have been passed on the subject of it. See 48 Geo. 3. c. 20. and title *ante* NEW-FOUNDLAND. In Scotland, they catch a small kind of cod on the coasts of Buchan, and all along the Murray Frith on both sides; as also in the Frith of Forth, Clyde, &c. which is much esteemed. They salt and dry them in the sun upon rocks, and sometimes in the chimneys; indeed there are few places now on the north, and north-east, coasts of the kingdom where cod is not preserved in considerable quantities, from Bridlington, and Filey, bays on the Yorkshire coast, to Berwick.

Herring Fishery.—Our great stations for this fishery are off the Shetland and Western Isles, the coast of Norfolk, and the Isle of Man. There are two seasons for herring-

fishing; the first from June to the end of August; and the second in autumn, when the fogs become very favourable for this kind of fishing. In the late king's reign, many vigorous efforts were made, and bounties allowed, for the encouragement of the British herring-fisheries: the first was at 30s. per ton, to every buss of 70 tons and upwards. This bounty was afterwards raised to 50s. per ton, to be paid to such adventurers as were entitled to it by claiming it at the place of rendezvous. The busses are from 20 to 90 tons burden, but the best size is 80 tons. The bounties now payable are by 55 Geo. 3. c. 94. on every buss of certain tonnage, &c. 3l. per ton; and on every barrel of 32 gallons cured and landed, 4s. A vessel of 80 tons ought to take 10 lasts, or 120 barrels of herrings to clear expenses, the price of the fish to be a guinea a barrel. A ship of this size ought to have 18 men, and three boats; one of 20 tons should have six men; and every five tons above require an additional hand. To every ton are 250 yards of net; so a vessel of 80 tons carries 20,000 square yards; each net is twelve yards long, and ten deep; and every boat takes out from 20 to 30 nets, and puts them together, so as to form a long train; they are sunk at each end of the train by a stone, which weighs it down to the full extent: the top is supported by buoys made of sheep-skins, with a hollow stick at the mouth, fastened tight; through this the skin is blown up, and then stopped with a peg, to prevent the escape of the air. Sometimes these buoys are placed at the top of the nets; at other times the nets are suffered to sink deeper, by lengthening the cords fastened to them, every cord being, for that purpose, ten or twelve fathoms long; but the fisheries are generally in more shallow water.

Of the Scots' fishery in the Western Isles, the following account is given by Mr. Pennant: "The fishing is always performed in the night, unless by accident. The busses remain at anchor, and send out their boats a little before sun-set; which continue out, in winter and summer, till day-light; often taking up and emptying their nets, which they do ten or twelve times a night, in case of good success. During winter it is a most dangerous and fatiguing employ, by reason of the greatness and frequency of the gales in these seas, and in such gales are the most successful captures; but by the providence of Heaven, the fishers are seldom lost, and what is wonderful, few are visited with illness. They go out well prepared, with a warm great-coat, boots, and skin aprons, and a good provision of beef and spirits. The same good fortune attends the busses, which in the tempestuous season, and in the darkest nights, are continually shifting in these narrow seas from harbour to harbour. Sometimes 80 barrels of herrings are taken

in a night by the boats of a single vessel." To this may be added another account, published 1818, by Laing: "These seas (about the Shetland Islands) abound with cod, turbot, haddock, ling, lobsters, crabs, oysters, &c. and, at certain seasons, vast shoals of herrings. In June, they appear in surprising columns, and perform the circuit of these islands; after which they totally disappear. They are divided into columns of 5 or 6 miles long, and 3 or 4 broad; and in their passage, the water is propelled before them like an impetuous current. Vessels from many nations used to rendezvous in Bressay Sound. The Dutch especially carried on this fishery very extensively. They had 500 busses, under convoy of 4 ships of war; but a French fleet of 6, in 1703, engaged them, sunk the admiral's ship, and the rest fled. Their boats destroyed about 400 of the Dutch fishing vessels; and since then their fishery has declined. The fishing business here engrosses the whole attention of the men, who resort to it in light skiffs, which they get from Norway. Their export of fish to foreign markets, especially Spain and Italy, amounts to several hundred tons. So prevalent is this rage for fishing, that the only land used for husbandry is that along the sea-coast; which bears no proportion to that which lies waste and uncultivated." The herrings are preserved by salting, after the entrails are taken out. The last mentioned is an operation performed by the country people, and this employs both women and children; but the salting is only intrusted to the crew of the busses. The fish are laid on their backs in the barrels, and layers of salt between them. The entrails are not lost, for they are boiled into an oil; 8000 fish will yield ten gallons, valued at one shilling the gallon. A vessel of 80 tons takes out 244 barrels of salt: a drawback is allowed for each barrel used by the foreign, or Irish, exportation of the fish; but there is a duty per barrel for the home-consumption, and the same for those sent to Ireland. The barrels are made of oak-staves, chiefly from Virginia; the hoops are from several parts of our island, and are either of oak, birch, hazel, or willow; the last from Holland, liable to a duty. The barrels cost about 3s. each; they hold from 500 to 800 fish, according to the size of the fish; and are made to contain 32 gallons. The barrels are inspected by proper officers: a cooper examines if they are statutable and good; if faulty, he destroys them, and obliges the maker to stand to the loss. Herrings are cured either white (*i. e.* pickled), or red. Of the first, those done by the Dutch are the most esteemed, being distinguished into four sorts, according to their sizes; the best are those that are fat, fleshy, firm, and white, salted the same day they are taken with good salt, and well barrelled. The British-cured

herrings are little inferior, although not quite equal, to the Dutch; for in opposition to all their endeavours to conceal the secret, their method of curing, lasting, or casking the herrings, has been discovered, and is as follows: After they have hauled in their nets, which they drag in the stern of their vessel backwards and forwards in traversing the coast, they throw them upon the ship's deck, which is cleared of every thing for that purpose: the crew is separated into divisions, and each division has a peculiar task: one part opens and guts the herrings, leaving the melts and roes; another cures and salts them, by lining or rubbing their inside with salt; the next packs them, and between each row and division they sprinkle handfuls of salt; lastly, the cooper heads the casks very tight, and they are then stowed in the hold. Red-herrings must lie twenty-four hours in the brine, inasmuch as they are to take all their salt there; and when they are taken out, they are spited; that is, strung by the head on little wooden spits, and then hung in a chimney made for that purpose. After this process, a fire of brushwood, which yields much smoke, but no flame, being made under them, they remain there till sufficiently smoked and dried, and are afterwards barrelled up for keeping.

The white herring-fishery has been the subject of numerous legislative provisions, especially by the 48 G. 3. c. 110.; 51 G. 3. c. 101.; 52 G. 3. c. 153.; 54 G. 3. c. 102.; but lastly by 55 G. 3. c. 94. which repeals certain provisions of the anterior statutes, amends others, and renders the whole thus amended perpetual. This statute, which is too voluminous to be the subject of more than a reference here, regulates the burdens, and limits the bounties, of vessels employed in this trade; directs the size and structure of the barrels in which the fish shall be packed; the measure of the crans by which herrings shall be bought and sold; the description of nets by which they are to be caught; the mode by which disputes between the officers and the curers shall be settled; empowers the commissioners of excise to remit penalties and forfeitures; to alter regulations made by them, according to statute of 48 Geo. 3.; and directs that all penalties shall be recovered, levied, and mitigated, as under the laws of customs and excise. Several of the bounties granted by former acts of parliament to encourage this fishery, are repealed, and further regulations made concerning the fishery by stat. 1 & 2 Geo. 4. c. 79.

Lobster Fishery. — Lobsters are taken along the British Channel, in the neighbourhood of Arbroath in Scotland, and on the coast of Norway, whence they are brought to London for sale; and also in the Frith of Forth. By 10 & 11 W. 3. c. 24. no lobster is to be taken under eight inches in length, from the peak of the nose to the end of the middle fin of the tail; and by

9 Geo. 2. c. 33. no lobsters are to be taken on the coast of Scotland from the 1st of June to the 1st of September. The best lobsters, with which the London market is now supplied, come from Heligoland: they are of a deeper black, and have their flesh much more firm, than any others.

Mackarel Fishery.—The mackarel is a summer-fish of passage, found in large shoals, in different parts of the ocean, not far north; but especially on the French and English coasts. The fishing is usually in the months of April, May, June, and even July, according to the place. They enter the English Channel in April, and proceed up the Straits of Dover as the summer advances; so that by June they are on the coasts of Cornwall, Sussex, Normandy, Picardy, &c. where the fishery is most considerable. They are an excellent food fresh, and not to be despised when well prepared, pickled, and put up in barrels; a method of preserving them chiefly practised in Cornwall. The fish is taken either with a line, or nets; the latter mode is usually performed in the night-time. The rules observed in the fishing for mackarel are much the same as those already mentioned in the fishery of herrings. There are two ways of pickling them: the first is by opening and gutting them, and filling the belly with salt, crammed in as hard as possible with a stick; which done, they range them in strata, or rows, at the bottom of the vessel, strewing salt between the layers. In the second way, they put them immediately into tubs full of brine, made of fresh water and salt, and leave them to steep till they have imbibed salt enough to make them keep; after which they are taken out and barrelled up, care being used to press them close down. Mackarel are not cured, or exported, as merchandise, except a few by the Yarmouth and Lowestoffe merchants, but are generally consumed at home; especially in the city of London, and the sea-ports between the Thames and Yarmouth east, and the Land's-End of Cornwall west.

Oyster Fishery.—This fishery is principally carried on at Colchester in Essex; Faversham and Milton in Kent; the Isle of Wight; the Swales of the Medway; and Tenby on the coast of Wales. From Faversham and the adjacent parts the Dutch have sometimes loaded a hundred large hoys with oysters in a year. They are also taken in large quantities near Portsmouth, and in all the creeks and rivers between Southampton and Chichester; many of which are carried about by sea to London and to Colchester, to be fed in the pits about Wivenhoe and other places. There are some beds of them on the north-east coast of Lincolnshire, and others on the Brighton coast. Considerable quantities are also taken at Porto Bello, on the Frith of Forth, by which Edinburgh and places ad-

jacent are supplied in a most plentiful manner. In the road to Musselburgh, they have a very large oyster with a white shell, very much scalloped, called the Pandore oyster. In Edinburgh they preserve this fish some time by keeping them in sea-water, and throwing in a little meal, which is changed every other day.

The breed of oysters is protected by divers statutes. The 2 Geo. 2. c. 19. was made for regulating, well-ordering, and improving the oyster-fishery in the river Medway, under the authority of the mayor and citizens of Rochester.

By 31 Geo. 3. c. 51. persons unlawfully catching oysters or brood within the limits of any fishery, may be prosecuted at the sessions, and punished by fine and imprisonment: but the act is not to extend to the taking of floating fish. Sect. 1, 2.

Justices may issue warrants for apprehending offenders, and, for want of sureties, may commit them till the quarter-sessions. Sect. 3.

Persons found taking, or using engines for taking oysters or brood, refusing to discover themselves, may be seized. Sect. 4.

But no justice is to commit, or require a security from, any person, without a recognizance is entered into to prosecute. Sect. 5.

And persons may be discharged from confinement upon entering into a recognizance of 20*l*. Sect. 6.

This act is not to affect any act in force respecting any particular oyster-fishery, or to preclude a prosecution at the common law. Sect. 7, 8.

The 48 Geo. 3. c. 144. recites this previous statute of the 31st Geo. 3. and extends the punishment of felony to the offences described by it, viz. transportation for seven years, or imprisonment not exceeding three years. Taking the *fry* or *spat* of oysters by a *dredge* with the intent to remove them for further growth in another place, is not such a taking as is prohibited by the 3d Jac. 1. c. 12. *Bridges v. Richardson*, E. T. 54 G. 3.

Pilchard Fishery.—The chief pilchard-fisheries are along the coasts of Dalmatia, Brittany, Cornwall, and Devonshire. That of Dalmatia is very plentiful: that of Brittany employs annually about 300 ships. That on the coast of Cornwall employs a great number of men on the sea, training them to naval affairs; as well as women and children at land, in salting, pressing, washing, and cleaning; in making boats, nets, ropes, casks, and all the trades depending on their construction and sale. The poor are fed with the offals of the captures, the land with the refuse of the fish and salt. Ships are often freighted hither with salt, and into foreign countries with the fish, carrying off at the same time part of our tin. Every hogshhead, together

with the bounty allowed for each exported, and the oil made out of each, amounts, one year with another, at an average, to the price of 1*l.* 13*s.* 5*d.*

The numbers that are taken, at one shooting out of the nets, are amazingly great. The season is from June to September. On the coasts of France they make use of the roes of the cod-fish as a bait; which, thrown into the sea, makes them rise from the bottom, and run into the nets. On our coasts there are persons posted ashore, who, spying the colour of the water where the shoals are, make signs to the boats to go among them to cast their nets. When taken, they are brought on shore to a warehouse, where they are laid upon broad piles, supported with backs and sides; and as they are piled, they salt them with *bay-salt*; in which lying to soak for 30 or 40 days, they run out much blood, with dirty pickle and bitter: then they wash them clean in sea-water; and when dry, barrel, and press them hard down, to squeeze out the oil, which issues out at a hole in the bottom of the cask.

Salmon Fishery.—The chief salmon-fisheries in Europe are in England, Scotland, and Ireland, in the rivers, and on the sea-coasts adjoining to the rivers' mouths. The rivers most distinguished for salmon in Scotland are, the Tweed, the Clyde, the Tay, the Dee, the Don, the Spey, the Ness, the Bewley, &c. in most of which it is very common, about the height of summer, especially if the weather happens to be very hot, to catch four or five score of salmon at a draught. The chief rivers in England for salmon are the Tyne, the Trent, the Severn, and the Thames. The fishing is performed with nets, and sometimes with locks or weirs made on purpose, which in certain places have iron or wooden grates so disposed, in an angle, that being impelled by any force in a contrary direction to the course of the river, they may give way, and open a little at the point of contact, and immediately shut again, closing the angle. The salmon, therefore, coming up into the rivers, are admitted into these grates, which open, and suffer them to pass through, but shut again and prevent their return. The salmon is also caught with a spear, which they dart into him when they see him swimming near the surface of the water. It is customary likewise to catch them with a candle and lanthorn, or wisp of straw set on fire; for the fish, naturally following the light, are struck with the spear, or taken in a net spread for that purpose, and lifted with a sudden jerk from the bottom.

The capture of salmon in the Tweed, about the month of July, is prodigious. In a good fishery, often a boat-load, and sometimes near two, are taken in a tide. The coopers in Berwick immediately begin to salt the salmon thoroughly in pipes and

other large vessels, and afterwards barrel them to send abroad, or to the London markets.

Most of the salmon taken before April, or to the setting in of the warm weather, is sent fresh to London in baskets; unless now and then the vessel is disappointed by contrary winds of sailing immediately; in which case the fish is brought ashore again to the cooper's offices, and boiled, pickled, and kitted, and sent to the London markets by the same ship, and fresh salmon put in the baskets in lieu of the stale ones. Some fish are sent in this manner to London the latter end of September, when the weather grows cool; but then the fish are full of roes, grow very thin-bellied, and are not esteemed so palatable.

Scotland possesses great numbers of fine fisheries on both sides of that kingdom. The Scotch in early times had most severe laws against the killing of this fish; insomuch that the third offence was made capital, by a law of James IV. Before that, the offender had power to redeem his life. They were thought, in the time of Henry VI. a present worthy of a crowned head; for in that reign the Queen of Scotland sent to the Duchess of Clarence ten casks of salted salmon, which Henry directed to pass duty-free. The salmon are cured in the same manner as at Berwick, and a great quantity is sent to London in the spring; but after that time, the adventurers begin to barrel and export them to foreign countries; but that commerce is less than it was in former times.

Ireland, particularly the north, abounds with this fish; the most considerable fishery is at Cranna, on the river Ban, about a mile and a half from Coleraine. The mouth of this river faces the north; and is finely situated to receive the fish that roam along the coast in search of an inlet into fresh water, as they do all along that end of the kingdom which opposes itself to the northern ocean. In the Ban they fish with nets 18 score yards long, and are continually drawing night and day the whole season, which lasts about four months, two sets, of sixteen men each, alternately relieving one another. The best drawing is when the tide is coming in. A few miles higher up the river is a weir, where a considerable number of fish, that escape the nets, are taken. Large quantities are likewise taken in the Boyne, the Shannon, &c.

With regard to the manner of curing salmon; when the fish are taken, they are opened along the back, the guts and gills, and the greatest part of the bones removed, so as to make the inside as smooth as possible. They then salt the fish in large tubs made for the purpose, where they lie a considerable time soaking in brine; and about October, they are packed close up in barrels,

and sent to London, or up the Mediterranean. They have also in Scotland a great deal of salmon salted in the common way, which, after soaking in brine a competent time, is well pressed, and then dried in smoke; this is called kipper. It is chiefly made for home-consumption; and if properly cured and prepared, is reckoned very delicious fish. Wales is also famous for its salmon-fisheries, as well as for the curing of the fish. Large quantities are taken in the rivers of the principality, both south and north, and when cured, are preferred in London to those from the northern parts of the kingdom. After what has been premised respecting the protection of the breed of salmon, at the commencement of this title, it is not thought necessary to notice the subject further.

Sturgeon Fishery.—The greatest sturgeon fishery is in the mouth of the Volga, on the Caspian Sea; where the Muscovites employ a great number of hands, and catch them in a kind of inclosure, formed by huge stakes, representing the letter Z repeated several times. These fisheries are open on the side next the sea, and close on the other, by which means the fish ascending in its season up the river, is embarrassed in these narrow angular retreats, and is easily killed with a harpoon-iron. Sturgeons, when fresh, eat deliciously; and in order to make them keep, they are salted or pickled in large pieces, and put in kegs of from 30 to 50lbs. weight. But the great object of this fishery is the roe, of which the Muscovites are extremely fond, and of which is made the caviar, or kavia, so much esteemed by the Italians.

Tunny Fishery.—The tunny was a fish well known to the ancients, and made a great article of commerce: there are still very considerable tunny-fisheries on the coasts of Sicily, as well as in several other parts of the Mediterranean. The nets are spread over a large space of sea by means of cables fastened to anchors, and are divided into several compartments. The entrance is always directed, according to the season, towards that part of the sea from which the fish are known to come. A man placed upon the summit of a rock high above the water, gives the signal of the fish being arrived; for he can discern from that elevation what passes under the waters, much better than any person nearer the surface. As soon as notice is given that the shoal of fish has penetrated as far as the inner compartment, or the chamber of death, the passage is drawn close, and the slaughter begins. The undertakers of these fisheries pay an acknowledgment to the king, or the lord upon whose land they fix the main stay or foot of the tonnara; they make the best bargain they can; and till success has crowned their endeavours, obtain this leave for a small consideration; but the rent is afterwards raised in proportion to their capture.

The tunny enters the Mediterranean about the vernal equinox, travelling in a triangular phalanx, so as to cut the waters with its point, and to present an extensive base for the tides and currents to act against and impel forwards. These fish repair to the warm seas of Greece to spawn, steering their course thither along the European shores, but as they return, approach the African coast; the young fry is placed in the van of the squadron as they travel. They come back from the east in May, and abound on the coast of Sicily and Calabria about that time. In autumn they steer northward, and frequent the neighbourhood of Amalfi and Naples; but during the whole season stragglers are occasionally caught. When taken in May, the usual time of their appearance in the Calabrian bays, they are full of spawn, and their flesh is then esteemed unwholesome, the milts and roes particularly. To prevent these bad effects, the natives fry them in oil, and afterwards salt them. There are considerable quantities of this fish consumed annually in the two Sicilies. From the beginning of May to the end of October it is eaten fresh, and all the rest of the year salted. The most delicate part is the muzzel. The belly salted was called *tarentallum*, and accounted a great delicacy by the Romans; its present name is *surra*. The rest of the body is cut into slices, and put into tubs.

Turbot Fishery.—Turbot are taken chiefly off the north coast of England, and others off the Dutch coast; they grow to a large size, viz. from 25 to 50 pounds weight. The largest turbot (as well as several other kinds of flat fish) are taken by the hook and line, for they lie in deep water; the method of taking them in weirs, or staked nets, being very precarious. When the fishermen go out to sea, each person is provided with three lines, which are coiled on a flat oblong piece of wicker-work; the hooks being baited, and placed regularly in the centre of the coil. Each line is furnished with fourteen score of hooks, at the distance of six feet two inches from each other. The hooks are fastened to the lines upon sneads of twisted horse-hair, 27 inches in length. When fishing, there are always three men in each coble, and consequently nine of these lines are fastened together, and used as one line, extending in length near three miles, and furnished with 2520 hooks. An anchor, and a buoy, are fixed at the first end of the line, and one more at the end of each man's lines; in all four anchors, which are commonly perforated stones, and four buoys made of leather, or cork. The line is always laid across the current. The tides of flood, and ebb, continue an equal time upon our coast, and, when undisturbed by winds, run each way about six hours; they are so rapid that the fishermen can only shoot, and haul their lines, at the turn of the

tide, and therefore the lines always remain upon the ground about six hours. The same rapidity of the tides prevents them using hand-lines; therefore two of the people commonly wrap themselves in the sail, and sleep, while the other keeps a strict look-out, for fear of being run down by ships, and to observe the weather: for storms often rise so suddenly, that it is with extreme difficulty they can sometimes escape to the shore, leaving their lines behind. Besides the coble, the fishermen have also a five-men boat, which is 40 feet long, and 15 broad, and 25 tons burden. This boat is decked at each end, but open in the middle, and has two large lug-sails. All our able fishermen go in these boats to the herring-fishery at Yarmouth in the end of September, and return about the middle of November. The boats are then laid up till the beginning of Lent, at which time they go off in them to the edge of the Dogger, and other places, to fish for turbot, cod, ling, skate, &c. They always take two cobbles on board; and when they come upon their ground, anchor the boat, throw out the cobbles, and fish in the same manner as those do who go from the shore in a coble; with this difference only, that here each man is provided with double the quantity of lines, and instead of waiting the return of the tide in the coble, they return to their boat, and bait their other lines; thus hauling one set and shooting another at every turn of the tide. They most commonly run into harbour twice a week to deliver their fish. The best bait is fresh herring, cut in pieces of a proper size: the five-men boats are always furnished with nets for taking them. Next to herrings are the lesser lampreys. The next baits in esteem are small haddocks cut in pieces, sand-worms, and limpets, here called flidders; and when none of these can be had, they use bullock's liver. The hooks are two inches and a half long in the shank, and near an inch wide between the shank and the point. The line is made of small cording, as it is always tarred before it is used. Turbots are extremely delicate in their choice of baits. Turbot, sturgeon, lobsters, anchovies, stock-fish, and eels, are excepted out of the prohibitions enacted against foreigners importing fish into this kingdom, by 1 Geo. 1. c. 18. and 9 Geo. 2. c. 53.

Whale-Fishery.—The following abstract of the history and practice of the Greenland whale-fishery is taken from the work of an intelligent voyager, and published in the present year, J. Laing. The English began the whale-fishery immediately after its discovery by Barentz, a Dutchman, in 1596. They had formidable rivals in the Dutch, who in 46 years caught 32,900 whales, the oil and whalebone of which sold for about 15,800,000*l.* The season for beginning the voyage is April, as it is necessary to commence fishing in May. The manner of

fishing is to make fast to an iceberg (a mass of floating ice which is stationary), and then prepare the lines, &c. In every boat there is a line 720 fathoms long, to the end of which is fixed an harpoon, about eight feet five inches long; the iron part is better than two feet long, and is extremely sharp. On each side of the point is placed a barb, or wither, diverging from the harpoon at an angle of nearly 40 degrees, to prevent the instrument from finching and losing hold. There are several lances, or spears, about six feet long, the points of which are about two inches broad; by these the whales are killed, after being struck with the harpoon.

A boat's crew consists of a harpooner, a boat-steerer, a line-manager, and three or four men, more or less, according to the size of the boat. When a whale is seen from the ship, one or more boats are sent in pursuit, and if they get close to it, the harpooner strikes it with his harpoon; but should the boat not get near enough for this purpose, he heaves the harpoon at the whale with great skill. As soon as the animal finds itself wounded it descends, dragging the line fastened to the harpoon after it with such velocity, that one of the crew is instantly obliged to pour water on the stern of the boat to prevent its taking fire by the intense friction. A hatchet is always at hand to cut the line in the event of its getting entangled. A large whale will sometimes run out the lines of two boats (1500 fathom). As soon as a whale is struck, they hoist a flag, or jack, in the boat, which being seen in the ship, the crew call out "a fall, a fall," and all hands that can be spared go off in the boats, and repair to the place where it is expected the whale will rise to breathe. When it appears, they strike it again and again. When the whale becomes fatigued and is severely wounded, it throws up water mixed with blood, and immediately the boats surround it, and dispatch it with their spears. As soon as it is killed, it is towed by the boats to the ship, and being made fast by tackles placed at the nose and tail, is immediately stripped of its blubber. This process is called "*finching*," and is speedily performed. The harpooners and their assistants cut the blubber into long stripes, which are hoisted into the ship, cut into smaller pieces, and thrown into the hold, from whence they are again brought upon deck, to be pared and barrelled. The blubber being brought upon deck, the fleshy parts are pared off, and it is then placed, piece by piece, on a block, having three iron spikes on the top, to keep it steady. Here it is skinned by a harpooner, and then it is ready to be *chopped*. When it is chopped, it is let down to a tub in the *hold*, and from thence put, piece by piece, into the bung-holes of the casks, which are fixed for the purpose of receiving it previous to sailing from home.

Linnaeus says the common whale was

commonly 160 feet long; but in the seas of Spitzbergen, at this day, they seldom exceed 70 feet, which is, perhaps, because they are killed before they have arrived at their full growth. The head is of a triangular shape, and one-third of the whole fish. They have no teeth, but merely laminae in the upper jaw, like those in the bill of a duck, closely set together, and black. The tongue is from 18 to 20 feet long, consisting of a soft spongy fat, and frequently yielding five, or six, barrels of oil. The throat is not more than four inches wide. The body tapers gradually to the tail, which is often above 20 feet broad. The colour of the whale varies with its age, the back of some being black, of others black and white, and of some white. Their skin is smooth, lubricated, and about one inch thick. Their bodies immediately under the skin are covered with a layer of fat (the blubber) from 12 to 18 inches thick, according to the age and size of the fish. A large one will produce 12, 20, and even sometimes 25 tons of oil, the price of which varies from 30*l.* to 45*l.* per ton. The ordinary quantity of oil produced from whales of different sizes is generally proportioned to the sizes of the bones, in a ratio nearly approaching to the following:

Bone in feet.	Oil in tons.
2 - - -	3
4 - - -	4
6 - - -	5½
8 - - -	9
10 - - -	13
12 - - -	20

There occur exceptions to this rule of proportion, but they are not frequent, and generally in favour of the oil. Whalebone was formerly an article of great value in commerce, even of more consideration than the blubber, and sold for 600*l.* per ton. Its price, however, now, when compared with the other more valuable part, is an object of little attention to the whale fishers. By an

ancient flower of the royal prerogative, the tails of all the whales belong to the queen, as a perquisite to her majesty's wardrobe, but the claim to this privilege has ceased with the value of the article. The principal uses to which whalebones are now applied are spokes to wheels of light carriages of pleasure, fishing-rods, riding driving-whips, and walking-sticks.

The following statements bring under one view the comparative exertions of different countries, in the prosecution of the whale-fishery, for the last two centuries.

Dutch Whale Fishery.—This fishery was first carried on, to any extent at least, by a company, which sent thither annually a few ships, to the exclusion of the rest of their countrymen, and who also endeavoured to exclude foreigners. In the year 1613, the company's ships amounted to seven sail, who, on their arrival at Spitzbergen, found there fifteen Dutch, French, and Flemish ships, besides English interlopers. Next year, the Dutch sent eighteen sail, of which four were men-of-war. In 1615, the king of Denmark sent a squadron of three men-of-war to assert his exclusive right, but with such indifferent success, that his majesty thought fit to give up the point. In 1617, our company were more lucky than in any other year, and actually made one thousand nine hundred ton of oil. The Dutch made, for many years after, very indifferent voyages; and, as their great statesman M. De Witt well observes, had certainly been forced to relinquish the trade, had it not been laid open by the dissolution of their Greenland company, to which he attributes their having, in his time, beat the English, and almost all other nations, out of that trade, which they then carried on to a prodigious extent.

The following is a list of the ships sent from Holland to the Greenland, and Davis' Straits, whale-fishery, from the year 1661 to 1788, both inclusive, with an account of the number of whales caught each year:

1782					

N. B. From the year 1719 are included the Davis' Straits Ships.

From this period the Dutch whale-fishery rapidly declined, and was at length totally annihilated during the late war.

English Whale Fishery.—The English Whale Fishery, like that of Holland, was originally carried on by an exclusive company. The first association of merchants for this purpose was soon dissolved; but owing to successive grants of the same kind, the trade continued fettered for a considerable period posterior to the Revolution. During this time it was, as might have been expected, carried on with almost no success.—In 1724, the South Sea Company embarked largely in this department of industry; but having, in the course of eight years, incurred an immense loss, they were glad to abandon it. In 1755, the government being determined to encourage this fishery, a bounty of 20s. per ton was granted to all ships of 200 tons and upwards, employed therein; as this bounty, however, was found insufficient, in 1749 it was doubled. This extraordinary encouragement, by factitiously determining a portion of the national capital into this channel, had at last a considerable effect; but a long time elapsed ere the English could, even with these superior advantages, successfully compete with the Dutch. Since this epoch many alterations have been made in the laws respecting the Greenland fishery. The reader will find a full account of this fishery, and other useful information, in the work recently published by Captain Scoresby.

American Whale Fishery.—The whale fishery first attracted the attention of the Americans in 1690, and originated at the island of Nantucket, in boats from the shore. In 1715, six sloops, of thirty-eight tons burden each, were employed in this fishery, from that island. For many years their adventures were confined to the American coast, but as whales grew scarce here, they were extended to the Western Islands, and to the Brazils, and at length to the North, and South, Seas. For a long time, the Dutch seemed to monopolize the whale fishery, which they followed, with success, in the Greenland or Northern Seas.

As early as 1663, they had two hundred and two ships employed in this fishery, and in 1721, as many as two hundred and sixty; in 1788, the number was reduced to sixty-nine, and for many years past, not only has

this branch of their commerce, but almost every other, been completely annihilated. In 1731, the Americans had about thirteen hundred tons of shipping employed in this fishery along their coast. About the year 1750, the whale left the American coast. The hardy enterprise and activity of the American sailor, however, soon followed him in every part of the Northern, and Southern, Seas.

From 1771 to 1775, Massachusetts employed, annually, one hundred and eighty-three vessels, of thirteen thousand eight hundred and twenty tons, in the northern whale fishery, and one hundred and twenty one vessels, of fourteen thousand, and twenty-six tons, in the southern; navigated by four thousand and fifty-nine seamen. The peculiar mode of paying the seamen, in these hazardous voyages, has contributed not a little to the success of the voyages themselves. Each has a share in the profits of the voyage, and is dependent on his own exertions for the reward of his toils. Whether he shall be rich or poor, depends on his activity in managing the boat, in pursuit of the whale, and his dexterity in directing the harpoon. This has led to a spirit of enterprise and hardihood never surpassed, if ever equalled, by the seamen of any nation in the world.

During the war of the American revolution, this fishery was destroyed; on the return of peace, it recovered, by degrees; and from 1787 to 1789, ninety-one vessels, of five thousand eight hundred and twenty tons, were annually employed in the northern fishery, and thirty-one vessels, of four thousand three hundred and ninety tons, in the southern, with one thousand six hundred and eleven seamen. The quantity of spermaceti oil taken annually, from 1771 to 1775, was thirty-nine thousand three hundred and ninety barrels, and of whale oil eight thousand six hundred and fifty. From 1787 to 1789, the quantity of spermaceti taken annually was seven thousand nine hundred and eighty barrels, and whale oil thirteen thousand one hundred and thirty. In the representation made to Congress in the year 1790, by the legislature of Massachusetts, it is stated that, before the late war, about four thousand seamen, and twenty-four thousand tons of shipping, were annually employed from that state in the whale fishery, and that the produce thereof was about 350,000*l.* lawful money, or about 1,160,000 dollars. A great part of this fishery has been carried on from Nantucket, where it originated, a small island about fifteen miles in length, and two or three miles in breadth, situated about thirty miles from the coast. Before the revolutionary war, this small island had sixty-five ships, of four thousand eight hundred and seventy-five tons, annually employed in the northern,

and eighty-five ships, of ten thousand two hundred tons, in the southern fishery. From 1787 to 1789, it had only eighteen ships, of one thousand three hundred and fifty tons, in the northern, and eighteen ships, of two thousand seven hundred tons, in the southern fishery. For many years past, this fishery has been carried on from this island, and from New-Bedford, a large commercial and flourishing town on the coast, in its neighbourhood, and has employed from fifteen thousand to eighteen thousand tons of shipping, principally in the Southern Seas. Although Great Britain has, at various times, given large bounties to her ships employed in this fishery, yet the whalemens of Nantucket and New-Bedford, unprotected and unsupported by any thing but their own industry and enterprise, have generally been able to meet their competitors in a foreign market. The value of spermaceti, and common, whale oil, whalebone, and spermaceti candles exported since 1802, has been as follows:—

	Whale (common) oil and bone.	Spermaceti oil and candles.
	<i>Dolls.</i>	<i>Dolls.</i>
1803	280,000	175,000
1804	310,000	70,000
1805	315,000	163,000
1806	418,000	182,000
1807	476,000	139,000
1808	88,000	33,000
1809	169,000	136,000
1810	222,000	132,000
1811	78,000	273,000
1812	56,000	141,000
1813	2,500	10,500
1814	1,000	9,000

The common whale oil finds a market in the West Indies, Great Britain, France, Spain, and Portugal. The greatest part of the spermaceti oil is carried to Great Britain. The late war between the United States and Great Britain has again almost annihilated the cod, and whale, fisheries. While in the years previous to the restrictive system and the war, the fisheries furnished articles for exportation to an amount of more than three millions of dollars, in 1814 the exports of the produce of the fisheries was reduced to the sum of 188,000 dollars.

There have been many statutes passed for the encouragement of the Greenland whale fisheries, which it is unnecessary to do more than refer to, and *that* is most appositely done in the body of the last statute on the subject, 55 Geo. 3. c. 39. It enacts that an act made in the 26 Geo. 3. intituled, "An act for the further support and encouragement of the fisheries carried on in the Greenland Seas and Davis's Streights," which was to be in force for five years, from the twenty-fifth day of December 1786; and also so much of an act, made in the 29 Geo. 3 in-

titled, "An act for further encouraging and regulating the Newfoundland, Greenland, and Southern whale fisheries, as relates to the fisheries carried on in the Greenland Seas and Davis's Streights;" which, by an act made in the 32 Geo. 3. were amended and continued until the twenty-fifth day of December 1798; and which were by several subsequent acts further continued; and by two acts passed in the 42d and 44th years of Geo. 3. were amended and further continued; and by three acts, of the 46th, 48th, and 50th Geo. 3. were further continued until the twenty-fifth day of March 1815, shall be revived from the said twenty-fifth day of March 1815, and further continued until the twenty-fifth of March 1820.

And further, that an act made in the 46th of Geo. 3. intituled, "An act for allowing, until the signature of preliminary articles of peace, vessels employed in the Greenland whale fishery to complete their full number of men at certain ports," shall be and the same is hereby revived, from the expiration thereof, and shall be continued from thence until the twenty-fifth day of March 1820. By stat. 1 Geo. 4. c. 33., continued to 31st January, 1824, by stat. 3 Geo. 4. c. 104. several laws relating to the encouragement of the Greenland whale fisheries, and allowing vessels employed therein to complete their full number of men at certain ports, are amended and continued.

Southern Whale Fishery.—By 53 Geo. 3. c. 155. (which was for renewing the charter of the India Company, and regulating their trade,) it is enacted by sect. 32. that it shall not be lawful for any vessel fitted and clearing out conformably to the 35 Geo. 3. for regulating the *Southern Whale Fishery*, to go to, touch at, or stay at, any port or place upon the continent of Asia, from the river Indus to the town of Malacca inclusive, or to any island under the government of the said India Company to the north of the Equator, nor to the said Company's factory at Bencoolen, or its dependencies, nor to the dominions of the emperor of China, without a licence in writing from the Court of Directors specially authorising the same.

The 55 Geo. 3. c. 45. recites, that it is proper to encourage the fishery carried on by his majesty's European subjects in the seas to the southward of the Greenland Seas and Davis's Streights, for the purpose of taking whales and other creatures being in those seas, by continuing certain premiums granted by 51 Geo. 3. "for continuing the premiums allowed to ships employed in the Southern Whale Fishery;" and enacts, that the several premiums after mentioned shall be paid and allowed to certain ships or vessels employed in the said fishery, under the limitations, &c. contained in the said act, and also in an act of 35 Geo. 3. mentioned in the said act, and under the limitations,

restrictions, and regulations expressed in this present act.

For eight of such ships or vessels which shall be so fitted and cleared out between the first day of January and the thirty-first day of December 1815, and between the first day of January and thirty-first day of December in each of the four succeeding years, and shall sail to the southward of the Equator and there carry on the fishery, and shall return before the first day of December in the year subsequent to that in which they cleared out to some port in Great Britain, there shall be paid and allowed three hundred pounds to each of the eight such ships which shall so sail and first arrive within the times hereinbefore mentioned with the greatest quantity of oil or head-matter taken together, being not less in the whole than twenty tons in each of such ships or vessels, and being the produce of one or more whale or whales or other creatures being in those seas taken and killed by the crews of every such ship or vessel respectively. Sect. 2.

And for four other such ships or vessels which shall be so fitted or cleared out, and shall sail within the time hereinbefore mentioned, and proceed to the southward of thirty-six degrees of south latitude, and shall there *bonâ fide* carry on the said fishery, and shall not return until after the expiration of fourteen calendar months from the day on which they cleared out, but before the thirty-first day of December in the second year after their clearing out, to some port in Great Britain, there shall be paid and allowed four hundred pounds to each of such ships or vessels which shall so sail and arrive within the time hereinbefore last mentioned with the greatest quantity of oil and head-matter taken together, being not less in the whole than twenty tons, and being the produce of any whale or whales or other creatures being in those seas, and taken and killed by the crew of such ship or vessel. Sect. 3.

And for ten other ships or vessels which shall be so fitted and cleared out between the first day of January and the thirty-first day of December 1815, and between the first day of January and the thirty-first day of December in each of the four succeeding years, and shall double Cape Horn, or pass through the Streights of Magellan into the South Seas, and carry on the said fishery during the space of four months to the westward of Cape Horn in those seas, or shall double the Cape of Good Hope and carry on the said fishery during the space of four months to the eastward of one hundred and five degrees of east longitude from London, and shall not return to some port of Great Britain until after the expiration of sixteen calendar months from the day on which they cleared out; but before the thirty-first day of December in the second year after their clearing out, there shall be paid

and allowed six hundred pounds to any one of such ships or vessels which shall so sail and arrive within the times herein last mentioned with the greatest quantity of oil and head-matter taken together, being not less in the whole than thirty tons, and being the produce of any whale or whales or other creatures being in those seas and taken and killed by the crew of such ship or vessel in the said voyage, either outward or homeward; and there shall be paid and allowed five hundred pounds to each of nine of such ships and vessels last before mentioned, which shall so sail and arrive within the times herein last before mentioned, with the next greatest quantity of oil and head-matter taken together, being not less in the whole than thirty tons, and being the produce of any whale or whales or other creatures being in those seas and taken and killed by the crew of such ship or vessel in the said voyage, either outward or homeward. Sect. 4.

And all ships which shall clear out for the Southern Whale Fishery, and shall return to any port in Ireland with a cargo of oil the produce of the said fishery within the period limited by this act, shall be entitled to all the benefits and advantages arising from bounties, remission of duties, or otherwise, granted by the said recited acts of the 35 and 51 Geo. 3. in the like manner and to the same extent as if such ships had returned to any port in Great Britain. Sect. 5.

And no boat used as, and commonly called, a *whale boat*, belonging to any ship or vessel employed in the said fishery to the Greenland seas or Davis's Streights, or in the fishery carried on in the seas to the southward of the Greenland Seas and Davis's Streights, shall be liable to seizure for or on account of her built, dimensions, or construction; provided, on the return of such ship or vessel from the fisheries at the end of every season, such boat shall be laid up by the owner or owners thereof in such place or places as shall be approved of by the principal officer of his majesty's customs of the port at which such ship or vessel shall arrive, and shall not be employed or made use of in any way whatever but in the said fisheries. Sect. 6.

FISH-HOOK, or FISHING-HOOK, (*Fish-hooks.* GER. *Angeln, Fischangeln.* DU. *Hoeken.* DA. *Medekroge.* SW. *Krokar, Metkrokar.* FR. *Hameçons.* IT. *Ame.* SP. *Anzuelos.* PORT. *Anxoes.* RUS. *Udi.* POL. *Wedy,*) in general, ought to be long in the shank, somewhat thick in the circumference, the point even and straight; the bend should be in the shank. For setting the hook on, use strong but small silk, laying the hair on the inside of the hook; for if it is on the outside, the silk will fret it and cut it asunder.

FISHING-NETS. The assize of nets are regulated by the act of 1 Geo. 1. c. 18. s. 4. Old nets, for making paper, may be imported duty free. 2 Geo. 1. c. 7. s. 10.

FITCH, or VETCH, a small kind of wild bean, which is esteemed excellent fodder for horses.

FLAG, a general name for colours, standards, ancients, banners, ensigns, &c. which are frequently confounded with each other. The fashion of pointed or triangular flags, as now used, came from the Mahometan Arabs, or Saracens, upon their seizing Spain, before which time all the ensigns of war were stretched, or extended on cross pieces of wood, like the banners of a church. The pirates of Algiers, and throughout the coasts of Barbary, bear an hexagonal flag.

Flag is more particularly used at sea, for the colours, ancients, standards, &c. borne on the top of vessels, to notify the person who commands the ship, or what nation it is, and whether it is equipped for war or trade. The admiral in chief carries his flag on the maintop; the vice-admiral on the foretop; and the rear-admiral on the mizentop. Besides the national flag, merchant-ships frequently bear lesser flags on the mizen-mast, with the arms of the city where the master ordinarily resides; and on the foremast, with the arms of the place where the person who freights them lives.

"*To lower or strike the Flag,*" is to pull it down upon the cap, or to take it in, out of respect or submission, due from all ships or fleets inferior to those any way justly their superiors. To lower or strike the flag in an engagement is a sign of yielding. The way of leading a ship in triumph is to tie the flags to the shrouds or the gallery, in the hind part of the ship, and let them hang down towards the water, and to tow the vessels by the stern.

"*To heave out the Flag,*" is to put out, or put abroad, the flag.

"*To hang out the white Flag,*" is to ask quarter; or it shows when a vessel is arrived on a coast, that it has no hostile intention, but come to trade, or the like.

The red flag is a sign of defiance or battle. **FLAGEOLET,** (IT. *Flauticello,*) a small flute, blown by means of a little ivory pipe with flexible sides, placed at top of the instrument.

FLAG-OFFICERS, those who command the several squadrons of a fleet, such as the admirals, vice-admirals, and rear-admirals. The flag-officers in our pay are the admiral, vice-admiral, and rear-admiral, of the white, red, and blue.

FLAG-SHIP, a ship commanded by a general or flag-officer, who has a right to carry a flag, in contradistinction to the secondary vessels under its command.

FLAG-STAVES, are staves set on the top-gallant-masts, serving to let fly, or unfurl, the flag.

FLAGON, a vessel or measure of wine, containing two quarts.

FLANEL, or FLANNEL, (GER. and SW. *Flanell.* DU. DA. and RUS. *Flanel.* FR.

Flanelle. Ir. *Flanella*. Sr. *Franela*, *Flanella*. Port. *Baetilha*. Pol. *Flanela*,) a kind of slight, loose, woollen stuff, composed of a woof and warp, and woven on a loom with two treadles, after the manner of baize. The flannels of England and those of Wales are most esteemed, of which large quantities are exported.

FLASK, (*Flasks*. GER. *Flaschen*. Du. *Vlessen*. DA. *Flasker*. Sw. *Flasker*. Fr. *Flacons*. Ir. *Fiascha*, *fiaschetta*. Sp. and Port. *Frascos*, *Redomas*. Rus. *Sklanki*. Pol. *Flaszy*,) is a thin glass bottle, which is generally used to hold Florence oil, and as such is imported by us from Italy. The flasks of oil are always wickered, and then packed up in small chests and half chests. Some flasks are made in different parts of England, principally for home use.

FLAT, in the sea language. "To flat in the foresail," is to hale it in by the sheet, as near the ship's side as possible; which is done when a ship will not fall off from the wind.

FLATTERS. See **GOLD** and **SILVER WIRE-DRAWERS**.

FLAX, (GER. *Flachs*. Du. *Vlasch*. DA. *Hör*, *Hærr*. Sw. *Lin*, *Hör*. Fr. *Lin*. Ir. and Sp. *Lino*. Port. *Linho*. Rus. *Len*, *Lon*. Pol. *Len*. LAT. *Linum*,) is a plant having a slender, round, hollow stalk, about two feet high: its bark is full of filaments, like hemp; the leaves are long, narrow, and pointed; it bears a blue flower, to which succeeds a roundish fruit about the size of a pea, containing ten little seeds, full of an oily substance or meal. There are 25 species, of which the most remarkable are, 1. The *usitatissimum*, or common annual flax. 2. The *perenne*, or perennial Siberian flax, with umbellate clusters of large blue flowers. The first species is cultivated in the fields for the use of the manufacturers. The second sort is chiefly ornamental.

For the cultivation of flax, a free, open, deep loam; and all grounds that produced the preceding year a good crop of turnips, cabbage, potatoes, barley, or broad-clover, or have been formerly laid down rich, and kept for some years in pasture, are best. If seed is sown early, and the flax not allowed to stand for seed, a crop of turnips may be got after the flax that same year; the second year a crop of rye or barley may be taken; and the third year, grass-seeds are sometimes sown along with the linseed. Of preceding crops, potatoes and hemp are the best preparation for flax. If the ground be free and open, it should be but once ploughed, and that as shallow as possible. It should be laid flat, reduced to a fine garden-mould by harrowing, and all stones and sods should be carried off; except a little pigeons' dung for cold or sour ground, no other dung should be used; because it produces too many weeds, and throws up the flax thin and poor upon the stalk. The brighter in co-

lour, and heavier the seed is, the better; that which when bruised appears of a light or yellowish green, fresh in the heart, oily, and smells and tastes sweet, may be depended upon. Dutch seed of the preceding year's growth, for the most part, answers best; but it seldom succeeds if kept another year. It ripens sooner than any other foreign seed. Philadelphia seed produces fine lint and few bolls, and answers best in wet cold soils. The quantity of linseed sown should be proportioned to the condition of the soil; for if the ground be in good heart, and the seed sown thick, the crop will be in danger of falling before it is ready for pulling. The time for sowing linseed is from the middle of March to the end of April, as the ground and season answer. Late sown linseed may grow long, but the flax upon the stalk will be long and poor. Flax ought to be weeded, when the crop is about four inches long; if longer deferred, the weeders could not avoid breaking or bending the stalks. Quicken grass should be taken up; for, being strongly rooted, the weeding of it always loosens a great deal of the lint. If there be an appearance of a settled drought, it is better to defer the weeding, than by that operation to expose the tender roots of the flax to the drought. When the crop grows so short and branchy as to appear more seed than flax, it ought not to be pulled before it is thoroughly ripe; but if it grows long and not branchy, the seed should be disregarded, and all the attention given to the flax. In the last case it ought to be pulled after the bloom has fallen, when the stalk begins to turn yellow, and before the leaves fall, and the bolls turn hard and sharp-pointed. When the stalk is small, and carries few bolls, the flax is fine; but the stalk of coarse flax is gross, rank, branchy, and carries many bolls. When the flax has fallen, and lies, such as lies ought to be immediately pulled, whether it has grown enough or not, as otherwise it will rot altogether. When parts of the same field grow unequally, only what is ready should be pulled, and the rest should be suffered to stand till it ripens. The flax-raiser ought to be at pains to pull and keep by itself each different kind of lint which he finds in his field; what is long and fine by itself; what is long and coarse by itself; what is short and fine by itself; what is short and coarse by itself; and in like manner every other kind by itself that is of the same size and quality. If the flax be more valuable than the seed, it ought by no means to be stacked up; for its own natural juice assists it greatly in watering; whereas, if kept long unwatered, it loses that juice, and the harle adheres so much to the boon, that it requires longer time to water, and even the quality of the flax becomes harsher and coarser. Besides, the flax stacked up is in great danger from ver-

min and other accidents; the water in spring is not so soft and warm as in harvest; and near a year is lost of the use of the lint; but if the flax is so short and branchy as to appear most valuable for seed, it ought, after pulling, to be stacked and dried upon the field, as is done with corn; then stacked up for winter, rippled in spring; and the seed should be well cleaned from bad seeds, &c. If the flax is to be regarded more than the seed, it should, after pulling, be allowed to lie some hours upon the ground to dry a little, and so gain some firmness, to prevent the skin or harle, which is the flax, from rubbing off in the rippling; an operation which ought by no means to be neglected, as the bolls, if put into water along with the flax, breed vermin there, and otherwise spoil the water. The bolls also prove very inconvenient in the grassing and breaking. The handfuls for rippling should not be great, as that endangers the lint in the rippling comb. After rippling, the flax-raiser will be able to assort each size and quality of the flax by itself more exactly than he could before. In watering, a running stream wastes the lint, makes it white, and frequently carries it away. Lochs, by the great quantity and motion of the water, also waste and whiten the flax. Both rivers and lochs water the flax quicker than canals. The greater way the river or brook has run, the softer, and therefore the better, will the water be. Springs, or short runs from hills, are too cold, unless the water is allowed to stand long in the canal. Water from coal or iron is injurious. A little of the powder of galls thrown into a glass of water will discover if it comes from minerals of that kind, by turning it into a dark colour, more or less tinged in proportion to the quantity of metal it contains. When the water is brought to a proper heat, small plants will be rising quickly in it, numbers of small insects and reptiles will be generating there, and bubbles of air rising on the surface. If no such signs appear, the water is scarcely warm enough, or is otherwise unfit for flax. Moss-holes, when neither too deep, nor too shallow, frequently answer well. The proper season for watering flax, is from the end of July to the end of August; doing this as soon as possible after pulling is very advantageous. The flax being sorted after rippling, as before mentioned, should next be put in beets, never larger than a man can grasp with both his hands, and tied very slack with a band of a few stalks or rushes. The beets should be put into the canal slope-ways, half standing upon end, the root-end uppermost. Upon the crop-ends, when uppermost, vermin frequently breed, destructive of the flax, which are effectually prevented by putting the crop-end downmost. The whole flax in the canal ought to be carefully covered from the sun with divots; the grassy side

of which should be next the flax, to keep it clean. If it is not thus covered, the sun will discolour the flax, though quite covered with water. If the divots are not weighty enough to keep the flax entirely under water, a few stones might be laid above them; but the flax should not be pressed to the bottom. When the flax is sufficiently watered, it feels soft to the gripe, and the harle parts easily, with the boon or show, which last is then become brittle, and looks whitish. When these signs are found, the flax should be taken out of the water, beet after beet; each gently rinsed in the water, to cleanse it of the filth which has gathered about it in the canal; and as the lint is then very tender, and the beet slackly tied, it must be carefully and gently handled. Great care ought to be taken that no part be over done, and as the coarsest imbibes water soonest, if different kinds are mixed together, a part will be rotted, when the rest is not sufficiently watered. When lint taken out of the canal is not found sufficiently watered, it may be laid in a heap for 12, 18, or 24 hours, which will have an effect like more watering; but this operation is nice, and may prove dangerous in unskilful hands. After the flax is taken out of the canal, fresh lint should not be put a second time into it, until the former water is run off, and the canal cleaned, and supplied with a fresh quantity of water. Short heath is the best field for grassing flax; as, when wet, it fastens to the heath, and is thereby prevented from being blown away by the wind; the heath also keeps it a little above the earth, and so exposes it more equally to the weather. Long-grass grounds should be avoided, as the grass will grow through the lint, and frequently spots, tenders, or rots it: grounds exposed to violent winds should also be avoided. The flax, when taken out of the water, must be spread very thin upon the ground; and being then also very tender, it must be gently handled; it ought never to be spread during a heavy shower, as that would wash and waste the harle too much, which is then excessively tender, but soon after becomes firm enough to bear rains, which, with the open air and sunshine, cleans, softens, and purifies it to the degree wanted, and makes it blister from the boon. In short, after the flax has got a little firmness by being a few hours spread in dry weather, the more rain and sunshine it gets the better. If there be little danger of high winds carrying off the flax, it will be much the better for being turned about once a week; if not turned, it ought to be the more thinly spread. The spreading of flax and hemp, which requires a great deal of ground, enriches it greatly. The flax-raiser should spread his first row of flax at the end of the field opposite to the point whence the most violent wind commonly comes, placing the root-ends foremost; he makes the root-ends of every other row

overlap the crop-ends of the former row three or four inches, and binds down the last row with a rope; by which means the wind does not easily get below the lint; and as the crop-ends are seldom so fully watered as the root-ends, the over-lapping has an effect like giving the crop-ends more watering. A dry day ought to be chosen for taking up the flax; and if there be no appearance of high wind, it should be loosed from the heath or grass, and left loose for some hours, to make it thoroughly dry. As a great quantity of flax can scarcely be all equally watered and grassed, and as the different qualities will best appear at lifting the flax from the grass; therefore at that time each different kind should be gathered together, and kept by itself; that is, all of the same colour, length, and quality. The smaller the beets lint is made up in, the better for drying, and the more convenient for stacking, &c. and in making up these beets, as in other operations upon flax, it is of great consequence that the lint be laid together as it grew, the root-ends together, and the crop-ends together.

Exclusive of the large quantities of flax grown in the United Kingdom, especially in Ireland, the importation is very considerable from Riga, Narva, Petersburg, and Flanders. Of the flax imported from the Baltic, that from Riga deserves the preference. The laws for the encouragement of the manufacture of flax and cotton, were amended and continued by 3 Geo. 4. c. 25.

FLAX-DRESSER. The flax-dresser prepares the flax for the spinners, by combing it on heckles of different degrees of fineness, according to the nature of the flax, and the uses for which it is designed.

FLAX-SEED, or LINSEED, (GER. Leinsaat. DU. Leinzaad. DA. Hørrfrø. SW. Linfrö. FR. Graine de lin, Lin, Linette. IT. Linseme. SP. Linaza. PORT. Linhacha. RUS. Semja lenjanoe. POL. Sieme lniane. LAT. Lini semen.) The seed which produces the flax is chiefly imported by us from Holland, as well as from Philadelphia, New York, Boston, and other parts of North America. This seed has many useful properties; it is employed in the composition of several medicines, and from it is drawn by expression the oil, denominated linseed-oil, which in quality is not unlike the oil of nuts, for which it is sometimes used in painting, and burning. That which is drawn without the help of fire is used in medicine. The Dutch flax-seed is the best sort we import.

FLEECE, the covering of wool, shorn off the bodies of sheep. See WOOL.

FLEECY-HOSIERY, (GER. Englicher ges und heits flanell, Gewirktes pelzwerk. FR. Tricotage à toison,) a very useful kind of manufacture, in which fine fleeces of wool are interwoven into a cotton piece of the common stocking texture, making stockings, socks, waistcoats, and other clothing, for

persons afflicted with complaints requiring warmth, and for common use in cold climates.

FLEET, commonly implies a company of ships of war, belonging to any prince or state; but sometimes it denotes any number of trading ships, employed in a particular branch of commerce.

In sailing, a fleet of men of war is usually divided into three squadrons; the admiral's, the vice-admiral's, and the rear-admiral's squadron; all which, being distinguished by their flags and pendants, are to put themselves, and, as near as may be, to keep themselves, in their customary places, viz. the admiral, with his squadron, to sail in the van, that so he may lead the way to all the rest in the day-time, by the sight of his flag on the maintop-mast head; and in the night-time, by his lights or lanterns. The vice-admiral and his squadron are to sail in the centre, or middle of the fleet; the rear-admiral, and the ships of his squadron, to bring up the rear; but sometimes other divisions are made, and those composed of the lighter ships and the best sailers, are placed as wings to the van, centre, and rear.

Merchant fleets generally take their denomination from the place they are bound to, as the Turkey fleet, East India fleet, Jamaica fleet, Leeward Island fleet, Lisbon fleet, &c.; these, in time of peace, go in fleets for their mutual aid and assistance: in time of war, besides this security, they likewise procure convoys of men of war, to escort them to the places whither they are bound, or to a certain place or latitude. Ships taking the benefit of convoy obtain a return of premium on the insurance effected on the ship and cargo; for which see INSURANCE.

FLINT, (Gun-flints. GER. Feuersteine, Flintensteine. DU. Vuursteen. DA. Fyrstene, Ildstene. SW. Bössflintor. FR. Pierres à fusil, à briquet, à feu. IT. Pietre focaje. SP. Pedernales. PORT. Pedreiras. RUS. Kremen. POL. Krgemien, Skalka. LAT. Lapis Sclopetarius, Pyromachus,) a stone very useful in modern war; is found in pieces of different sizes, and usually of a figure more or less globular, commonly among chalk, and often arranged in some kind of order; its texture is compact, its fracture smooth; always covered with a white crust; specific gravity from 2.58 to 2.63; colour varies from honey-yellow to brownish-black; very brittle, and breaks into splinters in every direction; two pieces of flint rubbed smartly together phosphoresce, and emit a peculiar odour. The manufacture of gun-flints, &c. is chiefly confined to England, and two or three departments of France; the operation is exceedingly simple, and a good workman will make 1000 flints a day; the whole art consists in striking the stone repeatedly with a kind of mallet, and bringing off at each

stroke a splinter, sharp at one end, and thicker at the other; the splinters are afterwards shaped at pleasure, by laying the line at which it is wished they should break, upon a sharp instrument, and then giving them small blows with a mallet. Flints are an article of exportation to the East Indies, particularly to China.

FLOAT of a *fishing-line*, the cork or quill that floats or swims above the water.

Float also signifies a certain quantity of timber, bound together with rafters athwart, and put into a river to be conveyed down the stream; and even sometimes to carry burdens down a river with the stream.

FLOAT-BOARDS, those boards fixed to water-wheels of undershot mills, serving to receive the impulse of the stream, whereby the wheel is carried round.

FLOCKS, coarse locks of the long sort of wool, generally in use for ordinary bedding, and for mattresses.

FLOOD, among seamen, is when the tide begins to come up, or the water begins to rise; then they call it young-flood, after which it is quarter-flood, half-flood, and high-flood.

FLOOD-MARK, the mark which the sea makes on the shore, at flowing-water, and at the highest tide; it is also called high-water mark.

FLOOKING, among miners, a term used to express a peculiarity in the load of a mine. The load or quantity of ore is frequently intercepted in its course, by the crossing of a vein of earth or stone, or some different metallic substance, in which case the load is moved to one side, and this transient part of the load is called a flooking.

FLORIN, a species of coin, of different value, according to the different countries in which it is current. The French florin, an imaginary money, is equivalent to 1*s.* 0½*d.*; the florin of the Netherlands, also imaginary, passes for 1*s.* 6*d.*; the golden florin of Holland, for 2*s.* 7½*d.*; the silver florin of Poland, Prussia, Germany, and Livonia, for 1*s.* 2*d.*; the Italian florin of exchange, for 1*s.* 6⅔*d.*; and the common florin of Italy, an imaginary money, for 9*d.* See **MONIES** in *App.*

FLOTA, in Spanish commerce, implies the same as the appellation Fleet does among us. See **GALLEONS**.

FLOTSAM, *Jetsam*, and *Lagan*. *Flotsam* is when a ship is sunk or cast away, and the goods float on the sea; *Jetsam* is when a ship is in danger of being sunk, and to lighten the ship the goods are cast into the sea, and the ship notwithstanding perishes; and *Lagan* is when the goods so cast into the sea are so heavy that they sink to the bottom, and therefore the mariners fasten to them a buoy or cork, to enable them to find them again. 5 *Rep.* 106. *b.* The king shall have flotsam, jetsam, and lagan, when the ship is

lost, and the owners of the goods are not known, but not otherwise, F. N. B. § 122. Where the proprietors of goods may be known, they have a year and a day to claim flotsam. See **INSURANCE**.

FLOUR, (*GER.* *Feines mehl*, *Semmelmehl*. *DUT.* *Bloem*. *DA.* *Sigtet meel*. *SW.* *Siktadtmjöl*. *FR.* *Fleur de farine*. *IT.* *Fiore*. *SP.* *Flor*. *PORT.* *Flor de farinha*.) the meal of wheat-corn, finely ground and sifted. There are three qualities of flour, denominated *firsts*, *seconds*, and *thirds*, of which the first is the purest. The Scotch flour is of inferior quality. Flour-mills are put in motion by the application of various forces: wind, water, steam, and sometimes, but very rarely now, by animals. The mechanism of the grinding part of these is nearly the same, and well understood. Flour is frequently imported by us from New York, Philadelphia, and many other parts of America, in barrels. See **AMERICA** and **CORN**.

FLUTE, (*Flutes.* *GER.* *Flöten*. *DUT.* *Fluiten*. *DA.* *Fløjter*. *SW.* *Flojter*. *FR.* *Flûtes*. *IT.* *Flauti*. *SP.* *Flautas*. *PORT.* *Frautas*. *RUS.* *Fleitii*. *POL.* *Flety*.) is an instrument of music, the simplest of all those of the wind kind. There are two sorts of flutes, the common, and the *German* flute; the former is played on by blowing it with the mouth, and the tones or notes are changed by stopping, or opening, the holes disposed for that purpose along its sides; the latter is entirely different, the top is stopped with a tampion, or plug, and the lower lip is applied to a hole about two inches and a half, or three inches, distant from the end. This instrument is usually about a foot and a half long, rather larger at the upper end than the lower, and perforated with holes, besides that for the mouth, the lowest of which is stopped, and opened, by the little finger's pressing on a brass, or sometimes a silver key, like those in hautboys, bassoons, &c.

FLY-BOAT, a large vessel with a broad bow, used in the coasting-trade, some of which carry 800 tons.

FODDER, or **FOTHER**, in mining, a measure containing twenty-two hundred and a half weight, though in London but twenty hundred weight. Eight pigs of lead are called a fodder or fother of lead. See **WEIGHTS** and **MEASURES**.

FOIL, among glass-grinders, a sheet of tin, incorporated with quicksilver, &c. laid on the back of a looking-glass to make it reflect. See **FOLIATING**.

Foil, among jewellers, a thin leaf of metal placed under a precious stone, in order to increase its brilliancy, or give it an agreeable and different colour. These foils are made of either copper, gold, or gold and silver together; the copper foils are commonly known by the name of Nurenberg, or German foils. They are prepared as follows: procure the thinnest copper-plates; beat them gently upon a well-polished anvil,

with a polished hammer, as thin as possible; and placing them between two iron plates, as thin as writing-paper, heat them in the fire; then boil the foils in a pipkin, with equal quantities of tartar and salt, constantly stirring them till by boiling they become white; after which, taking them out and drying them, give them another hammering till they are made fit for the purpose; care must be taken not to give the foils too much heat, for fear of melting; nor must they be too long boiled, for fear of attracting too much salt. The manner of polishing these foils is to take a plate of the best copper, one foot long, and about five or six inches wide, polished to the greatest perfection; bend this to a long convex, fasten it upon a half roll, and fix it to a bench or table; then take some chalk, washed clean, and filtered through a fine linen cloth, till it is as fine as possible; and having laid some on the roll, and wetted the copper all over, lay the foils upon it, and with a polishing-stone and the chalk, polish them till they are as bright as a looking-glass; after which they must be dried, and laid up secure from dust.

FOLIATING of *looking-glasses*, the spreading the plates over, after they are polished, with amalgam, in order to reflect the image. A thin blotting-paper is spread on the table, and sprinkled with fine chalk; and then a fine lamina or leaf of tin, called foil, is laid over the paper; upon this mercury is poured, which is to be distributed equally over the leaf with a hare's foot, or cotton; over this is laid a clean paper, and over that the glass plate, which is pressed down with the right hand, and the paper drawn gently out with the left: this being done, the plate is covered with a thicker paper, and loaded with a greater weight, that the superfluous mercury may be driven out, and the tin adhere more closely to the glass. When it is dried, the weight is removed, and the looking-glass is complete. Some add an ounce of marcasite, melted by the fire; and lest the mercury should evaporate, pour it into cold water; and when cooled, squeeze it through a cloth or through leather. Some add a quarter of an ounce of tin and lead to the marcasite, that the glass may dry the sooner.

Foliating of globe looking-glasses, is done as follows: take five ounces of quicksilver, and one ounce of bismuth; of lead and tin half an ounce each: first put the lead and tin into fusion, then put in the bismuth, and when you perceive that in fusion too, let it stand till it is almost cold, and pour the quicksilver into it; after this, take the glass globe, which must be very clean, and the inside free from dust; make a paper funnel, which put into the hole of the globe as near to the glass as you can, so that the amalgam, when you pour it in, may not splash, and cause the glass to be full of spots; pour it gently, in and move it about, so that it may touch every where. If you find the amal-

gam begin to get curdly and fixed, then hold it over a gentle fire, and it will easily flow again; and if you find it too thin, add a little more lead, tin, and bismuth to it. The finer and clearer your globe is, the better will the looking-glass be.

FOLIO, or **FOLIUM**, in books of accounts, is applied to the page or leaf of a journal, ledger, &c. in which the account of any transaction, &c. is recorded, the whole book being paged, or *folioed*, as merchants term it.

Folio, among booksellers, signifies a large book, the pages of which are formed by a sheet of paper once doubled.

FOOT is a long measure, consisting of twelve inches. Geometricians divide the foot into ten digits, and the digit into ten lines.

Foot, square, is the same measure both in breadth and length, containing 144 square or superficial inches.

Foot, cubic, or solid, is the same measure in all the three dimensions, length, breadth, and depth of thickness, containing 1728 cubic inches. The foot is of different lengths in different countries. The Paris royal foot exceeds the English by nine lines; the ancient Roman foot of the capital consisted of four palms, equal to $11\frac{1}{2}$ inches English. Rhineland or Leyden foot, by which the northern nations go, is to the Roman foot as 950 to 1000. The proportion of the principal feet of several nations, compared with the English, are as follow:—

The English foot being divided into 1000 parts, or into twelve inches, the other feet will be as follow:—

	1000 pts.	feet.	inch.	lines.
London foot	1000	0	12	0
Amsterdam	942	0	11	3
Antwerp	946	0	11	2

Foot of the forest, *pes forestæ*, in our ancient customs, contained 18 inches, or $1\frac{1}{2}$ of the common foot.

FORE-CASTLE of a ship, that part where the foremast stands. It is divided from the rest by a bulk-head. See *SHIP*.

FORE-FOOT, in the sea-language, signifies one ship's lying, or sailing, across another's way; as if two ships being under sail, and in ken one of another, one of them lying in her course with her stem so much a-weather the other, that holding on their several ways, neither of them altering their courses, the windward ship will run a-head of the other; then it is said, such a ship lies with the other's fore-foot.

FOREIGN Attachment. See *ATTACHMENT, Foreign*.

Foreign Courts. Upon a principle of the law of nations, every state being free, independent, and uncontrollable, the sentence of any foreign court of competent jurisdiction is not to be called in question, but is admitted as evidence of the fact upon which it is founded. If, however, in such sentence any foreign jurisdiction should state the evidence, upon which its sentence or device is founded, subsequent evidence may be admitted to disprove such evidence, and consequently the sentence or decree which is a deduction from it. But where it is peremptorily given as a sentence, it is conclusive evidence which the English courts will not allow to be questioned.

FOREIGNERS, are persons subject to a foreign state, to which they owe an allegiance, and although made free denizens or naturalized in Great Britain, they are nevertheless expressly disabled by the act of settlement from bearing offices in the government, from being members of the privy council, or members of parliament. See *ALIENS*.

FOREIGN Plantations; a writ of error lies here upon any of the judgments in foreign plantations, or in any dominions belonging to Great Britain. *Vaugh.* 402.

Foreign state, is the dominion of a foreign power. Thus, if any foreign subject purchase goods in London, and then depart privately to his own country, the owner of the goods may have a certificate from the Lord Mayor of London, on an affidavit being made of the sale and delivery of the goods, upon which the proper court, in that state, will execute a legal process upon the party. At the instance of an ambassador also, or consul, any criminal flying from justice to any foreign state, may be delivered up to the laws of the country where the crime was committed. Where any contract is made abroad, if the party be resident in England, it may be recovered by the English courts. Lending money to a foreign prince, without licence, prohibited. 3 Geo. 2. c. 5.

Foreign seamen, serving two years on board British ships, whether of war, trade,

or privateers, during the time of war, shall be deemed natural-born subjects.

FOREMAST of a ship, that which carries the fore-sail and fore-top-sail yards. Its length is usually $\frac{2}{3}$ of the main-mast; and the fore-top-gallant-mast is half the length of the fore-top-mast.

FOREMAST-MEN, are those on board a ship that take in the top-sails, sling the yards, furl the sails, bowse, trice, and take their turn at the helm, &c.

FORE-REACH, in the sea-language: a ship is said to fore-reach upon another, when, both sailing together, one sails better, or outgoes the other.

FORESTALLING, is the buying or bargaining for any corn, cattle, or any merchandise, by the way, before it comes to other market or fair to be sold; or by the way, as it comes from beyond the seas, or otherwise, towards any city, port, haven, or creek of this realm, to the intent to sell the same again at a higher price. At the common law, all endeavours to enhance the price of any merchandise, and all the practices which have an apparent tendency thereto, whether by spreading false rumours, or by purchasing things in a market before the accustomed hour, or by buying and selling again the same thing in the same market, or by any other such-like devices, are highly criminal, and punishable by fine and imprisonment. 1 *Haw.* 234. And by 12 Geo. 3. c. 71. several statutes made from time to time against these offences in general were repealed. But though these offences are no longer combated by these statutes, they are still punishable upon indictment at the common law, by fine and imprisonment; as also by 3 & 4 Edw. 6. c. 19. which remains unrepealed by 12 Geo. 3. as to cattle.

And in a recent case it has been decided, that the following are offences at common law not done away by the repeal of the stat. 5 & 6 Edw. 6. c. 14, *Rex v. Waddington. Hil.* 41 Geo. 3. 1 *East's Rep.* 143.

Spreading rumours with intent to enhance the price of any commodity in the hearing of the growers, dealers, and others, that the stock is nearly exhausted, and there will be a scarcity, with intent to induce them not to bring the commodity to market for sale for a long time, and thereby greatly to enhance the price:

Endeavouring to enhance the price by persuading divers dealers not to take the commodity to market, and to abstain from selling for a long time:

Engrossing large quantities, by buying from many particular persons by name, certain quantities, with intent to resell the same for an unreasonable profit, and thereby to enhance the price:

Getting into his hands large quantities, by contracting with various persons for the purchase, with intent to prevent the same being brought to market, and to resell at an

exorbitant profit thereby, and buying large quantities with the like intent :

Engrossing a commodity while growing, by forehand bargains with like intent, such as buying all the growth in particular parishes, or the like :

And to forestall any commodity which is become a common victual and necessary of life, or used as an ingredient in the making or preservation of any victual, though not formerly used or considered as such (as for instance hops), is an offence at common law.

FORGE, properly signifies a small furnace, in which smiths and other artificers of iron or steel, &c. heat their metals red-hot, in order to soften and render them more malleable and manageable on the anvil. The forge used by the several operators in iron is very simple : we shall instance that of the blacksmiths, to which all the rest are reducible, the construction of which is as follows : The hearth or fire-place of the forge is to be built up from the floor with brick, about two feet and a half, or more, according to the purpose. If the forge be intended for heavy work, the hearth must lie lower than it need be for light work ; the forge may be of what breadth is thought convenient. It may be built with hollow arches underneath, to make convenient receptacles : the back of it is built upright to the top of the ceiling, and inclosed over the fire-place with a hovel, which ends in a chimney to carry away the smoke. In the back of the forge, against the fire-place, is fixed a thick iron plate, with a taper pipe in it about five inches long, which pipe comes through the back of the forge. Into this taper pipe is placed the nose or pipe of the bellows : the office of this is to preserve the pipe of the bellows, and the back of the forge about the fire-place, from burning. Immediately before the back is placed, at about two feet distance, the trough, which reaches commonly the whole breadth of the forge, and is as broad as is thought necessary. The bellows is placed behind the back of the forge, having one of its boards so fixed, that it can neither move upwards nor downwards. At the ear of the upper board is fastened a rope or chain, which reaches up to the rocker, and is fastened there to the furnace end of the handle. This handle is fastened across a rock-staff, which moves between two cheeks upon the centre-pins, in two sockets ; so that by drawing down this handle the moving board of the bellows rises ; and by a considerable weight set on the top of its upper board, sinks down again, and by this alternate motion performs the office of a pair of bellows.

Forge is also used for a large furnace, in which iron ore, taken out of the mine, is melted down ; or it is more properly applied to another kind of furnace, where the iron ore, melted down and separated in a former furnace, and then cast into sows and

pigs, is heated and fused over again, and beaten afterwards with large hammers, and thus rendered more soft, pure, ductile, and fit for use. Of these there are two kinds : the first is called the finery, where the pigs are worked into gross iron, and prepared for the second, which is called the chafery, where it is further wrought into bars fit for use.

FORGERY, is where a person counterfeits the signature of another with intent to defraud, which by the law of England is made a capital felony. Forgery may be committed by making a mark in the name of another person : it may also be committed in the name of a person who never had existence : and it may be committed of an instrument, though such an instrument as the one forged does not exist either in law, or fact. Indorsing a real bill of exchange with a fictitious name is forgery ; although the use of a fictitious name was *n.º* essential to the negotiation. It was so decided respecting a forged *indorsement* on a bill of exchange, in Bolland's and in Tuft's cases, at the Old Bailey (1 *Leach C. L.* 97, and 2 *Leach*, 206.) ; in Taylor's case, respecting a forged *receipt* on a similar instrument (4 *Term R.* 28.) ; and, lastly, as to *drawing* a bill of exchange in a fictitious name, in Nashe's case, at the Old Bailey, in 1815. A forged note, made in imitation of a Bank note, although the word *pound* be omitted in the body of it, or although there be no water-mark on the paper, is a counterfeit note for the payment of money. Altering an entry of money received, made by a cashier of the Bank, in the bank-book of a person keeping cash there, by prefixing a figure to increase the amount of the sum received, is forging a receipt for money. But if a person, who has for many years been known by a name which was not his own, afterwards assume his real name, and in that name draw a bill of exchange, he will not be guilty of forgery, although such bill was drawn for fraudulent purposes. If any person shall falsely make, forge, or counterfeit, or cause or procure to be falsely made, forged, or counterfeited, or willingly aid or assist in falsely making or counterfeiting, any deed, will, bond, writing obligatory, bill of exchange, promissory note for payment of money, acquittance, or receipt, either for money or goods, with intent to defraud any person ; or shall utter or publish the same as true, knowing the same to be false, forged, or counterfeited, he shall be guilty of felony without benefit of clergy ; but not to work corruption of blood, or disherison of heirs. 2 *Geo. 2. c. 25.* Forging or imitating stamps to defraud the revenue is forgery by the several stamp acts ; and the receiving of them is made single felony, punishable with seven years' transportation. 12 *Geo. 5. c. 48.* Counterfeiting the signature of a member of parliament to the

direction of a letter, with intent to defraud the revenue of the post-office, is also made a forgery by statute, punishable by transportation. But the statutes respecting this offence, as well as the decided cases, are so extremely numerous, and so diversified, that for the former we must refer the reader to 1 *Dick. Pract. Expos.* p. 549, and for the latter to *Leach. C. L. and E. P. C.*

FORGING, in smithery, the beating or hammering iron on the anvil, after having first made it red-hot in the forge, in order to extend it into various forms, and fashion it into works. There are two ways of forging and hammering iron; one is by the force of the hand, in which there are usually several persons employed: the other is by the force of a water-mill, or other equivalent power of machinery, which raises and works several huge hammers beyond the force of man; to the strokes of which the workmen present large lumps or pieces of iron, which are sustained at one end by the anvils, and at the other end by iron chains fastened to the ceiling of the forge. This last way of forging is only used in the largest works, as anchors for ships, &c. which usually weigh several thousand pounds. For the lighter works, a single man serves to hold, heat, and turn with one hand, while he hammers with the other. Each purpose the work is designed for requires its proper heat; for if it be too cold, it will not feel the weight of the hammer, (as the smiths call it, when it will not batter under the hammer;) and if it be too hot, it will red-sear, that is, break or crack under the hammer. The several degrees of heat the smiths give their irons, are, first, a blood-red heat; secondly, a white-flame heat; and thirdly, a sparkling or welding heat.

FORLE, or **FULLE**, a copper coin, made and current in Egypt; it is also called *bulbe* or *bulba*.

FORM, *Printer's*, an assemblage of letters, words, and lines, ranged in order, and so disposed into pages by the compositor; from which, by means of ink and a press, the printed sheets are drawn. Every form is inclosed in an iron chase, or frame, wherein it is firmly locked by a number of pieces of wood; some long and narrow, and others of the form of wedges. There are two forms required for every sheet, one for each side; and each form consists of more or fewer pages, according to the size of the book. See **PRINTING**.

FOSSIL, denotes in general all things dug out of the earth, whether they have been formed there by nature, as metals, stones, salts, earths, and other minerals, or deposited in the bowels of the earth by earthquakes, deluges, or other extraordinary means. See **METAL**, **STONE**, and **MINERALS**.

FOUANG, or **FOANG**. See **BAAT**.

FOUL, in the sea language, is used when

a ship has been long untrimmed, so that the grass, weeds, or barnacles, grow to her sides under water. A rope is also foul, when it is either tangled in itself, or hindered by another, so that it cannot run or be overhauled.

Foul imports also the running of one ship against another. The damages occasioned by running foul, are of the nature of those in which both parties must bear a part. They are usually made half to fall upon the sufferer, and half upon the vessel which did the injury: but in cases where it is evidently the fault of the master of the vessel, he alone bears the damage.

FOUL-WATER. A ship is said to make foul-water, when, being under sail, she comes into such shoal-water, that though her keel does not touch the ground, yet it comes so near it, that the motion of the water under her raises the mud from the bottom.

FOUNDER, an artist who casts metals, in various forms, for different uses, as guns, bells, statues, printing characters, candlesticks, buckles, &c. whence they are denominated gun-founders, bell-founders, figure-founders, letter-founders, founders of small works, &c.

FOUNDERY, or **FOUNDRY**, is the place or workhouse which is furnished with forges, or furnaces, for melting, and casting, all sorts of metals, particularly brass, iron, bell-metal, &c.

The sand used in casting brass, &c. is yellowish, and soft; but after it has been used, it becomes black, on account of the charcoal dust used in the moulds.

Every time this sand is to be used, they work and tew it several times over a board about a foot square, which is placed over a kind of trunk or box, into which it may fall from off the board. This tewing is performed with a roller or cylinder about two feet long, and two inches in diameter, and a species of knife made of the blade of a sword; with these two instruments the sand is rolled, and cut, alternately, and is at length turned down into the box or trough underneath.

Then taking a wooden board, or table, of a length, and breadth, proportionate to the quantity of things to be cast, the workman puts round this a frame or ledge, and thus makes a sort of mould. This is afterwards filled with the sand before prepared, and moderately moistened; which done, they take either wooden, or metallic, models or patterns of the things intended to be cast, apply them on the mould, and press them down in the sand, so as to leave their form indented; along the middle of the mould is placed half a little cylinder of brass, which is to be the master-jet or canal for running the metal; being so disposed as to touch the ledge on one side, and only to reach the last pattern on the other; from this are placed several lesser jets or branches, reaching to

each pattern, whereby the metal is conveyed through the whole frame.

The first frame being thus finished, they turn it upside down, and take out the patterns from the sand, to effect which, they first loosen them a little all round with a small cutting instrument.

They next proceed to work the counterpart or other half of the mould after the same manner, with the same patterns, exactly similar to the former, excepting that it has pins, which, entering into corresponding holes on the other, make, when both are joined together, the two cavities of the pattern fall exactly upon each other.

The frame being thus moulded, is carried to the melter or founder, who, after enlarging the principal jet, or canal, of the counterpart, with a kind of knife, adding the cross-jets or canals to the several patterns in both, and sprinkling them over with mill-dust, sets them to dry in an oven.

When both parts of the mould are sufficiently dried, they are joined together by means of pins; and to prevent their starting or slipping aside by the force of the metal, which is poured in flaming hot through a hole contrived at the master-jet, they lock them in a kind of press, either with screws, or, if the mould be too large for this, with wedges.

The moulds thus put in the press, are ranged near the furnace, to be in readiness to receive the metal as it comes out of the crucible.

While the moulds are thus preparing, the metal is put in fusion in an earthen crucible, of a size proportionate to the quantity of metal intended to be cast.

Some of the smaller work-founders' furnaces are like a smith's forge; others stand a few feet under ground, for the more easily and safely taking out a pot of metal, which is done by means of circular tongs, that grasp round the top of the crucible.

When the metal is melted, the workman pours it through the chief canal of each mould, which conveys it to every distinct pattern.

When the moulds become cool, the frames are unscrewed or unwedged, and the cast-work taken out of the sand, the latter of which is worked over again for other castings.

Such is the process of founding articles in general use; there are also various descriptions of founderies upon a larger scale; as founderies of statues, cannon, bells, types, &c. the processes of which are different, according to the respective articles upon which they are employed.

FOUNDING. See FOUNDERY.

FOUNT, or FONT, among printers, a set or quantity of letters, and all the appendages belonging thereto, as numeral characters, quadrats, points, &c. cast by a letter-founder, and sorted. Founts are large or small,

according to the demand of the printer, who orders them by the hundred weight, or by sheets. When a printer orders a fount of five hundred, he means that the fount, consisting of letters, points, spaces, quadrats, &c. shall weigh 500 lbs. When he demands a fount of ten sheets, it is understood, that with that fount he shall be able to compose ten sheets, or twenty forms, without being obliged to distribute, that is, take them to pieces. See PRINTING.

FOX-SKINS. There is, perhaps, no animal whose fur is subject to greater variety than the fox. The skin of this quadruped in the south of Europe is generally red; but in some parts of America, Asia, and the north of Europe, there are black, white, grey, variegated, and fawn-coloured foxes. The fox-skins of these parts of the world are greatly superior to ours, especially the black and white, which are uncommonly fine, and sell at very high prices. The Turks and Russians are the chief traders in the fox-skins of the north of Europe. We import some of the article from Asia, but more from North America. Fox-skins are employed in the making of muffs, tippets, trimmings for garments, &c.

FRAIL, a basket made of rushes, &c. in which figs, raisins, and the like, are packed up. It usually contains about 75 lb. weight.

FRAMES, (*GER. Rahmen, Einfassung. Du. Raamen, Raamten. DA. Ramer. Sw. Ramar. FR. Cadres. IT. Quadri, Cornici. Sr. Marcos de cuadros. PORT. Quadros. Rus. Ramù. POL. Ramy,*) or engines for weaving stockings. Penalties for exporting them 7 & 8 W. 3. c. 20. s. 6. Frame-work knitters are within 12 Geo. 1. concerning combinations of workmen, c. 34. s. 8. and frames are protected by divers statutes, particularly 57 Geo. 3. c. 126. which makes it felony to destroy them. This statute, however, will expire in 1820. 3 *Dick. Pract. Expos.* 684. To prevent imposition in the manufacture of stockings, see act of 6 Geo. 2.

FRAME-WORK-KNITTING, is an expeditious mode of knitting stockings, by means of a frame made of steel or polished iron. This invention has been variously attributed; by some to William Lee, M. A. of St. John's College, Cambridge, at so early a period as 1589, whilst by others it has been fixed at a much later period, and the credit of the invention has been assigned to a student at Oxford, who, having providently married a poor young woman, an innkeeper's daughter, and being reduced to extreme distress, they entirely supported themselves by knitting stockings, at which the woman was very expert; the student invented a species of loom or frame-work which is now become common, and which enables us to export silk-stockings, in vast quantities, and to great advantage, to those

very countries whence we formerly used to import them, and others of a different texture to most parts of the world.

FRANC, or **FRANK**, an ancient coin, either of gold or silver, struck and current in France. See **MONIES** in *App.*

FRANKFORT-BLACK, (GER. *Kupferdruckerschürze*. Du. *Franforten zwartzel*. Da. *Tydsksvært*. Sw. *Fysksvårta*. FR. *Noir d'Allemagne*. IT. *Nero di Germania*. SP. *Negro de Alemania*. PORT. *Negro de Aleanha*.) See **BLACK**.

FRANKINCENSE. (GER. *Weihrauch*. Du. *Wierook*. Da. *Virog*, *Virak*. Sw. *Veirrauch*, *Virack*. FR. *Encens*, *Encens fin ou mâle*, *Oliban*. IT. *Incenso*, *olibano*. SP. *Incenso*, *Incenso macho*, *Olibano*. PORT. *Incenso*, *Incenso macho*, *Olibano*. RUS. *Ladon*, *prostoi*. POL. *Kadzidlo*. LAT. *Thus*, *Olibanum*.) See **GUM Olibanum**.

FRAUD, is any deceitful practice contrary to the plain rules of common honesty. It is necessary, however, here to observe, that in these impositions or deceptions, where common prudence might guard persons from the offence, the party cannot be indicted, but the person injured is left to his remedy by action; but when false weights or measures are used, or such methods taken to defraud or deceive, as people cannot by ordinary care and prudence guard against, there the affair is indictable.

If an infant goes about the town, and, pretending to be of age, defrauds persons, by taking credit for goods, and then insisting on his nonage, the person injured cannot recover the value of the goods, but may indict and punish the infant so falsely obtaining credit as a common cheat.

Producing papers, purporting to be orders from abroad, and under pretence of being a merchant, obtaining goods, or to sell spirituous wine for a genuine commodity, under pretence of being a merchant and broker, have been held to be false pretences, and will consequently subject the party to an indictment.

By 33 Hen. 8. persons falsely or deceitfully obtaining or getting into their hands or possession any money, goods, chattels, jewels, or other things, of any other person, by colour and means of any privy false token or counterfeit letter, made in another name to a special friend or acquaintance, for the obtaining money, and who shall be convicted thereof, shall be liable to the punishment of imprisonment or the pillory.

By 30 Geo. 2. c. 24. all persons who knowingly and designedly, by false pretence or pretences, shall obtain from any person money, goods, wares, or merchandises, with intent to cheat or defraud any person of the same, shall be deemed offenders against law and the public peace; and the court before whom such offenders shall be tried, shall, in case they be convicted of any of the said offences, order such offenders to be fined and

imprisoned, or publicly whipped, or to be transported as soon as conveniently may be, according to the laws made for transporting of felons, for the term of seven years, as the court shall think fit. Sect. 1.

And by 52 Geo. 3. c. 64. the offence is extended to the fraudulently obtaining bonds, bills of exchange, bank-notes, promissory-notes, or other securities for payment of money, warrants and orders for payment of money, or delivery of goods, and all other valuable things. See 1 *Dick. Pract. Expos. title Cheat*.

FRAUDS, Statute of, 29 Car. 2. s. 3. This is one of the most important laws in our statute book. The inclination of the courts of law seemed, for a considerable time, to be for taking cases out of this statute by some legal nicety; but, of late years, courts of justice have favoured a more strict interpretation. See *Howe v. Palmer*, 3 B. & A. 321. *Tempest v. Fitzgerald*, 3 B. & A. 684. The clauses which are most important to mercantile readers will be shortly adverted to.

The 4th section enacts, that no action shall be brought to charge persons with the contracts therein mentioned, or with the debt, &c. of another person, unless the agreement, &c., or some memorandum thereof, be reduced into writing. In the construction of this clause it was decided, in *Wain v. Warlters*, 5 East, 10., which case has since been recognized by the Courts of King's Bench and Common Pleas, that not only the agreement, but the consideration for such agreement, must be in writing. *Jenkins v. Reynolds*, 3 B. & B. (C. P.) 14. and *Saunders v. Wakefield*, 4 B. & A. (K. B.) 595. Mercantile persons should therefore (particularly in taking guarantees, which must always be in writing,) be careful, before coming to the agreement, to insert some such words as the following:—"In consideration that you will furnish A. B. with such and such goods, &c. we engage," &c.

The question in cases of guarantee, as to whether any agreement comes within this clause of the statute, always is, whether the goods, &c. were actually furnished and sold to the party sued, or to the third person, or, in other words, whether the third person be liable. If the third person be liable, and the person sued only chargeable in his default, the case is strictly within the statute, and must be reduced to writing; but if the goods are really sold to the party sued, and delivered to a third person, then a verbal contract is sufficient, provided it does not come within the 17th clause of the statute, which will now be adverted to.

By the 17th section of the statute, no contract for sale of goods, &c. for the price of 10*l.* or upwards, shall be good, unless the buyer shall accept part of the goods, &c. or give some earnest, &c. or some note or memorandum in writing, of such bargain being made and signed by the party to be charged, &c., or his agent, &c.

The memorandum of a broker is in general considered as binding the parties, as being the signature of a person who is regarded in law as the agent of both parties. There are other important clauses in the statute which do not come within the compass of this work.

FREE - CITIES. See **HANSE-TOWNS.**

FREEDOM of a **CORPORATION**, the right of enjoying all the privileges belonging to it, is regularly obtained by serving an apprenticeship of seven years: but sometimes purchased, and sometimes conferred by way of compliment.

FREEZE, or **FRIEZE**, (*GER. Fries. Du. Vries. DA. Fries. SW. Fris. FR. Frison, Reveche. IT. Frisa, Rovescio. SP. & PORT. Frisa. RUS. Boika. POL. Kucbaia.*) a coarse kind of woollen stuff, or cloth, for winter wear; so called as being friezed or napped on one side. The manufacture of friezes is chiefly confined to Yorkshire.

FREIGHT, in navigation and commerce, is the consideration of money agreed to be paid for the use or hire of a ship, or, in a larger sense, the burden of such ship. The freight is most frequently determined for the whole voyage, without respect to time; sometimes it depends on time: in the former case it is either fixed at a certain sum for the whole cargo, or so much per ton, barrel bulk, or other weight or measure, or so much per cent. on the value of the cargo.

When a whole ship is freighted, if the master suffer any goods, besides those of the freight, to be put on board, he is liable for damages. If the voyage be completed according to the agreement, without any accident, the master has a right to demand the freight before the delivery of the goods; but if such delivery is prevented by negligence or accidents, the parties will be reciprocally responsible as follows. If the merchant should not load the ship within the time agreed on, the master may engage with another, and recover damages. If the merchant recalls the ship after she is laden and sailed, he must pay the whole freight; but if he unloads before the ship has actually sailed, he will in such case only be responsible for damages. If the merchant load goods which it is not lawful to export, and the ship is prevented from proceeding on that account, he must nevertheless pay the freight. If the master is not ready to proceed on the voyage at the time stipulated, the merchant may load the whole or part of the cargo on board another ship, and recover damages; but any real casualties will release the master from all damages. If an embargo is laid on the ship before she sails, the charter-party is dissolved, and the merchant pays the expenses of loading and unloading; but if the embargo is only for a short limited time, the voyage shall be performed when it

expires; and neither party is liable for damages.

If the master sails to any other port than that agreed on, without necessity, he must sail to the port agreed on at his own expense, and is also liable for any damages in consequence of it.

If a ship is taken by the enemy, and retaken or ransomed, the charter-party continues in force. If the master transfers the goods from his own ship to another, without necessity, and they perish, he is responsible for the full value, and all charges; but if his own ship is in imminent danger, the goods may be put on board another ship at the risk of the owner.

If a ship is freighted out and home, and a sum agreed for the whole voyage, nothing becomes due until the return of the ship. If a certain sum is specified for the homeward voyage, it is due, although the correspondent abroad should have no goods to send home. A ship was freighted to a particular port and home, a particular freight agreed upon the homeward voyage, with an option reserved for the correspondent to decline it, unless the ship arrived before a certain day. The master did not go to the port agreed on, and therefore became liable to damages; the obligation being absolute on his part, and conditional only on the part of the freighter.

If the goods are damaged without fault of the ship or master, the owner is not obliged to receive them and pay the freight, but he must either receive or abandon the whole; he cannot receive those that are not damaged, and reject the others. If the goods are damaged through the insufficiency of the ship, the master is liable for the same; but if it is owing to stress of weather he is not accountable.

If part of the goods is thrown overboard, or taken by the enemy, the part delivered pays freight.

The master is accountable for all the goods received on board by himself and mariners, unless they perish by the act of God, or the king's enemies. The master is not liable for leakage of liquors, nor accountable for contents of packages, unless packed in his presence. See **CHARTER-PARTY.**

FRENCH BERRIES. (*GER. Fransche Beirer. Du. Geele Besser. DA. Avignonsfrö. IT. Coccoli di spincervino.*) The berries of the *Rhamnus infectorius* (*Nerprun de Teinturiers*) are used considerably in the middle and south of France, to give a yellow dye. They are gathered unripe, bruised, steeped, and then boiled in water, mixed with the ashes of vine stalks to give a body, and then passed through fine linen. The colour thus prepared is called *stil de grain*. It is a fine yellow, chiefly used in silk-dyeing, but is very fugitive, especially in the sun. They grow abundantly in the south of France,

and particularly at Avignon, whence their French name of *Graines d'Avignon*.

FRIESLAND GREEN, called also Brunswick green, is made by moistening copper filings with a solution of sal ammonia, in close vessels; the precipitate is washed and dried. This preparation is employed with oil, and also for staining paper.

FRIGATE, a ship of war. A frigate has commonly two decks, whence that called a light frigate is a frigate with only one deck. All ships of war that carry from twenty to fifty guns, are called frigates. *See SHIP*.

FRIGATOON, a Venetian vessel, commonly used in the Adriatic Sea, with a square stern, and carrying only a mainmast, mizen, and bowsprit.

FRINGE, (*GER. Fransen. Du. Franjes. DA. Frynder. Sw. Fransar. FR. Franjes. IT. Franje. SP. and PORT. Franjas. RUS. Buchrama. POL. Frezli*.) a well-known ornament for dress, or furniture, usually composed of silk, thread, gold, silver, or flaxen threads. The making of gold and silver fringe, frogs, and tassels, is performed by the lacemen; but is chiefly done by women upon the hand. The making of silk fringe is performed in the loom by the livery-lace weavers. Silk fringe is prohibited from being imported. 13 & 14 Car. 2. c. 15. s. 2.

FRIIT, or **FRIIT**, in the glass manufacture, is the matter or ingredients of which glass is to be made, when they have been calcined or baked in a furnace. There are three kinds of frit: the first, crystal frit, or that for crystal or clear glass, is made with salt of pulvarine and sand. The second and ordinary frit is made of the bare ashes of the pulvarine or barilla, without extracting the salt from them. This makes the ordinary white or crystal glass. The third is frit for green glasses, made of common ashes, without any preparation. This last frit will require ten or twelve hours baking. The materials in each are to be finely powdered, washed, and seared; then equally mixed, and frequently stirred together in the melting pot. *See GLASS*.

FRONTINAC, a luscious French white wine. *See WINE*.

FRUIT. (*GER. Obst, Früchte. Du. Ooft. DA. Frugt. Sw. Fruckt. FR. Fruit. IT. Frutta, Frutte. SP. and PORT. Fruta. RUS. Owoschtsch. POL. Owoc. LAT. Fructum*.) The appellation of fruit is bestowed by commercial men upon those species of fruit, such as oranges, lemons, almonds, raisins, currants, apples, &c. &c. which constitute articles of importation from foreign countries. The chief countries of Europe which export fruit are France, Spain, Portugal, and some islands in the Mediterranean.

Every person who shall bark any fruit-tree, shall forfeit to the party grieved treble damages by action at the common law, and also 10*l.* to the king. 37 Hen. 8. c. 6.

Every person who shall rob any orchard

or garden, or dig or pull up any fruit-trees, with intent to take the same away, (the same not being felony by the laws of this realm,) shall, on conviction before one justice, give to the party such satisfaction for damages as such justice shall appoint; and in default of payment to be whipped. 43 Eliz. c. 7.

And with respect to what shall be deemed felony by the laws of this realm, the distinction seems to be, that if they are any way annexed to the freehold, as trees growing, or apples growing upon the trees, then taking and carrying them away is not felony, but trespass only, for a man cannot steal part of a freehold; but if they are severed from the freehold, as wood cut, or apples gathered from the trees, then the taking of them is not a trespass only, but felony. *Id.*

Fine and imprisonment may be inflicted on persons destroying fruit-trees. 1 Geo. 1. c. 48.

FRUITERER, a dealer in all kinds of foreign and domestic fruit.

FULLER. The business of the fuller is to clean, scour, mill, and thicken, woollen cloths; and is chiefly to be met with in the countries where the woollen manufacture flourishes: there are, however, several of this business in and about London.

FULLERS' EARTH, (*GER. Walkerde. Du. Vålärde. DA. Walkejorde. Sw. Valklera, Valkjord. FR. Terre à foulon. IT. Terra da purgatori. SP. Tierra de batan. PORT. Greda de pizoeiro. RUS. Schiffernaia glina. LAT. Terra fullonum*.) a species of clay, of a greyish ash-coloured brown, in all degrees from very pale to almost black, and it has generally something of a greenish cast. It is very hard and firm, of a compact texture, of a rough and somewhat dusty surface that adheres slightly to the tongue. It is very soft to the touch, not staining the hands, nor breaking easily between the fingers. It has a little harshness between the teeth, and melts freely in the mouth. Thrown into water, it makes no ebullition or hissing; but swells gradually in bulk, and falls into a fine soft powder. It makes no effervescence with nitrous acid. This earth is used by fullers to take grease out of their cloth before they apply the soap. It is essential to fullers' earth that the particles of silica should be very fine, otherwise they would cut the cloth. Any clay possessed of this property may be considered as fuller's-earth; for it is the alumina alone which acts upon the cloth, on account of its strong affinity for greasy substances. Fuller's-earth is found in many parts of England, but that which Hampshire produces is esteemed the best. There is a species of this earth found in some parts of Turkey which is considered of great use in medicine.

Fullers' earth, fulling and scouring clay, penalties on exporting them, 12 Car. 2. 13 & 14 Car. 2. 9 & 10 Will. 3. c. 40. 6 Geo. 1. c. 21. s. 32.

FULLING is the art of cleansing,

scouring, and pressing cloths, stuffs, and stockings, to render them stronger, closer, and firmer: it is also sometimes called *milling*.

The process of fulling cloths is performed by a species of water-mill, thence called a *fulling* or *scouring* mill.

The cloths intended for fulling are generally first dipped in urine, then in a solution of fullers' earth and water, and lastly in soap, dissolved in hot water. Some think the urine ought to be abandoned, both on account of its disagreeable smell and its sharp saline properties, which frequently render the cloths dry and harsh.

The alternate pressure, communicated by the pestles and stampers to the stuff under operation, occasions, in its advanced stages, an effect analogous to that produced upon hats in the operation of felting: thus the fibres of wool which compose one of the threads, whether of the warp or woof, assume a progressive motion, first introducing themselves amongst those of the contiguous threads, then into those which follow, so that gradually all the threads both of the warp and woof become completely felted; consequently it may be cut without being liable to unravel; and further, as the threads of both the warp and woof are more intimately combined, the web which acquires a greater degree of thickness, forms likewise a warmer clothing.

Stockings, caps, &c. are fulled in a mode something different from that of mills, which is either by the feet or hands, or a kind of rack or wooden machine armed with teeth of the same materials, or, which would be an improvement, horses' or bullocks' teeth.

In this process, also urine, green soap, white soap, and fullers'-earth, are employed. Stockings manufactured in a loom should be fulled with soap alone, but earth may likewise be added for dressing those that have been knit.

By this process, knit worsted hose are less subject to *run*, if a stitch should happen to drop.

FUN, a Chinese weight. It is likewise a species of money of uncertain value.

FUNDS, Public. When the practice was first adopted of borrowing money of individuals for defraying the extraordinary expenses of the state, the produce of some particular tax was generally appropriated as the fund, out of which the principal and interest of the debt was to be discharged. The possession of the acknowledgment given to government for the money advanced, establishing a right to receive the payments from the fund originally agreed upon, the sale of these securities was considered as a sale of the claim upon the fund, and as the acknowledgments given were of different kinds, the general application of the pro-

vision on which they rested was found more convenient for purposes of business: thus the sale, or purchase, of the government securities was commonly called the sale or purchase of the public funds, till at length the expression has so far varied from its original signification, that instead of meaning the revenue out of which public debts or the interest of them is payable, it denominates the capital of such debts, in which sense it is generally used. Variations in the saleable value of the public funds at first were caused chiefly by political events, which were supposed to affect either the authority of those by whom the debts were contracted, or the means of paying them; but since their great increase has induced many persons to make buying, and selling, shares therein a regular trade, the fluctuations of the current price in general depends principally on the proportion of buyers to sellers, and on the schemes and combinations in which they engage in support of their respective speculations. The chief part of the public funds consists of perpetual annuities, or those debts on which a stipulated rate of interest is to continue to be paid, unless the principal should be redeemed; the other parts consist of annuities for a certain number of years, and life annuities. The perpetual annuities are distinguished by different titles, according to the rate of interest they pay, or the time and purpose of their creation; and when government, by a new loan, contracts an additional debt, bearing a certain fixed interest, it is usual to add the capital thus created to the amount of that part of the public debt which bears the same interest and denomination, and to add the produce of the taxes imposed for payment of the interest of such new debt to the fund provided for paying the interest of the former capital, thus consolidating the old and new debts, and making the interest payable out of the general produce of the same fund; hence we have 3 per cent. 4 per cent. and 5 per cent. consolidated annuities. The reduced 3 per cent. annuities take their title from having originally consisted of sums which had been borrowed at higher rates of interest, and reduced at different periods to 3 per cent. The navy 5 per cents. are so called from having been created by funding navy and victualling bills. The long annuities have been granted at different periods, and for different terms. The short annuities expired 5th January, 1808. The imperial 3 per cent. annuities, and annuities for 25 years, arose from loans to the emperor of Germany, the dividends on which were guaranteed by the government of this country.

The public funds were formerly all payable and transferrable at the exchequer; but they are now generally payable at the Bank or South Sea house. The dividend payable

to the proprietors of Bank stock is 7 per cent. ; on South Sea stock $3\frac{1}{2}$ per cent. Transfers of stock in any of the government funds, if made on the appointed transfer days, are free from any expense to the parties, but the same stock cannot be transferred twice on the same day. The person who transfers property in the funds, or his broker, must be known to the witnessing clerk, or some person known must be produced to vouch for his being the identical person he is represented to be. The seller's receipt should be kept by the buyer, as a voucher for the transfer, till one dividend has been received.

The dividends on Bank stocks are payable the day after they become due ; but the dividends on the stock of other companies, and on the government funds, are not payable till about a week after. The space between the shutting, and opening, the books of any stock, is usually about six weeks. At the time of shutting, the dividends due are carried to a separate account, and cannot be transferred with the stock of the proprietor, the warrants being filled up in the name the stock stands in when the books shut, and of course are payable only to him or his attorney. All letters of attorney, to sell, or accept, stock, or to receive dividends, should be taken out at the respective offices, in order that the description may exactly accord with that in the Bank books, and there must be a separate letter of attorney for each different stock. Letters to sell must be deposited in the proper office prior to sale, as must also probates of wills, till registered. Acting personally, after granting a letter of attorney, revokes the power of the letter. Any one trustee, after the acceptance of the whole trust, may receive dividends ; and, upon the death of any of the trustees being proved by producing their wills, or a certificate of burial, the survivor may transfer the stock.

Persons having occasion to invest money in the public funds, generally employ a broker, to whom the party must give his name, place of abode, and usual additions, with the sum intended to be purchased ; but a work, called "*Every Man his own Broker*," contains every thing necessary to be known by persons transacting business in the funds ; it is therefore more than unnecessary to enter more minutely into the subject here.

If a broker be employed, the *mode* of effecting the transaction rests with him ; and if no such assistance be sought, much more instruction than could be conveyed consistently with our prescribed limits, would be essentially necessary.

With respect to powers of attorney, it may be necessary to observe, that they are to be had only at the respective offices where the stock lie, whether at the Bank, South Sea or India houses. Of these, some are only for receiving dividends, some for buying, and others for selling ; and general ones are for buying and selling, and receiving of dividends. These last convey an absolute and unlimited power, and have sometimes been given by ignorant persons in the room of others, who have thereby put their property into the hands of those who have made a bad use of it. The misapplication of powers confided to bankers, brokers, and others, respecting the buying, selling, &c. of government, and other, public securities, gave occasion to stat. 52 Geo. 3. c. 63., by which it is enacted, that if any banker, broker, merchant, or other agent, in whose hands any money, bill, note, draft, cheque, or order for the payment of money, shall be placed, with orders in writing signed by the party depositing the same, to invest such money, or the money to which such bill, note, &c. shall relate, in the purchase of any stock, or other government, or other securities, or in any other way specified in such order, shall *in any manner apply to his own use and benefit* any such money, bill, note, &c. *in violation of good faith*, &c. and with intent to defraud, shall be deemed guilty of a misdemeanor, and shall be sentenced to transportation for a term not exceeding 14 years. The persons above described are also prohibited, by another section of the statute, from selling or pledging any debenture, bill, or other security, and from transferring, assigning, or negotiating any debenture, bill, or other security, with a similar intent, under a similar penalty.

As the prices of the several funds are continually fluctuating, and there is frequently a considerable difference in the interest produced by investing money in different funds, the following table of the prices which each fund should be at, to produce an equal interest, will be found very useful to persons investing their money in these securities.

TABLE, shewing the comparative Value per Cent. of the several Public Funds, and the annual Interest produced by 100*l.* invested at different Prices.

Various causes contribute to alter the prices of the funds. In proportion as the demands of government increase, the interest of money will rise; and individuals, from a prospect of employing their money more advantageously in new loans, will sell out of the old funds; especially those which bear the lowest interest. This will happen as early as possible, because the advantage will be the greater; therefore speculators will crowd to market as soon as they have intelligence of a rupture with any considerable power, that they may sell before the fall increases.

Should the events of war prove unsuccessful, and we lose valuable settlements abroad, the funds will fall, from a concurrence of sellers, many of them merchants, who depend on remittances from the conquered places, and for want of them are obliged to part with their funded property. The apprehensions of more misfortunes will likewise engage others in the same predicament.

Powerful alliances formed against the in-

terest of the kingdom, having a tendency to endanger its political existence as an independent state, will affect the funds; for the public defence must require unusual supplies, which, increasing the value of money, by the great demand for it, will lower the price of the old funds.

It is scarcely necessary to observe, that occurrences of a contrary complexion must tend to an opposite result.

When the nation enjoys perfect tranquillity, when there is no sudden large demand for money, nor any considerable sums in specie poured into the kingdom, no variation beyond two per cent. in the price of the funds ought to take place: if it do, independent of the following causes, it may be considered as *artificial*, and a *trick of the alley*.

1st. Orders from foreigners to vest very considerable sums in the funds, at any stated times.

2dly. Any extraordinary demand for stock, in consequence of large remittances from our foreign possessions: or,

3dly. The concurrence of any fortuitous external demand, at the moment of a periodical demand for stock, by the commissioners for liquidating the national debt.

Of the last-mentioned subject, as immediately connected with the public funds, it is necessary to say something before we close this article.

By 26 Geo. 3. c. 31. commissioners were appointed for the reduction of the national debt, and it was enacted that 250,000*l.* shall be set apart quarterly out of the surplusses of the sinking fund; and in case of a deficiency in the said surplusses, the same shall be carried on as a charge, on the subsequent quarters.

Surplusses remaining (after former incumbrances are provided for) shall be applied in payment of former deficiencies, and of so much of the quarterly sum of 250,000*l.* as they will extend to pay. *Ibid.*

Deficiencies at the end of any year shall be made good out of the supplies granted the same year. *Ibid.*

The monies set apart quarterly, shall be paid into the Bank; and shall be applied in reducing the national debt. Officers of the exchequer are not to issue the produce of the sinking fund, before payment of the 250,000*l.* quarterly, and the redeemed stock shall be transferred to the commissioners, and the dividends shall be received by the Bank, and placed to the commissioners' account. *Ibid.*

When any stock shall be placed to the account of the commissioners, no money shall be issued for the management thereof. And monies placed to the account of the commissioners shall be applied in redemption of annuities at or above par. *Ibid.*

The commissioners are empowered, if they shall think expedient, to subscribe towards any public loan; and the speaker of the house of commons, the chancellor of the exchequer, the master of the rolls, the accountant-general in chancery, and the governor and deputy governor of the Bank, for the time being respectively, shall be commissioners, who are to appoint clerks and officers. *Ibid.*

The Bank shall pay such money vested in the commissioners, as shall be ordered by them, and shall make up their accounts with them annually, which shall be laid before the parliament annually. *Ibid.*

Commissioners are to lay an account of their proceedings before parliament; and before the commissioners for auditing the public accounts. *Ibid.*

Forging any certificate made by virtue of this act is felony without clergy. s. 21.

By 27 Geo. 3. c. 13. from July 5th 1787, the sum of 250,000*l.* directed by 26 Geo. 3. c. 31. to be set apart at the exchequer quarterly, shall be set apart out of the consolidated fund, and the provisions of that act shall continue in force. *Ibid.*

From May 10th, 1787, all monies reserved for payment of annuities on lives, which shall not have been claimed for three years prior to January 5th, 1787, or which shall thereafter not be claimed for three years, shall be placed to the account of the commissioners for reducing the national debt. *Ibid.*

The exchequer shall transmit, by April 5th annually, an account of annuities fallen in by death, or unclaimed for three years, to the treasury, who are to cause the same to be placed to the account of the said commissioners. *Ibid.*

But if any claimants of annuities so appropriated shall thereafter appear, they are to be paid out of any money applicable for the payment of annuities. *Ibid.*

By 32 Geo. 3. c. 55. the exchequer shall keep a separate account of the interest of new loans, and if provision be not made for paying them off within forty-five years, an additional sum, equal to one-hundredth part of the stock, to be issued from the exchequer quarterly and placed to the account of the commissioners. s. 3.

And if such loans be raised by annuities for any term longer than forty-five years, one-hundredth part of such as may be expected to be then out-standing shall be issued: the computation of such value is to be made under the direction of the commissioners, and copies delivered to the speaker; and the speaker is to certify to the treasury and exchequer the amount of the additional sum to be issued. s. 4.

Sums to be issued under this act to be issued in the order the loans have taken place. s. 5.

Whenever there remains not money of the consolidated fund to pay the further sum to be issued in consequence of any new loan, the deficiency shall be made good, as directed by 26 Geo. 3. c. 91. s. 6.

Any deficiency in the quarterly payments, which may arise at the end of the year, shall be made good out of any supplies granted for the current or any preceding year. s. 7.

Monies placed to the account of the commissioners to be applied in the purchase of such redeemable annuities as shall be at or above par, according to 26 Geo. 3. and the stock redeemed to be transferred to their account, and the dividends to be placed thereto: but sums placed to their account in consequence of any new loan to be kept separate. s. 8.

Persons counterfeiting certificates, guilty of felony without clergy. s. 9.

Subsequent to the passing the act for the redemption of the public debt, an additional annual sum of 200,000*l.* has, under the authority of several acts, annually passed for that purpose, been issued from the exchequer over and above the quarterly sum of 250,000*l.*

And by 42 Geo. 3. c. 71. it is enacted, that the said sum of 200,000*l.* heretofore an-

nually issued shall be a permanent charge, and paid quarterly out of the British consolidated fund to the Bank for the commissioners. s. 4.

The money placed to the account of the commissioners under this and the former acts shall accumulate, and be applied in redemption of the public annuities, until the whole shall be paid off, within forty-five years from their respective creation. s. 5.

By 48 Geo. 3. c. 142. the commissioners for the reduction of the national debt, are empowered to accept transfers of stock in the 3l. per cent. consols, or reduced Bank annuities, for the purchase of life annuities, for a single life, or the life of a nominee; or the lives of two nominees; in doing which, the party may name himself; but the nominees must not be under thirty-five, and previously to the transfer, the parties are to produce certificates or good proof of the age of the nominees. s. 1—5.

The purchasers of life annuities on single lives, upon the transfer of stock in manner directed by the act, are to be entitled to the annuities as specified in the schedule D, and the purchasers of life annuities, on the continuance of two lives, are to be entitled to the annuities specified in schedule E. s. 7, 8, 9.

Annuityants may make further purchases on the lives of original nominees without fresh certificates; but the annuities on the life of one nominee are not to exceed 1000l. nor for two nominees 1500l. s. 12—14.

Persons appointed by the commissioners, for reducing the national debt, may accept stock from the purchasers, the dividends whereof shall be afterwards received, and constitute a part of the sinking fund. s. 14.

The annuities are to be payable half yearly, at the same days as the stock transferred, and on the death of a single life, or the survivor of two lives, after the last half-yearly payment, one quarter's annuity is to be paid to the personal representative, at the next half-yearly dividend. s. 15.

To prevent frauds in the receipt of annuities, certificates must be produced from the minister of the parish, or, in his absence, the churchwardens and overseers, or from some justice, of the existence of the life of the nominee, with an affidavit or affirmation annexed of the identity of the party, upon production whereof at the Bank, the annuity shall be payable. s. 18.

And certificates of the death of a single or surviving nominee must be also produced, to enable the personal representative to receive the quarterly share. s. 19.

These life annuities are transferrable, and are to be free from taxes, except such as dividends of consols and reduced annuities are liable to, and shall be deemed personal estate. s. 20, 21.

Penalty on producing false certificates and affidavits, or receiving annuities after the deaths of nominees, 500l. s. 22, 23.

Annuities ceasing to revert to the sinking fund. s. 24.

The certificates, transfers of stock, and life annuities, are to be exempt from stamp duties. s. 25.

Persons making false affidavits, guilty of perjury. s. 26.

Persons forging registers, certificates, names of witnesses thereto, or the certificate of any judge, baron, justice, or magistrate, or any certificates of the commissioners or cashier, or clerk to the Bank, or the names of persons in any transfer, or any receipt, or letter of attorney, or who shall personate the nominee, or shall utter any such forged certificate, or instrument as aforesaid, shall be guilty of felony without clergy. s. 28.

Penalties may be recovered in the name of the attorney-general at Westminster, or in Dublin, in the court of exchequer, and in Scotland in the name of the advocate-general, to be applied to the sinking fund; but the commissioners may give the informer one half. s. 29.

By 49 Geo. 3. c. 64. the commissioners may grant under the last act annuities of an annual amount for the life of any one nominee, or for the lives of two nominees, and of the life of the longer liver of them, so as the same do not exceed 3000l. per ann.

Several subsequent statutes have passed making further provision for the reduction of the debt, and for the regulation of the commissioners, &c. (*er. gr.*) 53 Geo. 3. c. 35.; 58 Geo. 3. c. 66.; but further notice of them here would exceed our limits. See further, title SINKING FUND. However, a provision, pregnant with consequences of importance, is made by 57 Geo. 3. c. 130.; which directs the Bank of England to open an account, (*on account of the commissioners for the reduction of the national debt*), to be called "the Fund for the Banks for Savings," and to receive any sum not less than 50l. to the same, from these institutions respectively. s. 9, 10.

The commissioners are to issue debentures in favour of such institutions, bearing interest at 3d. per cent. per day. And to lay out all monies so received by them in Bank annuities, with the interests which shall from time to time arise. s. 14.

But these debentures shall not be transferrable. They shall not be liable to stamp duties, and may be renewed if lost; but if any false declaration shall accompany the payment of such monies to the Bank, they shall be forfeited to the commissioners. s. 15, 16, 17.

Accounts to be laid before parliament annually. s. 18.

Investments restricted to saving banks, the rules of which prohibit a subscription of more than 100l. the first year, and of 50l. any year after, except the same shall be contributed by any friendly society. s. 19.

FUR, or FUER, (GER. *Pelzwerk, Rauchwerk. Du. Bont, Bontwerk. Da. Foer-*

verk, Pelsverk. Sw. Foderrverk, Pelsverk. Fr. Fourrure. It. Pellicce. Sr. Peleterna. Rus. Mäehkaja ruchläd. Pol. Futro, Futrowizna, Kosmacizna,) the skins of quadrupeds, which are dressed with alum without depriving them of their hair: the skins chiefly used are those of the sable, ermine, bear, beaver, hare, &c.

The furs used at present are brought from North America by the Hudson's Bay Company, from Russia, and from other northern countries, and are of great value, particularly the skins of bears, ermines, foxes, and sables. The skins of hares and rabbits are mostly brought from the northern parts of England, and Ireland. The wool which these skins yield, as well as that of the beaver, is principally employed by hatters. The other species of fur are used as a part of the dress of females. The commerce which we carry on with North America in the article of fur alone is important. Some notion of its commencement, and progress, may be extracted from a valuable work, written by Sir Alexander Mackenzie, from which the following is a very brief extract.

"The fur trade, from the earliest settlement of Canada, was considered of the first importance to that colony. The country was then so populous, that, in the vicinity of the establishments, the animals whose skins were precious, in a commercial view, soon became scarce, if not altogether extinct. They were, it is true, hunted at former periods, but merely for food and clothing. The Indians, therefore, to procure the necessary supply, were encouraged to penetrate into the country, and were generally accompanied by some of the Canadians, who found means to induce the remotest tribes of natives to bring the skins which were most in demand to their settlements, in the way of trade.

"Those who thus accompanied the natives on their hunting and trading excursions, became so attached to the Indian mode of life, that they lost all relish for their former habits and native homes. Hence they derived the title of *Coueurs des bois*, became a kind of pedlars, and were extremely useful to the merchants engaged in the fur trade; who gave them the necessary credit to proceed on their commercial undertakings. Three or four of these people would join their stock, put their property into a birch-bark canoe, which they worked themselves, and either accompanied the natives in their excursions, or went at once to the country where they knew they were to hunt. At length, these voyages extended to twelve or fifteen months, when they returned with rich cargoes of furs, and followed by great numbers of the natives. During the short time requisite to settle their accounts with the merchants, and procure fresh credit, they generally contrived to squander away

all their gains, when they returned to renew their favourite mode of life.

"Indifference about amassing property, and the pleasure of living free from all restraint, soon brought on a licentiousness of manners which could not long escape the vigilant observation of the missionaries, who had much reason to complain of their being a disgrace to the Christian religion; by not only swerving from its duties themselves, but by thus bringing it into disrepute with those of the natives who had become converts to it; and, consequently, obstructing the great object to which those pious men had devoted their lives. They, therefore, exerted their influence to procure the suppression of these people, and, accordingly, no one was allowed to go up the country to traffic with the Indians, without a licence from the government.

"At first these permissions were, of course, granted only to those whose character was such as could give no alarm to the zeal of the missionaries: but they were afterwards bestowed as rewards for services on officers, and their widows; and they who were not willing or able to make use of them, were allowed to sell them to the merchants, who necessarily employed the *Coueurs des bois* in quality of their agents; and these people, as may be imagined, gave sufficient cause for the renewal of former complaints: so that the remedy proved, in fact, worse than the disease.

"At length, military posts were established at the confluence of the different large lakes of Canada, which, in a great measure, checked the evil; and now a number of able and respectable men, retired from the army, prosecuted the trade in person, under their respective licences, with great order and regularity, and extended it to such a distance, as, in those days, was considered to be an astonishing effort of commercial enterprise. These persons and the missionaries having combined their views at the same time, secured the respect of the natives, and the obedience of the people necessarily employed in the laborious parts of this undertaking. These gentlemen denominated themselves commanders, and not traders, though they were entitled to both those characters: and, as for the missionaries, if sufferings and hardships in the prosecution of the great work which they had undertaken, deserved applause and admiration, they had an undoubted claim to be admired and applauded; they spared no labour, and avoided no danger in the execution of their important office; and it is to be seriously lamented, that their pious endeavours did not meet with the success which they deserved: for there is hardly a trace to be found, beyond the cultivated parts, of their meritorious functions.

"At an early period of their intercourse with the savages, a custom was introduced of a very excellent tendency, but which was

soon unfortunately discontinued, of not selling any spirituous liquor to the natives. This admirable regulation was for some time observed, with all the respect due to the religion by which it is sanctioned, and whose severest censures followed the violation of it. A painful penance could alone restore the offender to the suspended rites of the sacrament. The casuistry of trade, however, discovered a way to gratify the Indians with their favourite cordial, without incurring the ecclesiastical penalties, by giving, instead of selling, it to them.

"Notwithstanding all the restrictions with which commerce was oppressed under the French government, the fur trade was extended to an immense distance, and surmounted many most discouraging difficulties, while, at the same time, no exertions were made from Hudson's Bay to obtain even a share of the trade of a country which, according to the charter of that company, belonged to it, and, from its proximity, is so much more accessible to the mercantile adventurer.

"Of these trading commanders, I understood, that two attempted to penetrate to the Pacific Ocean, but the utmost extent of their journey never was ascertained, owing, indeed, to a failure of the undertaking.

"For some time after the conquest of Canada, this trade was suspended, which must have been very advantageous to the Hudson's Bay Company, as all the inhabitants to the westward of Lake Superior, were obliged to go to them for such articles as their habitual use had rendered necessary. Some of the Canadians who had lived long with them, and were become attached to a savage life, accompanied them thither annually, till mercantile adventurers again appeared from their own country, after an interval of several years, owing, as I suppose, to an ignorance of the country in the conquerors, and their want of commercial confidence in the conquered. There were, indeed, other discouragements, such as the immense length of the journey necessary to reach the limits beyond which this commerce must begin; the risk of property; the expenses attending such a long transport; and an ignorance of the language of those who, from their experience, must be necessarily employed as the intermediate agents between them and the natives. But, notwithstanding these difficulties, the trade, by degrees, began to spread over the different parts to which it had been carried by the French, though at a great risk of the lives, as well as the property, of their new possessors, for the natives had been taught by their former allies to entertain hostile dispositions towards the English, from their having been in alliance with their natural enemies the Iroquois; and there were not wanting a sufficient number of discontented, disappointed people to keep alive such a

notion; so that for a long time they were considered and treated as objects of hostility.

"Hence it arose, that it was so late as the year 1766, before which the trade commenced from Michilimakinac. The first who attempted it were satisfied to go the length of the river Camenistiquia, about thirty miles to the eastward of the Grande Portage, where the French had a principal establishment, and was the line of their communication with the interior country. It was once destroyed by fire. Here they went and returned successful in the following spring to Michilimakinac. Their success induced them to renew their journey, and incited others to follow their example. Some of them remained at Camenistiquia, while others proceeded to and beyond the Grande Portage, which, since that time, has become the principal entrepôt of that trade, and is situated in a bay, in latitude 48° north, and longitude, 90° west. After passing the usual season there, they went back to Michilimakinac as before, and, encouraged by the trade, returned in increased numbers. One of these, Thomas Curry, with a spirit of enterprise superior to that of his cotemporaries, determined to penetrate to the furthest limits of the French discoveries in that country, or, at least, till the frost should stop him. For this purpose he procured guides and interpreters who were acquainted with the country, and with four canoes arrived at Fort Bourbon, which was one of their posts, at the west end of the Cedar Lake, on the waters of the Saskatchewan. His risk and toil were well recompensed, for he came back the following spring with his canoes filled with fine furs, with which he proceeded to Canada, and was satisfied never again to return to the Indian country.

"From this period people began to spread over every part of the country, particularly where the French had established settlements.

"A Mr. James Finlay was the first who followed Curry's example, and with the same number of canoes, arrived, in the course of the next season, at Nipawee, the last of the French settlements on the bank of the Saskatchewan river, in latitude nearly $43\frac{1}{2}^{\circ}$ north, and longitude 103° west: he met with good fortune, as he followed, in every respect, the example of his predecessor.

"As may be supposed, there were now people enough ready to replace them, and the trade was pursued with such avidity, and irregularity, that in a few years it became the reverse of what it ought to have been. An animated competition prevailed, and the contending parties carried the trade beyond the French limits, though with no benefit to themselves or neighbours: the Hudson's Bay Company, who, in the year 1774, and not till then, thought proper to move from home to the east bank of

Sturgeon Lake, in latitude $53^{\circ} 56'$ north, and longitude $102^{\circ} 15'$ west, became more jealous of their fellow subjects, and perhaps with more cause, than they had been with those of France.

" This competition gave a fatal blow to the trade from Canada, and, with other incidental causes, contributed to its ruin. This trade was carried on in a very distant country, out of the reach of legal restraint, and where there was a free scope given to any ways or means in attaining advantage. The consequence was not only the loss of commercial benefit to the persons engaged in it, but of the good opinion of the natives, and the respect of their men, who were inclined to follow their example. Thus did they waste their credit and their property with the natives, till the first was past redemption, and the last was nearly exhausted; so that towards the spring in each year, the rival parties found it absolutely necessary to join, and make one common stock of what remained, for the purpose of trading with the natives, who could entertain no respect for persons who had conducted themselves with so much irregularity and deceit. The winter, therefore, was one continued scene of disagreement and quarrels. To such a height had they carried this licentious conduct, that they were in a continual state of alarm, and were even frequently stopped to pay tribute on their route into the country; though they had adopted the plan of travelling together in parties of 30 or 40 canoes, and keeping their men armed; which sometimes, indeed, proved necessary for their defence.

" Thus was the trade carried on for several years, and consequently becoming worse and worse, so that the partners, who met them at the Grande Portage, naturally complained of their ill success. But specious reasons were always ready to prove that it arose from circumstances which they could not at that time controul; and encouragements were held forth to hope that a change would soon take place, which would make ample amends for past disappointments.

" It was about this time that Mr. Joseph Frobisher, one of the gentlemen engaged in the trade, determined to penetrate into the country yet unexplored, to the north and westward; and, in the spring of the year 1775, met the Indians from that quarter on their way to Fort Churchill, at Portage de Traite, so named from that circumstance on the banks of the Mississippi, or Churchill river, latitude $55^{\circ} 25'$ north, longitude $103\frac{1}{2}^{\circ}$ west. It was, indeed, with some difficulty that he could induce them to trade with him, but he at length procured as many furs as his canoes would carry. In this perilous expedition he sustained every kind of hardship incident to a journey through a wild and savage country, where his sub-

sistence depended on what the woods and the waters produced. These difficulties, nevertheless, did not discourage him from returning in the following year, when he was equally successful. He then sent his brother to explore the country still further west, who penetrated as far as the lake of Isle à la Croix, in latitude $55^{\circ} 26'$ north, and longitude 108° west.

" He, however, never after wintered among the Indians, though he retained a large interest in the trade, and a principal share in the direction of it till the year 1798, when he retired to enjoy the fruits of his labours.

" The success of this gentleman induced others to follow his example, and in the spring of the year 1778, some of the traders on the Saskatchewan river, finding they had a quantity of goods to spare, agreed to put them into a joint stock, and gave the charge and management of them to Mr. Peter Pond, who, in four canoes, was directed to enter the English river, so called by Mr. Frobisher, to follow his track, and proceed still further, if possible, to Athabasca, a country hitherto unknown but from Indian report. In this enterprise he at length succeeded, and pitched his tent on the banks of the Elk river, by him erroneously called the Athabasca river, about 30 miles from the Lake of the Hills, into which it empties itself.

" Here he passed the winter of 1778-9; saw a vast concourse of the Knisteneaux and Chepewyan tribes, who used to carry their furs annually to Churchill; the latter by the barren grounds, where they suffered innumerable hardships, and were sometimes even starved to death. The former followed the course of the lakes and rivers, through a country that abounded in animals, and where there was plenty of fish; but though they did not suffer from want of food, the intolerable fatigue of such a journey could not be easily repaid to an Indian: they were, therefore, highly gratified by seeing people come to their country to relieve them from such long, toilsome, and dangerous journeys; and were immediately reconciled to give an advanced price for the articles necessary to their comfort and convenience. Mr. Pond's reception and success was accordingly beyond his expectation; and he procured twice as many furs as his canoes would carry. They also supplied him with as much provision as he required during his residence among them, and sufficient for his homeward voyage. Such of the furs as he could not embark, he secured in one of his winter huts, and they were found the following season, in the same state in which he left them.

" These, however, were but partial advantages, and could not prevent the people of Canada from seeing the improper conduct of some of their associates, which rendered it dangerous to remain any longer

among the natives. Most of those who passed the winter at the Saskatchewan, got to the Eagle hills, where, in the spring of the year 1780, a few days previous to their intended departure, a large band of Indians being engaged in drinking about their houses, one of the traders, to ease himself of the troublesome importunities of a native, gave him a dose of laudanum in a glass of grog, which effectually prevented him from giving further trouble to any one, by setting him asleep for ever. This accident produced a fray, in which one of the traders, and several of the men, were killed, while the rest had no other means to save themselves but by a precipitate flight, abandoning a considerable quantity of goods, and near half the furs which they had collected during the winter and the spring.

"About the same time, two of the establishments on the Assiniboin river were attacked with less justice, when several white men, and a great number of Indians, were killed. In short, it appeared that the natives had formed a resolution to extirpate the traders; and nothing but the greatest calamity that could have befallen the natives, saved the traders from destruction: this was the small-pox, which spread its destructive and desolating power, as the fire consumes the dry grass of the field. The fatal infection spread around with a baneful rapidity which no flight could escape, and with a fatal effect that nothing could resist. It destroyed with its pestilential breath whole families and tribes; and the horrid scene presented to those who had the melancholy and afflicting opportunity of beholding it, a combination of the dead, the dying, and such as, to avoid the horrid fate of their friends around them, prepared to disappoint the plague of its prey, by terminating their own existence.

"The habits and lives of these devoted people, which provided not to-day for the wants of to-morrow, must have heightened the pains of such an affliction, by leaving them not only without remedy, but even without alleviation. Nought was left them but to submit in agony and despair.

"To aggravate the picture, if aggravation were possible, may be added the putrid carcasses which the wolves, with a furious voracity, dragged forth from the huts, or which were mangled within them by the dogs, whose hunger was satisfied with the disfigured remains of their masters. Nor was it uncommon for the father of a family, whom the infection had not reached, to call them around him, to represent the cruel sufferings and horrid fate of their relations, from the influence of some evil spirit, who was preparing to extirpate their race; and to excite them to baffle death, with all its horrors, by their own poniards. At the same time, if their hearts failed them in this necessary act, he was himself ready to perform the

deed of mercy with his own hand, as the last act of his affection, and instantly to follow them to the common place of rest and refuge from human evil.

"It was never satisfactorily ascertained by what means this malignant disorder was introduced, but it was generally supposed to be from the Missisquoi, by a war party.

"The consequence of this melancholy event to the traders was, that the means of disposing of their goods were cut off, and no furs were obtained but such as had been gathered from the habitations of the deceased Indians, which could not be very considerable. The only fortunate people consisted of a party who had again penetrated to the northward and westward in 1780, at some distance up the Mississippi, or English river, to Lake La Rouge.

"The country being thus depopulated, the traders and their friends from Canada, who, from various causes, already mentioned, were very much reduced in number, became confined to two parties, who began seriously to think of making permanent establishments on the Mississippi river, and at Athabasca; for which purpose, in 1781-2, they selected their best canoe-men, being ignorant that the small-pox penetrated that way. The most expeditious party got only in time to the Portage la Loche, or Mithy-Ouinigam Portage, which divides the waters of the Mississippi from those that fall into the Elk river, to dispatch one canoe strong-handed, and light loaded, to that country; but, on their arrival there, they found, in every direction, the ravages of the small-pox; so that, from the great diminution of the natives, they returned in the spring with no more than seven packages of beaver. The strong woods and mountainous countries afforded a refuge to those who fled from the contagion of the plains: but they were so alarmed at the surrounding destruction, that they avoided the traders, and were dispirited from hunting, except for their subsistence. The traders, however, who returned into the country in the year 1782-3, found the inhabitants in some sort of tranquillity, and more numerous than they had reason to expect, so that their success was proportionably better.

"During the winter of 1783-4, the merchants of Canada, engaged in this trade, formed a junction of interests, under the name of the North-West Company, and divided it into sixteen shares, without depositing any capital; each party furnishing a proportion or quota of such articles as were necessary to carry on the trade: the respective parties agreeing to satisfy the friends they had in the country, who were not provided for, according to this agreement, out of the proportions which they held. The management of the whole was accordingly entrusted to Messrs. Benjamin and Joseph Frobisher, and Mr. Simon

McTavish, two distinct houses who had the greatest interest and influence in the country, and for which they were to receive a stipulated commission in all transactions.

"In the spring, two of those gentlemen went to the Grande Portage with their credentials, which were confirmed and ratified.

"The traders in the country, and merchants at Montreal, thus entered into a co-partnership, which, by these means, was consolidated and directed by able men, who, from the powers with which they were intrusted, could carry on the trade to the utmost extent it would bear. The traders in the country, therefore, having every reason to expect that their past and future labours would be recompensed, forgot all their former animosities, and engaged with the utmost spirit and activity to forward the general interest; so that, in the following year, they met their agents at the Grande Portage, with their canoes laden with rich furs from the different parts of that immense tract of country. But this satisfaction was not enjoyed without interruption.

"However, this commercial establishment assumed, in 1787, a more solid basis than any hitherto known in the country; and it not only continued in full force, vigour, and prosperity, in spite of all interference from Canada, but maintained at least an equal share of advantage with the Hudson's Bay Company, notwithstanding the superiority of their local situation. The following account of this self-erected concern will manifest the cause of its success:

"It assumed the title of the North-West Company, but was no more than an association of commercial men, agreeing among themselves to carry on the fur trade, unconnected with any other business, though many of the parties engaged had extensive concerns altogether foreign to it. It may be said to have been supported entirely upon credit; for, whether the capital belonged to the proprietor, or was borrowed, it equally bore interest, for which the association was annually accountable. It consisted of twenty shares, equally divided among the persons concerned. Of these, a certain proportion was held by the people who managed the business in Canada, and were styled agents for the Company. Their duty was to import the necessary goods from England, store them at their own expense at Montreal, get them made up into the articles suited to the trade, pack and forward them, and supply the cash that might be wanting for the outfits: for which they received, independent of the profit on their shares, a commission on the amount of the accounts, which they were obliged to make out annually, and keep the adventure of each year distinct. Two of them went annually to the Grande Portage, to manage and transact the business there, and on the communica-

tion at Detroit, Michilimakinac, St. Mary's, and Montreal, where they received stores, packed up, and shipped the company's furs for England, on which they had also a small commission. The remaining shares were held by the proprietors, who were obliged to winter and manage the business of the concern with the Indians, and their respective clerks, &c. They were not supposed to be under any obligation to furnish capital, or even credit. If they obtained any capital by the trade, it was to remain in the hands of the agents; for which they were allowed interest. Some of them, from their long services and influence, held double shares, and were allowed to retire from the business at any period of the existing concern, with one of those shares, naming any young man in the company's service to succeed him in the other. Seniority and merit were, however, considered as affording a claim to the succession, which, nevertheless, could not be disposed of without the concurrence of the majority of the concern; who, at the same time, relieved the seceding person from any responsibility respecting the share that he had transferred, and accounted for it according to the annual value or rate of the property; so that the seller could have no advantage but that of getting the share of stock which he retained, realised, and receiving for the transferred share what was fairly determined to be the worth of it. The former was also discharged from all duty, and became a dormant partner. Thus, all the young men who were not provided for at the beginning of the contract, succeeded in succession to the character and advantages of partners. They entered into the company's service for five or seven years, under such expectations, and their reasonable prospects were seldom disappointed: there were, indeed, instances when they succeeded to shares before their apprenticeship was expired, and it frequently happened that they were provided for while they were in a state of articulated clerkship. Shares were transferrable only to the concern at large, as no person could be admitted as a partner who had not served his time to the trade. The dormant partner, indeed, might dispose of his interest to any one he chose, but if the transaction were not acknowledged by his associates, the purchaser could only be considered as his agent or attorney. Every share had a vote, and two-thirds formed a majority. This regular and equitable mode of providing for the clerks of the company, excited a spirit of emulation in the discharge of their various duties, and, in fact, made every agent a principal, who perceived his own prosperity to be immediately connected with that of his employers. Indeed, without such a spirit, such a trade could not have become so extended and advantageous as it has since been.

"In 1788, the gross amount of the adventure for the year did not exceed 40,000*l.* but by the exertion, enterprise, and industry of the proprietors, it was brought in eleven years to triple that amount and upwards; yielding proportionate profits, and surpassing, in short, any thing known in America.

"Such, therefore, being the prosperous state of the company, it very [naturally] tempted others to interfere with the concern in a manner by no means beneficial to the company, and commonly ruinous to the undertakers.

"In 1798 the concern underwent a new form, the shares were increased to forty-six, new partners being admitted, and others retiring."

A recent traveller through this region of America (F. Hall, 1817), thus writes respecting Montreal:—"Besides being still the emporium of the fur trade, its merchants carry on a great traffic with the United States. The fur-traders, or *North-Westerns*, as they are familiarly called, take the lead in society: they give the best entertainments, and their ladies take the lead in fashions."

In another place the same author says, "The North West Company drive a gainful traffic with the Indians in the neighbourhood of Milbay, the last settlement on the north bank of the river St. Lawrence; for they buy their furs at a shilling a piece, and sell them such commodities as custom has rendered necessities at their own price; no pains, nor even violence, being spared to prevent any competition likely to diminish their profits."

"It will not be superfluous (proceeds Mr. Mackenzie), in this place, to explain the general mode of carrying on the fur trade.

"The agents are obliged to order the necessary goods from England in the month of October, eighteen months before they can leave Montreal; that is, they are not shipped from London until the spring following, when they arrive in Canada in the summer. In the course of the following winter they are made up into such articles as are required for the savages; they are then packed into parcels of 90 lbs. weight each, but cannot be sent from Montreal until the May following: so that they do not get to market until the ensuing winter, when they are exchanged for furs, which come to Montreal the next fall, and thence are shipped, chiefly to London, where they are not sold or paid for before the succeeding spring, or even as late as June; which is 42 months after the goods were ordered in Canada, 36 after they had been shipped from England, and 24 after they had been forwarded from Montreal; so that the merchant, allowing that he has twelve months' credit, does not receive a return to pay for those goods, and the necessary expenses attending them, which is about equal to the

value of the goods themselves, till two years after they are considered as cash, which makes this a very heavy business. There is even a small proportion of it that requires twelve months longer to bring round the payment, owing to the immense distance it is carried, and from the shortness of the seasons, which prevents the furs, even after they are collected, from coming out of the country for that period.

"This will be better illustrated by the following statement: we will suppose the goods for 1798;

"The orders for the goods	are sent to this country	25th Oct. 1796.
They are shipped from	London	March 1797.
They arrive in Montreal		June 1797.
They are made up in the	course of that summer	
and winter.		
They are sent from Mon-	treal	May 1798.
They arrive in the Indian	country, and are ex-	
changed for furs the	following winter	1798-9.
Which furs come to Mon-	treal	Sept. 1799.
And are shipped for Lon-	don, where they are	
sold in March and	April, and paid for in	
May or June		1800.

"The articles necessary for this trade are coarse woollen cloths of different kinds; milled blankets of different sizes; arms and ammunition; twist and carrot tobacco; Manchester goods; linens and coarse sheetings; thread, lines, and twine; common hardware; cutlery and ironmongery of several descriptions; kettles of brass and copper, and sheet-iron; silk and cotton handkerchiefs; hats, shoes, and hose; calicoes and printed cottons, &c. &c. &c. Spirituous liquors and provisions are purchased in Canada. These, and the expense of transport to, and from, the Indian country, including wages to clerks, interpreters, guides, and canoe-men, with the expense of making up the goods for the market, form about half the annual amount against the adventure.

"This expenditure in Canada ultimately tends to the encouragement of British manufacture; for those who are employed in the different branches of this business, are enabled by their gains to purchase such British articles as they must otherwise forego.

"The produce of the year of which I am now speaking, consisted of the following furs and peltries:

106,000 Beaver skins,
2,100 Bear skins,
1,500 Fox skins,

4,000 Kitt Fox skins,
 4,600 Otter skins,
 17,000 Musquash skins,
 32,000 Marten skins,
 500 Buffalo robes, and a quantity of
 castorum,
 1,800 Mink skins,
 6,000 Lynx skins,
 600 Wolverine skins,
 1,650 Fisher skins,
 100 Raccoon skins,
 3,800 Wolf skins,
 700 Elk skins,
 750 Deer skins,
 1,200 Deer skins, dressed.

"Of these were diverted from the British market, being sent through the United States to China, 15,364 skins, fine beaver, weighing 19,283 pounds. 1,250 fine otters, and 1,724 kitt foxes. They would have found their way to the China market at any rate, but this deviation from the British channel arose from the following circumstance:

"An adventure of this kind was undertaken by a respectable house in London, half concerned with the North-West Company in the year 1792. The furs were of the best kind, and suitable to the market; and the adventurers continued this connection for five successive years, to the annual amount of 40,000*l*. At the winding up of the concern of 1792, 1793, 1794, 1795, in the year 1797, (the adventure of 1796 not being included, as the furs were not sent to China, but disposed of at London), the North-West Company experienced a loss of upwards of 40,000*l*. (their half), which was principally owing to the difficulty of getting home the produce procured in return for the furs from China, in the East India Company's ships, together with the duty payable, and the various restrictions of that company. Whereas, from America there are no impediments; they get immediately to market, and the produce of them is brought back, and perhaps sold in the course of twelve months. From such advantages the furs of Canada will no doubt find their way to China by America."

Since the time when Mr. Mackenzie wrote, this North-West Company has, as it were, absorbed some inferior, but rival, establishments in other parts of America, and the United Companies carry on a more extensive traffic in conjunction, and with more general advantage than they could have done separately. The fur trade has been recently regulated, and a criminal and civil jurisdiction has been established in certain parts of North America, by stat. 1 and 2 Geo. 4. c. 66.

FURLING, in the sea-language, signifies the wrapping up and binding any sail close to the yard; which is done by hawling upon the clew-lines, bunt-lines, &c. which wraps the sail close together, and being found fast to the yard, the sail is furled.

FURLONG, a long measure, equal to $\frac{1}{8}$ of a mile, or 40 poles. In some law-books it is used for the eighth part of an acre.

FURNACE, an utensil to raise and maintain a vehement fire in, whether of coal or wood. Furnaces are used in almost every branch of manufacture, and are principally made at Birmingham, and Sheffield. The materials of which furnaces are constructed ought to be sufficiently proof against the degree of heat to which they are intended to be exposed. Commonly they are built of bricks made of sand and clay, or of cast iron, or of iron-plates, which, the better to be defended against the fire, are coated in the inside to the thickness of an inch with Windsor loam. It has been recently discovered that heat is best retained within any receptacle of ignited fuel, by the introduction of powdered charcoal, from one, to three or four inches in thickness, between an inner, and outer, case or *crust* of brick-work, in which the furnace is supposed to be placed. The burning of the fuel is kept up in the furnace either by a natural current of air, which is caused by the fire itself, and such a furnace is called an air-wind furnace; or it is done by compressed air, conveyed to the furnace by a large bellows, as in blast furnaces.

FURNACES, *Hatters'*, are of three kinds; a small one under the basin, where the wool-makers basin their hats; a larger in the lanking room, under a little copper full of lees and vitriol liquor, where the hats are worked; and a very large one under the great copper, wherein they dye their hats.

FURNACE, *Glass Painters'*, is made of brick, nearly square, and about $2\frac{1}{2}$ feet each way. It is cut horizontally in the middle by a grate, which sustains the pan or shovel the glass is baked in. This furnace has two apertures, one below the grate to put the fuel in at; the other above it, through which the workman spies how the action of the colours goes on.

FURNACE, *Glasshouse*, the place where the ingredients or materials of glass are fused or vitrified.

There are three kinds of furnaces used in the glass-works, viz. the first called the *calcar*, serves to prepare or calcine the *frit* in it. This is made in the fashion of an oven, ten feet long, seven broad, and two deep.

The fuel, which is sea-coal, is put into a trench on one side of the *furnace*, and the flame reverberates from the roof back upon the *frit*. The coals burn in an iron grate, from whence the ashes fall into a hole underneath.

The second is the *working furnace*, in which the metal is melted, or the glass made. The figure of this is round, three yards in diameter and two high, being arched over; round the inside eight or more pots are placed, and piling pots upon these: the number of pots is always double that of the

boccas or mouths, or that of the workmen, that each may have one pot refined to work out of, and another for metal to refine in, while he works out of the former.

The furnace has two partitions; the lower, separating the pots from the fire-place, has a circular hole in the centre, covered with a grate, through which the flame passes, from the fire-place into the furnace; from the arched sides and roof whereof it is reverberated into the melting pots.

The second partition divides this from the *leer* or annealing furnace; through the *boccas*, or working-holes, the metal taken out of the pots is put into the furnace: these *boccas* are stopped with moveable covers, made of lute and brick, to screen the eyes of the workmen from the fire: in each side of the *bocca* is a *boccarella*, out of which coloured glass, or the finer metal is taken from the piling-pot.

To the furnace are also attached ovens or holes, near the *leer*, for the calcining of tartar, iron, &c.

The *leer*, which consists of a tower, and placed directly over the melting furnace, is employed in annealing and cooling the glass.

FURRIER. The furrier cures, dyes, and makes up several kinds of furs or skins, with the hair on, into muffs, tippets, the lining of robes, &c. He dyes cat-skins, and those of rabbits, so as to imitate the richest and most valuable furs.

FUSTET, (It. *Scotano*. LAT. *Cotinus*

coriaria.) the wood of the, yields a fine orange colour, but not at all durable. It is used by the French dyers, but not much in this country, with other colouring substances, particularly cochineal, to modify or heighten their effects, and in this way it is more permanent.

FUSTIAN, (GER. *Barchent*. DU. *Fustein*. DA. *Olmerdug*, *Parkken*. SW. *Parkum*. FR. *Futaine*. IT. *Fustagno*, *Frustagno*. SP. *Fustan*. PORT. *Fustao*. RUS. *Bumasea*. POL. *Barchan*.) a kind of cotton stuff, which seems as if it was whaled or ribbed on one side; the principal manufacture of this article is carried on at Manchester, and in its neighbourhood. Deceits in the manufacture of fustian prohibited, 11 Hen. 7. c. 27.

FUSTIC, (GER. *Gelbholz*, *Fustick*. DU. *Geelhout*. DA. *Guulholt*. SW. *Gelbholtz*. FR. *Bois jaune de Bresil*. IT. *Legno giallo de Brasilio*. SP. *Palo del Brasilamarillo*.) a yellow wood, used in dyeing, principally in the islands of Barbadoes, Tobago, &c. The colour it yields is a fine golden yellow. See DYEING.

FUTOCKS, in a ship, the timbers raised over the keel, or the encompassing timbers that make her breadth; of these are first, second, third, and fourth, denominated according to their distance from the keel, those next it being called first or ground futtocks, and the others upper futtocks; those timbers, being put together, make a framebend.

GAG

G, The seventh letter of our alphabet, as a numeral was anciently used to denote 400; and with a dash over it, thus, *G̃*, 40,000.

GABEL, **GAVEL,** or **GABELLE,** was formerly a duty on salt in France, which brought in a very considerable revenue to the king, amounting to almost the one-fourth of the whole duties. It is also a word met with in old records, signifying a tax, rent, custom, or service, paid to the king or other lord.

GAD, among miners, a small punch of iron, with a long wooden handle, used to break up the ore. One of the miners holds this in his hand, directing the point to a proper place, while the other drives it into the vein, by striking it with a sledge-hammer.

GAFFLES, artificial spurs made of steel, or iron, and put on game-cocks. They are chiefly manufactured at Birmingham and Sheffield, &c.

GAGE, or **GAUGE,** in the sea language. When one ship is to windward of

GAL

another, she is said to have the weather-gage of her. They likewise call the number of feet that a vessel sinks in the water, the ship's gage: this they find by driving a nail into a pike near the end, and putting down beside the rudder till the nail catches hold under it; then as many feet as the pike is under water, is the ship's gage.

GAGE, among letter-founders, a piece of box, or other hard wood, variously notched, the use of which is to adjust the dimensions, slopes, &c. of the different sorts of letters. There are several kinds of these gages, as the *flat-gage*, the *face-gage*, the *italic-gage*, &c.

GALANGAL, (GER. *Galgant*. DU. *Galinga*. DA. *Galange*. SW. *Galgarot*. FR. IT. SP. and PORT. *Galanga*. RUS. *Kalgan*. POL. *Galgan*, *Kalkan*. LAT. *Galanga*.) is brought to us from China, and of it there are two sorts, the greater and the less. The greater galangal is a knotty root, with several circles on the surface, of a reddish-brown colour on the outside, and a

yellowish-white within, which greatly resembles ginger in its smell, taste, and chemical composition. It is the root of the *Kempferia Galanga*. The lesser, which is most esteemed, is a knotty, jointy root, about an inch long, and about half an inch thick, of a brownish-red coat, pale red colour within, having several circular rings on the outside, of a hot, bitterish, aromatic, biting taste, like pepper, and a fragrant smell. It is used in the East Indies as a spice for seasoning many sorts of dishes. With us it is used as a stomachic, and is made an ingredient in almost all bitter infusions and tinctures.

GALBANUM, a gum issuing from the stem of an umbelliferous plant, growing in Persia and many parts of Africa. It is sometimes met with in the shops in loose granules, called drops and tears, and sometimes in large masses, formed of a number of these blended together; but in these masses some accidental foulness is often mixed with the gum. The single drops usually approach to a roundish, oblong, pear-like form. Galbanum is soft like wax, and, when fresh drawn, white; but it afterwards becomes yellowish, or reddish: it is of a strong smell, of an acid, bitterish taste; it is inflammable in the manner of resin, and soluble in water like gum. It attenuates tough phlegm, and is of service in asthmas and inveterate coughs: also in hysteric complaints.

GALEASSE, a large low-built Venetian vessel, using both sails and oars, and the largest of all the vessels that make use of the latter. It may carry 20 guns, and has a stern capable of lodging a great number of marines. It has three masts, which are never to be lowered or taken down. It has also 32 benches of rowers, and to each bench six or seven slaves, who sit under cover.

GALLEON, a sort of ship, employed in Spain in the commerce of the West Indies. See *title* EUROPE, article SPAIN.

GALLERY, in a ship, that beautiful frame, which is made in the form of a balcony, at the stern of a ship without board; into which there is a passage out of the admiral's or captain's cabin, and is for the ornament of the ship.

GALLEY, a low-built vessel using both sails and oars, and usually carrying only a main-mast and fore-mast, which may be struck or lowered at pleasure. Gallies are chiefly used in the Mediterranean.

GALLO, a silver coin of the kingdom of Cambay, in the East Indies, weighing one mace, five condorins Chinese.

GALLON, a measure of capacity, both for dry and liquid articles, containing four quarts; but these quarts, and consequently the gallon itself, are different, according to the quality of the thing measured. The wine gallon contains 231 cubic inches, and holds eight pounds, five ounces, and two-thirds avoirdupois, of pure water: the beer and ale

gallon contains 282 solid inches, and holds ten pounds, three ounces and a quarter avoirdupois, of water; and the gallon of corn, meal, &c. 268 4-5ths cubic inches, and holds nine pounds, eleven ounces and a half of pure water. It is also a weight, as 12lb. of honey at the Custom-house; 7½lb. of train-oil; and in the coal-trade at Newcastle, coals are sold by a weight denominated a gallon.

GALLOON, (GER. and DU. *Galoonen*. DA. and SW. *Galon*. FR. *Galons*. IT. *Galoni*. SP. *Galones*. PORT. *Galoes*. RUS. *Galuni*;) a narrow thick kind of ferret or lace, used to edge or border cloths, sometimes made of wool or thread, and at others of gold or silver, but commonly of mohair or silk. It is mostly used for binding hats, and other parts of wearing apparel; there are two kinds used for binding hats, the coarsest is principally made at Spitalfields, the finer at Coventry; there is also a large manufactory for it at Reading in Berks.

GALLS, (GER. *Gallnöpfel*, Gallus. DU. *Gallnooten*. DA. *Galdæbler*. SW. *Galläpplen*. FR. *Galles*, *Noix de galle*. IT. *Galle*, *Galluze*. SP. *Agallas*. PORT. *Galias* *Bugalhos*. RUS. *Tschernnünü* or *Teschki*. POL. *Galas*. LAT. *Gallæ*;) are tumours, produced by the punctures of insects on several species of the oak-tree. Other trees are liable to the same accidents, and produce galls of various forms and sizes, but those of the oak only are used in medicine, and for the purposes of dyeing and making ink. There are two sorts of galls, viz. Oriental and European; the former sort comes to us from Aleppo: they are of the size of a large nutmeg, not of its oblong figure, but round, and have usually a considerable number of tubercles rising on their surface, broad at the base, and terminating in a point; they are of a very solid and firm texture, hard to break, very heavy, and of a whitish and pale brown, and blueish, and sometimes of a blackish colour; when broken, they are somewhat of a paler colour than on the surface, and are of a dense and compact texture, resinous, and of an acerb and very astringent taste.

The European galls, as those of France and Italy, are rounder than those of Aleppo, of the same size, and have perfectly smooth surfaces, without any protuberances; they are of a pale whitish or brownish colour, very light, easily broken, and often spongy and cavernous within; they are of a much less austere taste, and of much less value, both in manufactures and medicine. Galls put in small quantity, into a solution of vitriol in water, though but a very weak one, give it a purple or violet colour, which, as it grows stronger, becomes black, and on this depends our writing-ink, as also a great deal of the art of dyeing, staining leather, and many other of the manufactures. See DYEING and INK.

GAMBOGE, (GER. DA. & RUS. *Gum-migutt*. DU. *Gutte gom*, *Gutta gamba*, *Gütte gom*. SW. *Gummigutta*. FR. *Gomme gutte*. IT. *Gomma gutta*. SP. *Gomma guta*, *Guta gamba*. PORT. *Gomma rom*, *Gomma guta*, *Gutta gamba*. POL. *Gummi-gotta*. LAT. *Gummi gutta*, *Gutta gamba*, *Cambogia*.) see **GUM**, a gum-resin, brought to us in the form of orbicular masses, or of cylindrical rolls of various sizes, and is of a dense, compact, and firm texture, and of a beautiful yellow. It is chiefly brought from Cambodia and Cambogia; and thence it has obtained its names of cambadium, cambogium, and gambogium. The best sort is of a deep yellow or orange colour, breaks shining, and is free from dross; it has no smell, and very little taste, unless kept in the mouth for some time, when it impresses a slight sense of acrimony. It is used in medicine as a strong purgative, but its principal use is as a pigment in water colours, though it does not stand.

GAME, is a species of property difficult to be defined; because, first, it has not been defined by those very laws which have been made for its protection; and, secondly, because different notions are holden respecting it in different countries where it is the subject of exclusive possession. In this country, colloquially at least, the term "Game" is now understood to comprehend only deer, hares, pheasants, partridges, moor, and heath fowl, or grouse. All these descriptions of game, (as well as some other animals, which by some other statutes are treated in a similar light,) are protected by a much greater number of laws than it is necessary to notice here; but as a subject of traffic, it is expedient to mention those particular statutes which prohibit the buying and selling, as well as the mere having the possession of game, by any persons not possessing a certain special qualification. The most modern, as well as the most comprehensive statute on this subject, was the 9th Anne, c. 25, which subjected all persons (*not being qualified*) from selling, or even having in their possession, any game, unless presented to such persons by another who was qualified, to the penalty of 5*l.* per head of game. The 58 Geo. 3. c. 75, makes it unlawful for *any* person, even qualified, to *buy* any game, under a similar penalty of 5*l.* per head. The design of these statutes is obviously, even if it had not been declared to be, for the preservation of the game of this kingdom, but there are no words of exception in them as to game imported from other countries. Of late, however, no inconsiderable quantity of game has been brought in the winter months from abroad, especially of the grouse or heath-fowl kind, from Norway.

GAMING.—Every species of gaming is punishable by the laws of England, in some manner, and in some degree, which it is

possible for municipal regulations to reach. Public gaming-houses are prohibited, under severe penalties, by several statutes, especially 33 Hen. 8. c. 9. and 25 Geo. 2. c. 36; and persons gaming in the same are not only made liable to imprisonment, on conviction before justices, by the former of these, extended by 2 Geo. 2. c. 28. 18 Geo. 2. c. 34; but to pecuniary penalties by the latter, as also under certain circumstances, by civil process, by 9 Ann. c. 14.—1 *Dick. Pract. Expos.* 626.

Races, and bets laid on them, have been repeatedly decided to be within these statutes against gaming, at least so far as their illegality, and the recovery of penalties by civil process. 4 *Term R.* 1.

Wagers, or bets on the fate of public characters, have a mischievous tendency, and have been determined to be illegal. *B. R. Gilbert v. Sykes*, T. T. 52 Geo. 3.

So, wagers, in which none but the parties laying them can have any interest, and which at the same time have a tendency to a breach of the peace, or even to the restraint or inconvenience of a third person. *B. R. Elthorn v. Kingsman*, T. T. 57 Geo. 3.

Gambling policies or insurances, in which the party insured has no interest, are made void by 19 Geo. 2. c. 37. and 14 Geo. 3. c. 48. 2 *Black. Com. Archbold Edit.* 460.

GAMMONING, among seamen, denotes several turns of a rope taken round the bowsprit, and reeved through holes in the knees of the head, for the greater security of the bowsprit.

GANG, in the sea language, the same with the crew. The company with which a ship's boat is manned is called the cockswain's crew or gang.

GANG-WAY, denotes any of the several passages or ways from one part of the ship to the other: and whatever is laid in these passages is said to lie in the gang-way.

GANTAN, a weight used at Bantam in the isle of Java, and in other parts of the East Indies, equal to three Dutch pounds: it is also a measure for pepper, containing exactly three pounds.

GANZAS, or **GAUZAS**, are a species of money made of copper and pewter, by private persons in the kingdom of Pegu, and not in the royal mints. They are of no fixed value, but rise and fall, according to the times of payment for the goods of the country. They are commonly worth from two to three French sous, or from one penny to three halfpence sterling.

GARBLE, the dust, dross, and refuse of spices and drugs.

GARBLED. Drugs, dye-stuffs, &c. are said to be *garbled*, when they are reduced to small, broken fragments.

GARBLER of spices, (mentioned in stat. 21 Jac. c. 12,) is an officer of great antiquity in the city of London, who may enter into any shop, warehouse, &c. to view and

search drugs, spices, &c. and to garble the same and make them clean.

GARBLING, is the picking out the worst of any commodity.

GARBOARD-STRAKE, the plank next the keel of a ship, one edge of which is run into the rabbit made in the upper edge of the keel on each side.

GARI, an imaginary specie, or rather the denomination of a sum, used in many parts of the East Indies, and particularly in the late dominions of the great Mogul: one gari of rupees is worth near 4000 rupees.

GARNET, (GER. *Granaten*, *Granatsteine*. DU. *Granaaten*. DA. and SW. *Granater*. FR. *Grenats*. IT. *Granati*. SP. *Granadas*. PORT. *Granadas*, *Granates*. RUS. *Granatnoi kamen*. POL. *Granatki*. LAT. *Granati*.) a very beautiful gem of a red colour, with an admixture of blue. When pure and free from blemishes, it is little inferior, in appearance, to the oriental ruby, though only of a middle degree of hardness between the sapphire and common crystal. It is found of various sizes, from that of a pin's head, to an inch in diameter. Among our lapidaries and jewellers, genuine garnets are known by different names, according to their different degrees of colour. 1. The garnet, simply so called, is the finest and most valuable kind, being of a very deep blood-red, with a faint admixture of blue. 2. The rock-ruby, a name very improperly given to the garnet, when it is of a very strong but not deep red, and has a fairer cast of the blue; this is a very beautiful gem. 3. The sorane or serain garnet, that of a yet brighter red, approaching to the colour of native cinnabar, with a faint blue tinge. 4. The almandine, a garnet only a little paler than that called the rock-ruby. Garnets are divided into the oriental or Asiatic, and occidental or European kinds. The first are principally brought from Calicut, Cananor, and Cambay; and the second are common in Italy, Hungary, and Bohemia. They are also occasionally found in the North of Scotland. Some authors have supposed the deeper-coloured garnet to be the same with the carbuncle of the ancients, from which it really differs; since in receiving the sun's beams, it never gives so true a fire-colour as the carbuncle.

GARNET, in a ship, is a tackle having a pendant coming down from the mainmast, with a block well seized to the mainstay, just over the hatchway, to which a guy is fixed to keep it steady; and at the other end is a long tackle-block, in which the fall is reeved, that so by it any goods or casks may be hauled or hoisted into or out of the ship. When this garnet is not used, it is fastened along the stay.

GARNISH, in law-books, signifies to warn; in which sense, to garnish the heir is mentioned in stat. 27 Eliz. c. 3.

GARNISHEE, is used for the third person or party in whose hands money is attached within the limits of the city of London, in the Sheriff's or Mayor's court there; and he is so called, because he has had garnishment or warning not to pay the money, but to appear and answer to the plaintiff-creditor's suit. See **ATTACHMENT**.

GARNISHMENT, is a warning given to a person for his appearance, for the better furnishing the court with parties sufficient to determine the cause. See **ATTACHMENT**.

GAS, among chemists, a term made use of to denote all the aerial and permanently elastic fluids, except the atmospheric air.

GAS-LIGHT. Common pit-coal, when exposed to a certain degree of heat, becomes decomposed; it gives out in the first instance an inflammable gas, consisting of carbon and hydrogen, called *carburetted hydrogen gas*, and sometimes *heavy inflammable air*; it is this which has lately been applied to the furnishing of light in the place of oil, &c. Besides carburetted hydrogen, the gas from coal also contains a proportion of sulphur and carbonic acid. The latter may be separated by merely passing it through lime-water; but to purify it completely from the sulphuretted hydrogen, (which imparts to it the disagreeable smell, and causes that oppression of the breathing complained of by some persons in places in which it is distributed,) it should be first combined with ammoniacal gas, which, uniting with the sulphuretted hydrogen, renders it soluble in water. The ammoniacal gas for this purpose, may be obtained from a mixture of coal and lime, exposed to heat in a retort.

The gas, when purified, is conveyed to a vessel, called the gasometer, where it is subjected to a slight degree of pressure, (about equal to that of a column of water one inch in height,) which, from its being lighter than common air, readily propels it through pipes, to those places to which it is desired to be transmitted.

Carburetted hydrogen gas, when mixed with seven or eight times its bulk of atmospheric air, explodes with violence on the contact of flame; but this mixture can hardly occur if the slightest attention be paid to the gasometer. An accident of this kind that happened a few months since, was owing to the escape of gas from an over-charged gasometer into the gasometer-house, where it was set on fire by a candle. The metal the best adapted for forming the pipes for conveying the gas, is iron.

One hundred and twelve pounds of cannel coal produce, at a *minimum*, from 350 to 360 cubic feet of carburetted hydrogen. Half a cubic foot of this gas is equal to, in illuminating power, from 170 to 180 grains of tallow, which is the average quan-

city consumed per hour, by a tallow candle of six to the pound. Some attention is necessary to be paid to the degree of heat applied to the distillatory apparatus. When a low red heat is employed, the gas produced admits a feeble light; when an intense white heat, it burns with a clear blue flame with little illumination.

Besides the gas immediately produced, the coal also furnishes tar in the proportion of 12 gallons to a chaldron of coals, which may be resolved almost wholly into gas fit for illumination, by passing it through a red-hot tube. The other products of coal are coke, and an ammoniacal liquor, in the proportion of 18 gallons to a chaldron of coals.

GAS, purifying. A patent has recently been obtained by a Mr. Phillips, of Exeter, for the operation of purifying gas for the purposes of illumination. This gentleman's recipe prescribes any quantity of well-burnt lime to be taken, on which is to be poured water till the lime falls to powder. A further quantity of powder is then to be mixed with it, in order to bring it into that state that the particles of lime may only adhere slightly to each other, but not to such a degree as to prevent the free passage of air between them. This mixture must be placed six inches deep, more or less, on moveable perforated shelves in a vessel, the top of which is to be guarded by a water joint, and underneath a pipe to allow the passage of the gas that way, so that the gas may pass from the bottom of the vessel to the top, through the perforated shelves and lime mixture, or from the top to the bottom, as may be found most convenient, the purification being effected by the gas being caused to pass through the layers of lime mixture; but where the quantity of gas to be purified is very large, he arranges a set of these vessels, consisting of numbers in proportion to the size of the gas work, each vessel containing one, or more, shelves. Those vessels are to be placed in any way which convenience may require, and, being without bottoms, stand in a cistern of water or other fluid, about six inches deep, so that the gas cannot pass that way. The system adopted by Messrs. Taylor and Martineau, of London, for lighting houses and streets with purified oil gas, is very successful.

GAUGER, a king's officer, who is appointed to examine all tuns, pipes, hogsheds, and barrels of wine, beer, ale, oil, honey, &c. and give them a mark of allowance, before they are sold in any place within the extent of his office. There are divers statutes that mention this officer and his office: as by 27 Edw. 3. c. 8. all wines, &c. imported are to be gauged by the king's gaugers, or their deputies, otherwise they shall be forfeited, or their value; and on default of the gauger, that he is not ready

to do his office when required, or that he defrauds in doing it to the damage of the buyer or seller, he shall pay the party grieved his treble damage, lose his office, be punished by imprisonment, and be ransomed only at the king's will; and in case less is found in the tun or pipe than ought to be, the value as much as shall lack shall be deducted in the payments.

Every gauger shall truly, within the limits of his office, gauge all tuns, butts, pipes, tierces, puncheons, tercies, hogsheds, barrels, and rundlets; and mark on the head of every vessel the contents, upon pain of forfeiting to the party to whose use the wine, &c. shall be sold, four times the value of that which the vessel marked shall lack of its content: the same forfeiture shall be recovered by an original writ, &c. and every person selling the wine, &c. in the vessel marked, shall allow of the price, the value of gauge, or default of filling, upon pain of forfeiture to the buyer, of double the value, to be recovered with costs as before. No brewer shall put to sale any beer or ale in vessels brought from beyond the sea, within the city of London, or suburbs of the same, or within two miles compass without the suburbs, before the same is gauged, and the true content of every such vessel set upon the same, by the gallon appointed for beer and ale, according to the standard by the master and wardens of the coopers of London. Gaugers may take samples not exceeding half a pint, by stat. 32 Geo. 2. c. 29.

GAWZE, or **GAWSE**, (GER. DU. *Da. Sw. and Fr. Gaze. It. Velo. Sp. Gasa. Port. Garça. Rus. Gasa. Pol. Gaza*.) a very slight, thin, open kind of stuff, made of silk, sometimes of thread; there are also figured gawzes, and some with gold or silver flowers on a silk ground, the latter comes to us principally from China.

In preparing silk for making gawze, it is turned round a wooden machine about six feet in height, in the middle of which the axis is placed perpendicularly, with six large wings. On these the silk is wound off in bobbins by the revolution of the axis; and when it is thus placed round the mill, it is taken off by means of another instrument, and wound on two beams. The silk is then passed through as many small beads as it has threads, and is thus rolled on another beam, in order to supply the loom.

Within these few years excellent silk and other gawzes have been manufactured at Paisley in Scotland.

GAZANA, or **GASAVA**, a silver coin, and one of the rupees current in the Great Mogul's late territories, particularly at Amadabath, worth $1\frac{1}{2}$ livre Tournois, or 15d. sterling.

GAZE, a small copper money current in Persia, worth about two French liards, or one farthing sterling.

GE, or JE, an imaginary long measure in some parts of the East, equal to about $34\frac{1}{2}$ Dutch aunes, or ells.

GEDER, a measure of capacity, used by the Indians for their grain: it contains near four pounds avoirdupois weight of pepper.

GEM, (*Gems*. GER. *Edelsteine*. DU. *Edele steenen*. DA. *Edelstene*. SW. *Adle stenar*. FR. *Pierres précieuses*. IT. *Pietre preziose*. SP. *Piedras preciosas*. PORT. *Pedras preciosas*. RUS. *Dorogia kamenja*. POL. *Drogié kamienie*. LAT. *Lapides pretiosi*, *Gemmae*), a common name for all precious stones; as the diamond, ruby, sapphire, emerald, turquoise, opal, agate, crystal, &c.

GENEVA, or GIN, (GER. *Gäud*. DU. *Genever*. FR. *Genevrette*. IT. *Acqua di Ginepro*. SP. *Agua de Enebro*. PORT. *Agua de Zimbro*. LAT. *Juniperi aqua*), an ordinary malt spirit, distilled a second time, with the addition of juniper berries. Holland is noted for distilling the finest geneva; vast quantities of which are annually imported into Great Britain. Our geneva, or, as it is usually denominated, *gin*, is an imitation of the Dutch spirit, to which it is greatly inferior in quality, although it is considered, when unadulterated with noxious mixtures, to be equally as wholesome as the latter. There is a celebrated manufactory of it at Maidstone, in Kent, where it has lately been made so good as in a considerable degree to have superseded the importation of Holland geneva. The best is said to be made by distilling a second time Scotch whiskey with the addition of juniper berries; but for the ordinary sort, oil of turpentine is substituted in the manufactory instead of the juniper. See DISTILLATION.

GENTIAN, (GER. *Enzian*. DU. *Gentian*. DA. *Entian*, *Südrod*. SW. *Bagsöta*. FR. *Gentiane*. IT. *Genziana*. SP. *Jenciana*. PORT. *Genciana*. RUS. *Enzian*. POL. *Goryczka*. LAT. *Gentiana*), is a native of the mountainous parts of Germany, and is found in abundance in Burgundy, the Pyrenees, and the Alps, whence the roots, the only part used in medicine, are brought to this country. They have a yellowish-brown colour, and a very bitter taste, and are very frequently used in medicine as stomachic biters. In taste they are less exceptionable than most of the substances of this class. Infusions of gentian-root flavoured with orange-peel, are sufficiently grateful. Some years ago a poisonous root was discovered among the gentian brought to London, the use of which occasioned violent disorders, and in some cases death. This root is easily distinguished from the gentian, by its being internally of a white colour, and void of bitterness.

GBERKIN, or GIRKIN, (*Pickled girkins*. GER. *Essiggürkchen*. DU. *Agurkjes*, *Agurketjes*. DA. *Eddikegurker*, *Peberagurker*. SW. *Syltgurker*. FR. *Cornichons*. IT. *Cetrioli inacetati*. SP. *Pepinos en escabeche*).

PORT. *Pepinos pequenös*. RUS. *Solienie ogurzii*), a small cucumber used for pickling.

GILD, or GUILD, a company of merchants. Hence are all our corporations derived; and our Gild-halls, from the public depositaries of their merchandise in early times, in which they carried on their traffic with foreigners.

GILDING is the application of gold to the surfaces of bodies: it is of two principal kinds, according to the method of applying the gold. Wool, leather, paper, and similar substances, are gilt by fastening on leaves of gold by means of some cement. But metals are gilt by a chemical application of the gold to the surface. This last is called water-gilding.

The gilding of wood, and similar substances, is of three kinds: oil-gilding, burnished gilding, and jappanners' gilding, which we shall severally describe, after noticing the materials and tools necessary for the operations.

Of gold-leaf.—There are three kinds of gold-leaf in common use. Pure gold-leaf, which is made by hammering gold till it is sufficiently thin. (See GOLD-BEATING.) Pale leaf-gold, which has a greenish colour, and is made in the same way, of gold alloyed with silver. Dutch gold, which is brought from Holland, and is, in fact, only copper-leaf coloured by the fumes of zinc. It is much cheaper than true leaf-gold, and is very useful where large quantities of gilding are wanted, which can be defended from the weather; and where great nicety is not required; but it changes its colour entirely when exposed to moisture; and in all cases, its beauty is soon impaired, unless well secured by varnish. It is therefore only a cheap substitute for true gold-leaf.

Of the instruments necessary for gilding.—The first instrument is the cushion, for receiving the leaves of gold from the books in which they are bought. It is made by covering a board with a double thickness of flannel; and over that a piece of buff leather, and fastening it tight round the edges. The knife for cutting the leaves into the requisite sizes should be made like a pallet-knife, and should not have its edge too sharp. The tip is a tool made by fastening the long hairs of a squirrel's tail between two cards; and is used for taking up the gold-leaf after it is cut, and applying it to the article to be gilded. A fitch pencil is used for the same purpose as the last, in taking up very small bits of gold-leaf. A ball of cotton is necessary for pressing down the leaf, after it is laid on. A large camel-hair brush is used for dusting the work, and clearing away the superfluous gold.

Oil-gilding.—First prime the work with boiled linseed-oil and white-lead; and when that is dry, cover it over with a thin coat of

gold size, made of stone-ochre ground in fat oil. When that is so dry as to feel clammy to the fingers, or to be what the gilders call tacky, it is fit for gilding. Having spread the leaves upon the cushion, cut them into slips of the proper width for covering the work, then take up the leaves from the cushion. Having applied them on the proper parts of the work, press them down by the ball of cotton. Repair, in like manner, any parts which you have omitted to cover.

When all the work is sufficiently covered, let it dry, and clean it off with the brush. This sort of gilding is the easiest, least expensive, and stands the weather best, and may be cleaned with a little water at any time; but wants the lustre of burnished gilding.

Burnished gilding. — This is the sort of gilding generally used for picture-frames, looking-glasses, &c. The wood intended to be gilt in this manner should first be well sized, and then covered with seven or eight coats of size and whitening, so as to form a body of considerable thickness. Having got a sufficiency of whitening upon the work, it must be carefully cleaned, taking care to free all the cavities and hollows from the whitening that may have choked them up, and by proper moulds and tools restoring the sharpness of the mouldings intended to be shewn. It is then to receive a coat of size, which is made by boiling Armenian bole with parchment size. This must also remain till it is sufficiently dry for gold. It must not be quite dry, therefore it would not be prudent to lay on more at a time, than can be gilt before it becomes too dry.

The work being thus prepared, place it a little declining from you; and having ready a cup of clean water, and some hair-pencils, moisten a part of the work, and then apply the gold to the moistened part. The gold will adhere closely to the work; proceed to wet the next part, and apply the gold as before, repeating this operation till the whole is completed; taking care not to let any drops of water come upon any part of the gold already laid on. Care should, therefore, be taken that no part be missed in going over it at first, as it is not so easily mended as the oil-gilding. The work being thus gilt, it is suffered to remain about 24 hours; when the parts that are designed to be burnished are polished with a dog's tooth, or, what is better, with an agate burnisher. The gilding must not be quite dry when burnished: there is a state proper for the purpose which experience alone teaches.

Japanners' gilding. — The gilding of japanned work consists in drawing with a hair-pencil, in gold size, the intended ornaments, and afterwards applying gold-leaf, or gold powder.

The gold size may be prepared thus:

Take of linseed-oil and of gum animi, four ounces. Set the oil to boil in a proper vessel, and then add the gum animi gradually in powder, stirring each quantity about in the oil till it appears to be dissolved, and then putting in another, till the whole is mixed with the oil. Let the mixture continue to boil, till, on taking a small quantity out, it appears of a thicker consistence than tar, and then strain the whole through a coarse cloth, and keep it for use; but it must, when applied, be mixed with vermilion and oil of turpentine. Having laid on the gold size, and suffered it to dry, the gold-leaf is applied in the usual way; or if it is not wanted to shine so much, gold powder is applied, which is made by grinding gold-leaf upon a stone with honey, and afterwards washing the honey away with water. If the gilding is to be varnished over, Dutch gold may be used, or *aurum musivum* or *mosaicum* may be used instead of gold powder.

To write on paper with letters of gold. — Put some gum arabic into common writing-ink, and write with it in the usual way. When the writing is dry, breathe on it; the warmth and moisture soften the gum, and will cause it to fasten on the gold-leaf; which may be laid on in the usual way, and the superfluous part brushed off. Or instead of this, any japanner's size may be used.

To lay gold upon white earthenware, or glass. — Procure some japanners' gold size, and with it draw your design upon the vessel to be gilt, moistening the gold size, as you find necessary, with oil of turpentine. Set your work in a clean place to dry for about an hour, and then place it so near the fire, that you could but just bear the heat of it with your hand for a few seconds. Let it remain there till it feels quite tacky, or clammy; then, having procured a cushion, and some leaf-gold, cut it into slips of the proper size, and lay it on with the little cotton ball. When the gold is all on, put the ware into an oven to be baked for two or three hours. Glasses, &c. may also be gilt by drawing the figures with shell-gold mixed with gum arabic, and a little borax. Then apply sufficient heat to it; and, lastly, burnish it.

Gilding on glass or porcelain, by burning in. — Dissolve gold in aqua regia, and evaporate the acid by heat, you will obtain a gold powder, or precipitate the gold from the solution by pieces of copper. Lay this gold on with a strong solution of borax and gum water, and it will be ready for burning in.

Gilding metals. — One method of applying gold upon metal is by first cleaning the metal to be gilt; then gold-leaf is laid on it, which, by means of rubbing with a polished blood-stone, and a certain degree of heat, are made to adhere perfectly well. In this

manner silver-leaf is fixed, and burnished, upon brass, in the making of what is called French plate; and sometimes also gold-leaf is burnished, upon copper, and iron.

Gilding metals by amalgamation. — A better method is, by previously forming the gold into paste, or amalgam, with mercury. In order to obtain an amalgam of gold and mercury, the gold is first to be reduced into thin plates or grains, which are heated red-hot, and thrown into mercury, previously heated, till it begins to smoke. Upon stirring the mercury with an iron rod, the gold totally disappears. The proportion of mercury to gold is generally as six or eight to one. The method of gilding by amalgamation is chiefly used for gilding copper, or an alloy of copper, with a small portion of zinc, which more readily receives the amalgam, and is also preferable on account of its colour, which more resembles that of gold than the colour of copper. When the metal to be gilt is wrought or chased, it ought to be previously covered with quicksilver before the amalgam is supplied, that this may be easier spread; but when the surface of the metal is plain, the amalgam may be directly applied to it. The metal required to be gilt is first rubbed over with a little aqua-fortis, by which the surfaces are cleaned from any rust or tarnish that might prevent the union of the two metals. The amalgam being then equally spread over the surface by means of a brush, the mercury is evaporated by a heat just sufficient for that purpose; for if it be too great, part of the gold may also be expelled, and part of it will run together, and leave some on the surface of the metal bare. While the mercury is evaporating, the piece is to be, from time to time, taken from the fire, that it may be examined; that the amalgam may be spread more equally by means of a brush; that any defective parts of it may be again covered, and that the heat may not be too suddenly applied to it. When the mercury is evaporated, which is known by the surface becoming entirely of a dull-yellow colour, the metal must then undergo other operations, by which the fine gold-colour is given to it. First, the gilded piece of metal is rubbed with a scratch-brush, (which is a brush composed of brass-wire,) till its surface is made smooth; then it is covered over with a composition called gilding-wax, and is again exposed to the fire till the wax is burnt off. This wax is composed of bees'-wax, frequently mixed with some of the following substances: red ochre, verdigris, copper scales, alum, vitriol, borax; but according to Dr. Lewis, the saline substances are sufficient, without any wax. By this operation the colour of the gilding is heightened; and the effect seems to be produced by a perfect dissipation of some mercury remaining after the former operation. The gilt surface is then covered over with a

saline composition, consisting of nitre, alum, or vitriolic salt, ground together, and mixed up into a paste with water or urine. The piece of metal thus covered is exposed to a certain degree of heat, and then quenched in water. By this method its colour is further improved, and brought nearer to that of gold. This effect seems to be produced by the acid of the nitre (which is disengaged by the sulphuric acid of the alum, during the exposure to the heat), acting upon any particles of copper which may happen to lie upon the gilded surface.

Lastly, some artists think that they give an additional lustre to their gilt work, by dipping it in a liquor prepared by boiling some yellow materials; as sulphur, orpiment, or turmeric. The only advantage of this operation is, that part of the yellow matter remains in some of the holes of the carved work, in which the gilding is apt to be more imperfect, and to which it gives a rich and solid appearance. It may be here noticed, that the use of the aqua-fortis, or nitric acid, mentioned in the beginning of the process, is not, as is generally supposed, confined merely to cleansing the surface of the metal to be gilt from rust or tarnish; but it also greatly facilitates the application of the amalgam to the surface of that metal, probably in the following manner: It first dissolves part of the mercury of the amalgam; and when the solution is applied to the copper, this latter metal, having a stronger disposition to unite with the nitrous acid than the mercury has, precipitates the mercury upon its surface, in the same manner as a polished piece of iron precipitates upon its surface copper from a solution of blue vitriol. When the metal to be gilt is thus covered with a thin coat of precipitated mercury, it readily receives the amalgam. On the subject of gilding by amalgamation, Dr. Lewis has the following remarks: "There are two principal inconveniences in this business; one, that the workmen are exposed to the fumes of the mercury, and generally, sooner or later, have their health greatly impaired by them; the other, the loss of the mercury; for though part of it is said to be detained in the cavities made in the chimneys for that purpose, yet the greatest part of it is lost. From some trials I have made, it appeared that both these inconveniences, particularly the first and most considerable one, might be in a good measure avoided, by means of a furnace of a due construction."

If the communication of a furnace with its chimney, instead of being over the fire, is made under the grate, the ash-pit door, or other apertures beneath the grate, closed, and the mouth of the furnace left open, the current of air, which otherwise would have entered beneath, enters now at the top, and passing down through the grate to the chimney, carries with it completely both the va-

pour of the fuel, and the fumes of such matters as are placed upon it. The back part of the furnace should be raised a little higher above the fire than the fore part, and an iron plate laid over it, that the air may enter only at the front, where the workman stands, who will be thus effectually secured from the fumes, and from being incommoded by the heat, and at the same time have full liberty of introducing, inspecting, and removing the work. If such a furnace be made of strong forged (not milled) iron plate, it will be sufficiently durable. The upper end of the chimney may reach above a foot and a half higher than the level of the fire; over this is to be placed a larger tube, leaving an interval of an inch, or more, all round, between it and the chimney, and reaching to the height of ten or twelve feet; the higher the better. The external air passing up between the chimney and the outer pipe, prevents the latter from being much heated, so that the mercurial fumes will condense against its sides into running quicksilver, which falling down to the bottom, is there caught in a hollow rim, formed by turning inwards a portion of the lower part, and conveyed by a pipe at one side into a proper receiver.

Gilding iron or steel.—In gilding iron or steel, by means of an amalgam, as the metal has no affinity for the mercury, an agent must be employed to dispose the surface to receive the gilding. For this purpose a solution of mercury in nitrous acid (aqua-fortis), or what the workmen call quicksilver water, is applied to the parts intended to be gilded; the acid, by a stronger affinity, seizes on a portion of the iron, and deposits in the place of it a thin coating of mercury, which will not refuse an union afterwards with the gold amalgam that may be applied; but by this process the surface of the metal is injured by the nitrous acid, and the union of the mercury is very slight, so that a bright and durable gilding cannot be obtained.

Another method.—Sometimes a solution of blue vitriol is applied, with a camel's-hair pencil, to the parts of the steel intended to be gilt. By a chemical action, exactly similar to what we have described as taking place when a solution of nitrate of mercury is employed, a thin coating of copper is precipitated on the metal. Copper having an affinity for mercury, a kind of union may by this means be effected between the amalgam and the iron or steel, as the case may be. In whichever of these methods the amalgam is brought into union with the steel, the surface is injured by the action of the acid employed, and still a heat sufficient to volatilize the mercury must be afterwards used.

Gilding of iron by heat.—When the surface is polished bright, it must be heated till it becomes blue. Gold-leaf is then applied to

its surface, and burnished down. It is then heated again, and another layer of gold burnished on it. In this manner three or four coats are given, according to the strength of the gilding required.

An improved process for gilding iron or steel.

—The first part of the process consists in pouring over a solution of gold in nitro-muriatic acid, (aqua regia,) about twice as much ether, which must be done with caution, and in a large vessel. These liquids must then be shaken together: as soon as the mixture is at rest, the ether will be seen to separate itself from the nitro-muriatic acid, and to float on the surface. The nitro-muriatic acid becomes more transparent, and the ether darker than they were before; the reason of which is, that the ether has taken the gold from the acid. The whole mixture is then to be poured into a glass funnel, the lower aperture of which is small; but this aperture must not be opened till the fluids have completely separated themselves from each other. It is then to be opened; by which means the liquid which has taken the lowest place by its greater gravity, viz. the nitro-muriatic acid, will run off; after which the aperture is to be shut, and the funnel will then be found to contain nothing but ether mixed with gold, which is to be put into well-closed bottles, and preserved for use. In order to gild iron or steel, the metal must be first polished with the finest emery, or rather with the finest crocus martis, or colcothar of vitriol, and common brandy. The auriferous ether is then to be applied with a small brush; the ether soon evaporates, and the gold remains on the surface of the metal. The metal may then be put into the fire and afterwards polished. By means of this auriferous ether, all kinds of figures may be delineated on iron, by employing a pen or fine brush. It is in this manner that the Sohlinger sabre-blades are gilded.

Instead of ether, the essential oils may be used, such as oil of turpentine, or oil of lavender, which will also take gold from its solution.

Gilding of brass and copper.—Fine instruments of brass, in order that their surfaces may be kept longer clean, may be gilded in the following manner: Provide a saturated solution of gold, and having evaporated it to the consistence of oil, suffer it to shoot into crystals. These crystals must then be dissolved in pure water, and the articles to be gilded being immersed in it are then to be washed in pure water, and afterwards burnished. This process may be repeated several times, till the articles have been well gilt. A solution of gold crystals is preferred to a mere solution of gold, because in the latter there is always a portion of free acid, which will not fail to exercise more or less action on the surface of the brass or copper, and injure its polish.

Grecian gilding.—Dissolve some mercury in muriatic acid (spirit of salt), which will give a muriate of mercury. Mix equal parts of this and sal ammoniac, and dissolve them in aqua-fortis. Put some gold into this, and it will dissolve. When this is applied to silver, it becomes black; but by heating, it assumes the appearance of gilding.

To make shell-gold.—Grind up gold-leaf with honey in a mortar; then wash away the honey with water, and mix the gold powder with gum water. This may be applied to any article with a camel's-hair pencil, in the same way as any other colour.

GILL, a measure of capacity equal to a quarter of an English pint. It is in common use for measuring spirituous liquors, dispensed in drams.

GIMLET, or **GIMBLET**, (*Gimlets*. GER. *Bohrer*, *Nagelbohrer*. DU. *Bovr*. DA. *Boer*. SW. *Nafrar*. FR. *Taïères*. IT. *Succhi*, *Verrine*. SP. *Barrenas*. PORT. *Trados*, *Verrumas*. RUS. *Buravii*. POL. *Swidry*.) an iron borer, with a screw at its point. Gimlets are chiefly manufactured at Birmingham and Sheffield.

GIMP, a kind of silk twist, lace, or edging, used in trimming garments, &c. chiefly manufactured at Manchester.

GIN, See **GENEVA**.

GINGER, (GER. *Ingwer*. DU. *Gember*. DA. *Ingefær*. SW. *Ingefära*. FR. *Gingembre*. IT. *Zenzero*, *Zenzovero*, *Zinzabo*, *Gengiovo*. SP. *Jenjibre*, *Agengibre*. PORT. *Gengivre*. RUS. *Inbir*. POL. *Imbir*. LAT. *Zingiber*.) is a knotty, flattish root, of a fibrous substance, of a pale or yellowish colour, covered with a thin, dusky pellicle, which is usually taken off while it is fresh, and before it is brought to Europe.

The plant which produces ginger does not appear far above ground. It puts forth long, green leaves, somewhat similar to those of the rose, and its flowers are red, slightly tinged with green. Good ginger ought to be new, dry, well filled, and difficult to be broken, of a reddish-grey surface, resinous within, and of a hot, pungent flavour.

The ginger which is imported comes principally from the East Indies, (especially from Malabar and Ceylon,) also from Jamaica, Barbadoes, &c. There are two sorts of ginger; white and black: of which the former is most valuable. Ginger yields, upon distillation, a fiery, hot, essential oil, less grateful than the spice itself. The Indians are fond of ginger; they eat both the young shoots of the leaves and the roots themselves, cut small in their sallads and broths; and they make a very fine sweetmeat of them, preserving them with sugar. The Dutch East-India Company are said to import the finest species of ginger from China.

GINSENG, or **GINSANG**, (GER. *Kraflwurzel*, *Ginseng*. DU. *Ginseng*, *Ginseng*. DA. SW. FR. and IT. *Ginseng*. SP. *Jin-*

seng. PORT. *Ginsão*. LAT. *Ginseng*, *Panax*.) was formerly supposed to grow in Chinese Tartary, affecting mountainous situations, shaded by close woods; but it has now been long known that this plant is also a native of North America, whence M. Sarasin transmitted specimens of it to Paris in the year 1704; and the ginseng since discovered in Canada, Pennsylvania, and Virginia by Lafiteau, Kalm, Bartram, and others, has been found to correspond with the Tartarian species; and its roots are now regularly purchased by the Chinese. The dried root of ginseng, as imported hither, is about the thickness of the little finger, about three or four inches long, frequently forked, transversely wrinkled, of a horny texture, and of a yellowish-white colour both inside and outside. On the top are commonly one or more little knots, which are the remains of the stalks of the preceding years, and from the number of which the age of the root is judged of. "To the taste it discovers a mucilaginous sweetness, approaching to that of liquorice, accompanied with some degree of bitterness, and a slight aromatic warmth, with little or no smell. It is far sweeter, and of a more grateful smell, than the roots of fennel, to which it has by some been supposed similar; and differs likewise remarkably from those roots in the nature, and pharmaceutic properties, of its active principles, the sweet matter of ginseng being preserved entire as well as the spirituous extract; whereas that of fennel-roots is destroyed or dissipated in the inspissation of the watery tincture. The slight aromatic impregnation of the ginseng is likewise in a good measure retained in the watery extract, and perfectly in the spirituous."

The Chinese ascribe extraordinary virtues to the root of ginseng; and have long considered it as a sovereign remedy in almost all diseases to which they are liable, having no confidence in any medicine, unless in combination with it. The greater part of the ginseng consumed in this country is imported from America, though the India Company bring some from China.

GIRDING-GIRT, in the sea language. A ship is "girt," or has "a girding-girt," when her cable is so light or strained, upon the turning of the tide, that she cannot get over it, but lies across the tide.

GIRDERS. Their business formerly consisted in making belts, girdles, and other military accoutrements that are now blended with other trades, which are entered of the civic association, called the Girdlers' Company.

GIRO, or **AGITO**. See **ABUCCO**.

GLASS, (GER. DU. DA. and SW. *Glas*. FR. *Vitre*, *Verre*. IT. *Vetro*. SP. *Vidrio*. PORT. *Vidro*. RUS. *Steklo*. POL. *Sklo*. LAT. *Vitrum*.) a transparent, brittle, factitious body, produced by the action of fire upon a

fixed salt and sand, or stone, that readily melts. The fixed alkalis have a strong affinity for several of the earths, particularly for silica and alumina, which they dissolve in considerable quantity, when assisted by heat. When a strong heat is applied to a mixture of fixed alkali and silica, it melts, and forms a transparent mass well known by the name of glass. The materials employed in the manufacture of glass may be reduced under three classes, namely, alkalies, earths, and metallic oxides.

The fixed alkalies may be employed indifferently; but soda is preferred in this country. The soda of commerce is usually mixed with common salt, and combined with carbonic acid. It is proper to purify it from both of these foreign bodies before using it.

The earths are silica, lime, and sometimes a little alumina. Silica constitutes the basis of glass. It is employed in the state of fine sand or flint; and sometimes, for making very fine glass, rock crystal is employed. When sand is used, it ought, if possible, to be perfectly white; for when it is coloured with metallic oxides, the transparency of the glass is injured.

Such sand can only be employed for very coarse glasses. It is necessary to free the sand from all the loose earthy particles with which it may be mixed, by washing it well with water. Lime renders glass less brittle, and enables it to withstand better the action of the atmosphere. It ought, in no case, to exceed the 20th-part of the silica employed, otherwise it corrodes the glass pots. This may be prevented by throwing a little clay into the melted glass; but in that case a green glass only is obtained. The metallic oxides employed are the red oxide of lead or litharge, and the white oxide of arsenic. The red oxide of lead, when added in sufficient quantity, enters into fusion with silica, and forms a glass without the addition of any other ingredient. Five parts of minium, and two of silica, form a glass of an orange-colour, and full of striæ. Its specific gravity is 5. The red oxide of lead renders glass less brittle and more fusible; but when added beyond a certain proportion, it injures the transparency and whiteness of glass. The white oxide of arsenic answers the same purposes with that of lead, but on account of its poisonous qualities it is seldom used. It is customary to add a little nitre to the white oxide of arsenic, to prevent the heat from reviving it, and rendering it volatile. When added beyond a certain proportion, it renders glass opaque and milky, like the dial-plate of a watch. When any combustible body is present, it is usual in some manufactures to add a little white oxide of arsenic. This supplying oxygen, the combustible is burnt, and flies off; while the revived arsenic is at the same time volatilized.

After mixing the alkali and sand together, it is usual to expose them for some time to a moderate heat. This serves several purposes. It drives off all combustible bodies which may happen to be mixed with the sand: it produces a commencement of combination which makes the glass afterwards less liable to corrode the clay pots in which it is melted; and the alkali, by this incipient combination, is not so apt to be volatilized, which might be the case if the materials were exposed at once to a violent heat. The mixture, after being thus heated, is called the frit. Through the domes in which the frit is heated, it is usual to see very thin bubbles of glass passing; a proof that some of the materials are volatilized during this first part of the process. The frit, while still hot, is introduced into large pots made of a mixture of pure clay and baked clay, and exposed to a heat sufficient to melt it completely. The fusion must be continued till the effervescence occasioned by the separation of the carbonic acid from the soda has subsided, and the opaque scum, known by the name of glass-gall, which collects on the surface of the glass, must be removed. This scum is occasioned by the common salt and other foreign bodies which are always mixed with the soda of commerce. When the fusion has been continued the proper time, the furnace is allowed to cool a little. In that state the glass is exceedingly ductile, and readily assumes any shape that the workman pleases. If the glass vessels, after being formed, were cooled rapidly, they would contract unequally, and become in consequence so brittle as to fall to pieces whenever they were handled. To prevent this inconvenience, they are put into a large red-hot furnace, which is allowed to cool very slowly to the temperature of the air. This process is called annealing.

There are different kinds of glass manufactured for different purposes: the principal of these are flint-glass, crown-glass, and bottle-glass. Flint-glass is formed of soda, pounded flints, and oxide of lead. It is the densest, most transparent, and most beautiful glass, and is often called crystal. Crown-glass contains no lead. It is composed of soda and fine sand; and is called window-glass. Bottle-glass is the coarsest of all. It is composed of kelp, or the refuse of soap-boilers, and common sand. Its green colour is owing to the admixture of iron. Of these species the most fusible is flint-glass, and the least fusible bottle-glass. Glass is often tinged of various colours by mixing with it, while in fusion, some one or other of the metallic oxides; and on this process, well conducted, depends the formation of pastes or factitious gems.

Blue glass is formed by means of oxide of cobalt.

Green, by the oxide of iron or of copper.

Violet, by oxide of manganese.

Red, by a mixture of the oxides of copper and iron.

Purple, by the purple oxide of gold.

White, by the oxide of arsenic and of zinc.

Yellow, by the oxide of silver, and by combustible bodies.

By several statutes, regulations are made for making, importing, and exporting glass, which is to be under the management of the officers of the customs and excise.

The following are the principal regulations relative to the glass trade :

Glass-makers must take out a licence at the excise office, and are not to begin to charge any pot without giving *twelve hours'* notice, in writing, of the time of beginning, the weight of metal, and species of glass.

Manufacturers of flint-glass are allowed three hours for beginning to charge their pots, after the time specified in their notices.

The following compensation is allowed for waste, in pots containing 100lb. weight, viz. for flint, enamel, stained, and phial glass, one-fourth of the metal, and one inch at the bottom ; in pots of less than 100lb. weight, one-fifth of the metal ; in pots for crown, paste, and window glass, one-fourth of the metal, and four inches at the bottom.

Cast plate is to be charged by weight if squared, and measured in the presence of the officer ; and makers are to give six hours' notice in London, and twelve hours in the country, before drawing plates out of the annealing arch, on penalty of 50*l*.

Manufacturers are to permit officers to take samples, and are entitled, on demand, to copies of the officers' return.

Entries to be made in writing, upon oath, and duties to be paid monthly in London, and every six weeks in the country.

Duty upon materials lost or spoiled to be allowed, due proof being made of such fact.

Officers at all times, by day or night, are to have access to work-houses, to gauge the materials, and mark the pots as they shall think fit.

Glass Bottle Manufacturers.—The whole of the metal intended to be manufactured into common glass-bottles, is to be worked within sixteen hours next after the same shall be begun ; and when the bottles are deposited in the annealing arches, manufacturers are again, in the presence of the officer, to charge each pot with fresh materials, other than broken glass, not less than 50lb. weight ; and declarations are to be delivered, in writing, of the number of such bottles, on penalty of 100*l*.

Manufacturers of glass bottles are to affix proper hooks or staples, with scales and weights, to be approved of, in writing, by the surveyor or supervisor.

Notices are not to be given for drawing out bottles but between eight in the morning and six in the afternoon.

Bottles weighed to be kept separate.

Makers using private annealing arches, or fraudulently removing or concealing any common glass bottles, before they are weighed, incur a penalty of 500*l*.

No phials to be made in buildings entered for making common glass-bottles, or in adjoining buildings, on penalty of 200*l*.

The 55 Geo. 3. c. 13. prescribes the oath to be taken on the exportation of glass generally ; so does the 56 Geo. 3. c. 108. respecting the size, thickness, and quality of plate-glass ; to entitle the exporter to the drawbacks on British glass exported. *See App.* As to flint glass, see 1 G. 4. c. 16. — The excise law relating to various kinds of glass is continued by 1 & 2 Geo. 4. c. 13.

GLASSES, or DRINKING GLASSES, (GER. *Glaser*. DU. *Drinkglazen*, *Glazen*. DA. *Glase*. SW. *Dricksglas*. FR. *Verres*. IT. *Bicchieri*. SP. *Vasos y copas*. PORT. *Copos*, *Vidros*. RUS. *Stakani*. POL. *Sklanki*.) cups or vessels of glass used for drinking in. Drinking glasses are either plain, or adorned by the glass-cutter, and some of the latter are so highly finished, especially those cut at London, as to sell at the high prices of from one to three guineas per glass. Some of this description have sold well on the continent of Europe.

GLASS-GALL. *See* SANDIVER.

GLASS-GRINDER. The glass-grinder has the plate sent to him rough, to grind and polish it. For this purpose he fixes the plate horizontally in a heavy wooden frame, and rubs it backwards and forwards upon a plane, on which sand and water are constantly running. The glass being thus on both sides ground perfectly true, is afterwards polished with emery and putty.

GLAUBER'S SALT, *Sal catharticus Glauberi*, is obtained by dissolving the spirit of sea-salt in a sufficient quantity of water, filtrating the solution, and evaporating it to a pellicle. It is then set in a cool place, and the salt will crystallize in large and fair transparent shoots. This is a well-known and excellent cathartic ; its dose is from half an ounce to one ounce. Our chemists have a method of counterfeiting it, by adding the vitriolic acid to a solution of the common bitter salt, called Epsom salt ; but this may be easily discovered ; the true and genuine salt being always much fairer and more transparent than this sophisticated kind. The bitter purging salt from which this is prepared, is what is usually sold in our shops under the name of Epsom salt, and is also called *sal catharticum amarum*. The best Glauber's salt is made in France, and at some ports of other countries seated on the Mediterranean.

GLAZIER, an artificer who works in glass. The principal part of a glazier's business consists in fitting panes of glass to the sashes and window-frames of houses, pictures, &c.

GLAZING, the crusting over earthenware by a vitreous substance, the basis of which is commonly lead. The usual composition for glazing ware is formed of white sand 40 pounds, of red-lead 20 pounds, of pearl-ashes 20 pounds, and of common salt 12 pounds. Powder the sand by grinding it, and then add it to the other ingredients, and grind them together; after which calcine them for some time with a moderate heat, and when the mixture is cold, reduce it to powder, and when wanted for use, temper it with water. The proportion of these ingredients may be occasionally varied. The ware, after being turned on the wheel and dried in the open air, is covered over with the above composition by means of a brush; and when set in the furnace, the violent heat soon reduces it to a perfect glass, covering the whole internal and external surface of the vessel. Lead being poisonous, a transparent glazing may be prepared without it, by calcining 40 pounds of white sand, 25 pounds of pearl-ashes, and 15 pounds of common salt, and proceeding as before: and a more perfect transparent glazing may be made of sand 40 pounds, of wood-ashes perfectly burned 50 pounds, of pearl-ashes 10 pounds, and of common salt 12 pounds. Kunckle gives the following receipts as used at Delft and other Dutch manufactories, viz.

Black is made of eight parts of red-lead, iron-filings three, copper-ashes three, and zaffer two measures. This when melted will make a brown-black, and if wanted blacker, add more zaffer to it.

Blue is thus prepared: Take lead-ashes or red-lead one pound, clear sand or powdered flints two pounds, common salt two pounds, white calcined tartar one pound, Venice or other glass half a pound, zaffer half a pound; mix them and melt them for several times, quenching them always in cold water. If you would have it fine and good, it will be proper to put the mixture into a glass furnace for a day or two. Another blue glazing may be formed of one pound of tartar, a quarter of a pound of red-lead, half an ounce of zaffer, and a quarter of a pound of powdered flints, which are to be fused and managed as in the last receipt. Or, take two pounds of calcined lead and tin, add five pounds of common salt, five pounds of powdered flints, and of zaffer, tartar, and Venetian glass, each one pound. Calcine and fuse the mixture as before. Or again, take of red-lead one part, of sand three parts, and of zaffer one part. For a violet-blue glazing, take four ounces of tartar, two ounces of red-lead, five ounces of powdered flints, and half a drachm of manganese.

Brown is made of red-lead and flints, of each 14 parts, and of manganese one part fused. A brown glazing, to be laid on a white ground, may be made of manganese

two parts, of red-lead and white glass, each one part, twice fused.

Flesh-colour is made of 12 parts of lead-ashes, and one of white glass.

Gold-colour.—Take of litharge three parts, of sand or calcined flint one part; pound and mix these very well together, then run them into a yellow glass with a strong fire. Pound this glass, and grind it into a subtile powder, which moisten with a well-saturated solution of silver; make it into a paste, which put into a crucible and cover it. Give it at first a gentle degree of fire; then increase it, and continue it till you have a glass which will be green. Pound this glass again, and grind it to a fine powder; moisten this powder with some beer, so that by means of a hair-pencil you may apply it upon the vessels, or any piece of earthenware. The vessels that are painted or covered over with this glazing must be first well heated, then put under a muffle; and as soon as the glass runs, you must smoke them by holding them over burning vegetables, and take out the vessels. Kunckle gives several preparations for a gold-coloured yellow glazing. This may be produced by fusing a mixture of three parts of red-lead, two parts of antimony, and one part of saffron of Mars; by again melting the powdered mass, and repeating the operation four times, or by fusing four or five times a composition of red-lead and antimony, of each one ounce, and of scales of iron half an ounce; or by calcining and fusing together eight parts of red-lead, six parts of flint, one part of yellow ochre, one part of antimony, and one part of white glass. A transparent gold-coloured glazing may be obtained by twice fusing red-lead and white flints, of each 12 parts, and of filings of iron one part.

Green may be prepared by eight parts of litharge or red-lead, eight parts of Venice glass, four parts of brass-dust or filings of copper; or of ten parts of litharge, twelve of flint or pebble, and one of æs ustum or copper-ashes. A fine green glazing may be produced by fusing one part of the Bohemian granite, one of filings of copper, one of red-lead, and one of Venetian glass; or by fusing one part of white glass, the same quantity of red-lead, and also of filings of copper; powdering the mass, and adding one part of Bohemian granite to two parts of this powder. A fine green may be obtained by mixing and grinding together any of the yellow glazings with equal quantities of the blue glazings; and all the shades and tints of green may be obtained by varying the proportion of the one to the other, and by the choice of the kind of yellow and blue.

Sea-green is made by five pounds of lead-ashes, one pound of tin-ashes, three pounds of flint, three quarters of a pound of salt,

half a pound of tartar, and half a pound of copper-dust.

Iron-colour is prepared with fifteen parts of lead-ashes or red-lead, fourteen of white sand or flints, and five of calcined copper. This mixture is to be calcined and fused.

Liver-colour is prepared by twelve parts of litharge, eight of salt, six of pebble or flint, and one of manganese.

Purple brown consists of lead-ashes fifteen parts, clean sand or powdered flints eighteen parts, manganese one part, and white glass fifteen measures, to which some add one measure of saffron.

Red is made of antimony three pounds, litharge or red-lead three, and rust of iron one; grind them to a fine powder. Or take two pounds of antimony, three of red-lead, and one of calcined saffron of Mars, and proceed as before.

White.—The white glazing of common ware is made of forty pounds of clear sand, seventy-five pounds of litharge or lead-ashes, twenty-six of pot-ashes, and ten pounds of salt; these are three times melted into a cake, quenching it each time in clear cold water. Or it may be made of fifty pounds of clean sand, seventy of lead-ashes, thirty of wood-ashes, and twelve of salt. For a fine white, take two pounds of lead and one of tin; calcine them to ashes; of this take two parts; calcined flint, white sand, or broken white glass, one part; and salt one part: mix them well together, and melt them into a cake for use. The trouble of calcining the tin and lead may be prevented by procuring them in a proper state. A very fine white glazing may be obtained by calcining two parts of lead and one of tin, and taking one part of this mass, and of flints, and common salt, of each one part, and fusing the mixture. A white glazing may also be prepared by mixing 100 pounds of massicot, 60 of red-lead, 20 of calcined tin or putty, and 10 of common salt, calcining and powdering the mixture several times.

Yellow is prepared of red-lead three pounds, calcined antimony, and tin, of each three pounds; or, according to some, of equal quantities of the three ingredients. These must be melted into a cake, then ground fine, and this operation repeated several times; or it may be made of fifteen parts of lead-ore, three parts of litharge of silver, and fifteen parts of sand. A fine yellow glazing may be procured by mixing five parts of red-lead, two parts of powdered brick, one part of sand, one part of white glazings, and two parts of antimony, calcining the mixture and then fusing it. Or take four parts of white glass, one part of antimony, three parts of red-lead, and one part of iron-scales, and fuse the mixture; or fuse sixteen parts of flints, one part of iron-sfilings, and twenty-four parts of litharge. A light yellow glazing may be produced

with ten parts of red-lead, three parts of antimony, and three of glass, and two parts of calcined tin. (*See gold-colour above*.) A citron yellow is made of six parts of red-lead, seven parts of fine red brick-dust, and two parts of antimony. This mixture must be calcined day, and night, for the space of four days, in the ash-hole of a glass-house furnace, and at last urged to fusion. *See STONE-WARE, POTTERY, and PORCELAIN.*

GLOVES, (*GER. Handschuhe. Du. Handschoenen. DA. Handsker. Sw. Handskar. FR. Gants. IT. Guanti. Sp. Guantes. PORT. Luvas. RUS. Rukawizii, Pertschatki, Golizii. POL. Rekawice.*) with respect to commerce, are distinguished into wash or tan leather, silk, thread, cotton, worsted, &c. Leathern gloves are made of chamois, kid, lamb, doe, elk, buff, &c. The leather of gloves is not tanned, properly speaking, but cured with alum, which renders it soft and pliable, and therefore more proper for gloves, &c. The Limerick gloves, likewise called chicken gloves, are made of leather, and are remarkably fine. These gloves are manufactured in a city in Ireland from which they derive their name, and whence they have, from time to time, been sent to most parts of Europe, the East Indies, and America. The Limerick gloves are mostly worn by ladies. There is a good imitation made at Woodstock, Worcester, and some other parts of England.

Large quantities of cotton gloves are manufactured at Nottingham and Leicester; and the greater part of the woollen gloves is made in Wales, Scotland, and the north of England.

Leather gloves and mits of foreign manufacture, imported, are forfeited, and the importers are liable to the penalty of 200*l.* for each offence, and selling or offering to sale, concealing or having such in custody, except worn as apparel, incurs a penalty of 200*l.* and forfeiture.

Leather gloves and mits of foreign manufacture, having been seized, and any question arising as to the places of manufacture, the proofs are to lie upon the claimers; and the buyers thereof, not being the importers, discovering the sellers, shall acquit themselves thereby of the penalties.

The three material statutes to be adverted to, respecting these penalties, are 8 Ann. c. 7.; 2 Geo. 1. c. 30.; and 6 Geo. 3. c. 19.; all of which, being made *in pari materia*, and not one of them specifically superseded, or repealed, by the subsequent ones, are still in force, and enable the crown to recover all the different penalties imposed by them, any, or all, of them. *R. v. Laggors & Uxor, 1 Price's Rep.*

Frames for knitting gloves may not be exported; 7 & 8 Will. 5. c. 20. s. 8.

GLUE. (*GER. Leim. Du. Lim. DA. Lim, Liim. Sw. Lem. FR. Colle. IT. Colla. SR.*

Cola. PORT. *Gola, Colla, Grude.* RUS. *Klei.* POL. *Kley.* LAT. *Colla.*) This well-known substance has been long manufactured in most countries, and employed to cement pieces of wood together. It is extracted by boiling water from animal substances, and differs in its qualities according to the substances employed. Bones, muscles, tendons, ligaments, membranes, and skins, all yield it; but the quality is best when skins alone are employed; and those of old animals yield a much stronger glue than those of young. English glue is considered as the best, owing to the care with which it is made. The parings of hides, pelts from furriers, the hoofs and ears of horses, oxen, calves, sheep, &c. are the best substances from which it is extracted in Britain, and quantities of these articles are imported for the purpose. They are first digested in lime-water to clean them, then steeped in clean water, laid in a heap, till the water runs off, and then boiled in brass cauldrons with pure water. The impurities are skimmed off as they rise; and when the whole is dissolved, a little alum or finely powdered lime is thrown in. The skimming having been continued for some time, the whole is strained through baskets, and allowed to settle. The clear liquid is gently poured back into the kettle, boiled a second time, and skimmed till it is reduced to the proper consistency. It is then poured into large boxes, where it concretes. On cooling into a jelly, it is cut by a spade into square cakes, which are again cut by means of a wire into thin slices; these are put into a kind of coarse net-work and dried in the open air.

A very strong glue may be obtained by a spirituous solution of isinglass, which is said to be so extremely adhesive, that pieces of wood glued with it separate elsewhere sooner than the place where they have been joined. *See title CEMENT.*

The best glue is extremely hard and brittle; it has a dark-brown colour, and equal degree of transparency without black spots. When put into cold water it swells very much, and becomes gelatinous, but does not dissolve. When glue is soluble in cold water, it is a proof that it wants strength. Glue is an article of great consumption among joiners, cabinet-makers, hatters, &c.

GLUTTON-SKIN. (GER. *Vielfrass,* ROSOMAK. DU. *Veelvraatvellen.* DA. *Järf,* JERF, FILFRAS. SW. *Järf, Jerf, Filfras.* FR. *Glouton, Glouttu.* RUS. *Rosomacha, Rosomak.* POL. *Rosomaka.*) The glutton is a voracious animal, inhabiting the mountainous parts of the north of Asia. It is not quite so large as a wolf, but is so fierce that it has been known to put three dogs to flight. The Russians highly esteem the skin of this beast, on account of the peculiar fineness of its fur.

GNOMON, the style, pin, or cock of a

dial, which by its shadow shows the hour of the day.

GOAT-SKINS. (DU. *Geitenvellen.* DA. *Gedebukskind, Gedeskind.* SW. *Getskinn.* FR. *Peaux de chèvre.* IT. *Pelli di Capre.* SP. *Pieles de cabras.* PORT. *Peltes de cabras.* POL. *Koziaskora.* LAT. *Caprarum pelles.*) The skin of the goat is peculiarly well adapted for the glove manufactory; and as it takes a dye better than any other skin, it was formerly much used for hangings in the houses of people of fortune; being susceptible of the richest colours. The skin of the chamois goat is also in high esteem, as yielding fine leather, whereof gloves of peculiar softness are made.

The goat is an animal common in most parts of Great Britain, but especially in Wales, and other mountainous districts of the kingdom. The hair of the goat is manufactured into various articles, such as coarse hair-cloths, &c. The Angora goat is but little known in this country, but yields a valuable article, the Angora wool; a kind of wool, or rather hair, which the goats that pasture in the vicinity of Angora, a town of Natolia, produce. There are two species of Angora goats, namely, the *kara-gueschy*, and the *tistik-gueschy*. The *kara-gueschy*, or black goat, is similar in appearance to the European goat, and is common in Syria, Natolia, and many other parts of the East. Its fleece is black, or more properly speaking, dark brown. The wool is long and straight, fine towards the extremity which is attached towards the skin, but blacker and stiffer about the contrary end. The *kara-gueschy* is shorn annually, but its wool is not exported, being used for home consumption, in the manufacture of coarse clothing and sacking. Beneath the long wool just described, grows a fine short fleece, each fibre of which is about an inch or an inch and a half in length, and this, which is of a yellowish-grey colour, constitutes the most estimable produce of the animal. It is obtained by daubing over the skin with water saturated with lime; before the shearing takes place, and in the course of a few minutes, the coarse and fine wool both fall off the skin, and are easily separated one from the other. The fine wool is exported mostly for France, where it is employed in the manufacture of the best hats. The Syrian wool is not esteemed, but the wool of Angora, Erzerum, and the northern parts of Persia, enjoys good repute. It is conjectured that the noted Cashmerian shawls are actually made from fine wool of the animal in question.

The *tistik-gueschy*, or woolled goat, differs widely in appearance from the European goat, and indeed presents such variety even in the same province, that many have been led to divide *tistik-gueschys* of the same race into different species. The *tistik-*

gueschy, which Buffon denominates '*the Angora goat*,' is much lower and less strong than the kara-gueschy. Its fleece is of a dazzling white, the fibres which compose it are long, slender, silky, and naturally curly. The fineness of the fleece is extreme, and the fibres as slender and pliable as the wool of the Spanish merinos, whilst those of the kara-gueschy are nearly as wiry as horse-hair. These long and curly fibres constitute the entire fleece of the tistik-gueschy, being totally unmixed with any shorter or finer kind of wool, and just as slender at one extremity as the other. The tistik-gueschy is only to be met with in the environs of Angora; whose soil is so peculiarly adapted for preserving the original character of the animal, that it is scarcely removed to any other part of the East before its wool becomes coarse and of little value. The territory of Angora is mountainous, and its heights, which during two months of the year are covered with snow, abound in springs of pure and wholesome water, whence flow innumerable rivulets that fertilize the soil and cover it with fat pastures. So soon as the severe weather is over, the tistik-gueschy is turned out to pasture, and passes the whole of the fine weather on the mountains, not even being housed at nights, till the approach of winter obliges the herdsmen to drive the animal home each evening, to prevent its perishing from the severity of the cold. The she-goats feed in flocks of from 200 to 300, and are mingled with the bucks. The latter are bigger and stronger than the females, and their fleece like those of the former are white and curled, but rather coarser. The flesh of the tistik-gueschy is better than that of the common goat; but it is seldom killed before it has attained the age of five years, when its wool begins to grow sapless and coarse. The tistik-gueschys are shorn annually. After being washed on the animal's back in running water, the fleece is cut off with long shears of steel. The fleece of a she-goat weighs generally about from 45 to 54 lb. Of the wool of the tistik-gueschy muffs for ladies' wear have long been manufactured: shawls are likewise made from this wool, which are, if any thing, superior to the Cashmerian shawls. The beauty, and fineness, of the tistik-gueschy's wool have induced some individuals to introduce the breed into France; but there has not yet been sufficient time elapsed for ascertaining the success of the experiment. The price of the female tistik-gueschy, at Angora, varies from 10 to 12 dollars, and that of the male from 12 to 15. Those who should be inclined to purchase a flock of Angoras, for experimental purposes, ought to hire shepherds on the spot, by means of which it has been imagined that the breed might be preserved even in England. At this very period, it is

well known that the Spanish proprietors will not be persuaded but that the race of merinos degenerates in every part of the world, except the particular places in which its celebrity originated. Actual experience has, however, taught the agriculturists of England, and France, that the contrary is the case. The same observation may, in course of time, be applicable to the race of Angora goats.

GOBELINS, a famous manufactory established in the suburbs of St. Marcel, at Paris, for making tapestry and other furniture.

The house in which this manufacture is at present carried on, was built by the brothers named Gobelins, who were celebrated dyers in the 15th century, and who first introduced into Paris that beautiful scarlet-colour which has since borne their name, as has the little river Bièvre, upon whose banks they first settled, and which among the Parisians has no other appellation than *Rivière des Gobelins*. Colbert purchased the ground from these brothers, for the purpose of establishing there a manufactory of tapestries, similar to those of Flanders, and having erected the requisite buildings, he procured a number of workmen from Flanders. The manufacture of tapestries commenced in 1663, but did not flourish till 1666, when it was endowed with many privileges, one of which was that the freedom of the goldsmiths, cabinet-makers, watch-makers, joiners, and other companies, should be attached to the Gobelins manufactory, in which it was intended to bring up sixty youths to these different trades. At length the celebrated painter Le Brun was appointed chief director of the Gobelins manufactures, to which he communicated that beauty and energy which his admirable talents were so well calculated to introduce. One of the first steps taken was to procure a considerable number of paintings by the first masters; but it was not then foreseen that the method used in making the tapestries caused the destruction of their valuable models: the paintings were, at that time, cut into parts, to which the warp was so applied that the threads of the one matched the tints of the other. The raised tapestry, rendering copies closely approaching the originals, was far more faithful than the smooth. The smooth tapestry had the same destructive effects on its models, and its copies were all reverses. The original being placed under the warp, could only be discerned by the artist between the threads, and from the horizontal position of the work, that frequent comparison of the copy with the original could not so readily be made as in working the raised tapestry. The Gobelins manufactory at one time experienced a decline; divers abuses crept into it, and called for the interference of the ministry, who remedied them, and endeavoured to revive the establishment

(which had cost the nation vast sums of money) to its former flourishing state: for this purpose many committees were held at the house of M. Fagon, financier, in 1737; where the plan was projected which has since been followed, of transferring the tints of the painting to transparent paper, which was applied to the warp in the same manner as the model itself had been. At first, this method was only adopted to the raised tapestry, but in 1749 the new plan was applied to the manufactures of the smooth tapestry likewise. The following is the mode of procedure now employed. The sketch of the painting is taken off on oiled paper, which being then placed under the warp, serves as a guide to the artist, who, having the original painting in view, matches it by a correct choice of tints. The sketch on the oiled paper being *reversed* from the original, exactly answers the purpose of the artist, whose work becomes a counter-proof of that on the paper. There has always been an academy within the manufactory, in which the youths designed for artists are instructed in the various branches of the art, at the expense of the nation, and are also taught the other trades attached to the Gobelins. The wool, and silk, used in the tapestries are dyed in a part of the manufactory appropriated to that purpose, as it would be otherwise very difficult to procure the infinite variety of tints and shadows which are required. The materials are, the ready spun wools brought from Tuscoing; and the silks of Lyons. The wool for the warp is generally composed of six or seven threads; and worth about five francs (about 4s. 4d.) per lb. The wool in six threads forms the warp of the *smooth*, and that in seven of the *raised* tapestry; nevertheless, there is little or no difference in the quality, for the continued friction of the tapestry, and that of the instruments by which it is raised, reduce the substance of the warp so much, that it is oftentimes obliged to be strengthened by a silken thread. The manufacture of Flemish tapestries at Brussels, so ancient and celebrated, is, at present, as capable of perfection as ever, but its productions are much inferior to those of the Gobelins, and experience a decrease of their former reputation. The materials used in the Flemish fabric are equal to those of the Gobelins, both in quality and quantity, and the workmen of both are equally diligent; but the talents of the artists, and the influence of authoritative protection, are in favour of the Parisian establishment. A manufactory on the plan of the Gobelins has been established at Petersburg; and is supported at a great expense by the government, which receives the profits arising from the sale of its produce: this manufactory has produced some very fine portraits. In Spain, and in several parts of Italy and Germany, similar manufactures have been established, but with indifferent success; that at Turin is the most

flourishing. In 1775 there was worked at Turin a species of tapestry representing the principal events of the life of the Carthaginian general, Hannibal, beginning with that of his swearing enmity to the Romans, and ending with the catastrophe of his death by poison. The best of these is that representing him when surrounded by the Romans in a valley, employing the stratagem of tying lighted faggots to the horns of oxen, in order to scare the Roman soldiers, who guarded the defiles. In this piece the figures have considerable expression, and the warmth of the original painting is exceedingly well preserved. The Gobelins manufacture in France suffered considerably by the Revolution; and particularly that branch which derived a profit from the dyeing of scarlet cloths, being then little worn in France. There are other colours dyed in the Gobelins, which, though inferior to the scarlet, are nevertheless very fine.

An attempt was made, under the patronage of Frederick Prince of Wales, father of his present majesty, to introduce this manufacture into England: but the expenses of it were found to be so considerable, that it was abandoned. Neither, indeed, was it understood that the demand for it, among the British nobility and men of wealth, was likely to be so general as to render it an object of national effort. The process is extremely slow and tedious; the purchase is very heavy, and almost restricted to princes; and, when a palace is once furnished with it, the future employment of the loom is diminished in proportion. Under all these preventive circumstances, an institution to rival the Gobelins was relinquished.

GOLD. (GER. *Gold*. DU. *Goud*. DA. & SW. *Guld*. FR. *Or*. IT. & SP. *Oro*. PORT. *Oiro*, *Ouro*. RUS. *Soloto*. POL. *Zloto*: LAT. *Aurum*.) Gold is a metal of a yellow colour, in specific gravity next to platina, possessing great lustre, malleability, and ductility. It has no perceptible taste or smell. Its specific gravity 19.3. It may be beaten out into leaves so thin that one grain of gold will cover $56\frac{3}{4}$ inches. These leaves are only 1.28200th of an inch thick, but the gold-leaf with which silver-wire is covered has only 1-12th of that thickness. An ounce of gold, upon silver-wire, is capable of being extended more than 1300 miles in length. Its tenacity is considerable, though in this respect it yields to iron, copper, platinum, and silver. From the experiments of Sickingen, it appears that a gold-wire 0.078 inches in diameter is capable of supporting a weight of 150.07 lbs. avoirdupois, without breaking. When melted, it assumes a bright blueish-green colour. It expands in the act of fusion, and consequently contracts while becoming solid more than most metals; a circumstance which renders it less proper for casting in moulds. It requires a very violent heat to

volatilize it; it is, therefore, to use a chemical term, exceedingly fixed.

Europe is mostly supplied with gold from Chili and Peru, in South America; though a small quantity is likewise imported from China, and the coast of Africa. This metal is also found in the sands of several large rivers, which do not spring from the mountains, but contain veins of gold. Mines of gold-ore are known to exist in many parts of Europe, and have been attributed by conjecture to many others, of which Ireland presents an example.

Exclusive of gold being employed as a circulating medium, it is used in various manufactures, as chains, watches, plates, &c. &c. It may be taken up from its solution in aqua-regia by ether, in the same way as platina, and thus used for gilding steel, silver, &c.

It is precipitated from the same solution by tin, in the form of a purple powder, called the *Purple Powder of Cassius*, which is used to communicate that colour to glass and porcelain, and for painting in enamel.

Gold amalgamates with mercury, forming a liquid substance, and is applied in this manner for gilding, called *water-gilding*; the mercury is driven off by heat, leaving the gold distributed over the substance to which the solution had been applied.

Gilding by *friction* is performed by first immersing linen rags in a solution of gold in aqua-regia, and then burning them; minutely divided particles of gold thereby incorporate with the charcoal of the rags, which are to be applied to the end of a cork, and rubbed on the substance to be gilded.

Leaf-gold ground very fine, and mixed with honey, is used in miniature painting: it is usually sold under the name of, gold in the shell.

The relative value of gold to that of silver was anciently as *twelve to one*. This proportion, however, varies according to the scarcity or abundance of the former metal. The value of fine gold in our coinage is to that of silver, as $15\frac{1}{2}$ to 1. A similar proportion may be considered as the average standard throughout Europe.

There are various methods for determining the fineness of gold, or the proportion of alloy which it contains. What are termed touch-needles are generally employed for this purpose, by means of which the respective quality of gold may be ascertained with tolerable accuracy.

These needles are small bars made of compound metals, in different proportions, which are accurately marked on each, and by rubbing the metal under examination, and one or more of the needles close to each other on a *touch-stone*, the different strokes are compared, in order to judge by the colour of that which bears the strongest resemblance to that of the doubtful metal: the most usual

stones for this test are black basaltes, though either flint or potter's-ware may be employed with equal advantage

An expert goldsmith, besides the colour of the metal, will also attend to other concomitant circumstances, as, whether it be rough, dry, smooth, or greasy.

As, however, several metallic substances yield marks very similar to gold, a further test becomes necessary, which may be effected by applying a drop of aqua-fortis to the suspected metallic marks on the stone, and if they do not disappear from this application, it may be concluded that the gold is genuine.

GOLD-BEATERS' SKIN, the intestinum rectum of an ox, which gold-beaters lay between the leaves of their metal while they beat it, whereby the membrane is reduced thin, and made fit to apply to cuts or small fresh wounds.

GOLD-BEATING. Gold-beaters first melt a quantity of pure gold, and form it into an ingot: this they reduce by forging into a plate about the thickness of a sheet of paper; which done, they cut the plate into little pieces about an inch square, and lay them in the first or smallest mould to begin to stretch them; after being hammered here a while with the smallest hammer, they cut each of them into four, and put them into the second mould to be extended further. Upon taking them hence, they cut them again into four, and put them into the third mould, out of which they are taken, divided into four as before, and laid in the last or finishing mould, where they are beaten to the degree of thinness required.

The leaves thus finished, they take them out of the mould, and dispose them in paper books, prepared with a little red bole for the gold to stick to: each book ordinarily contains 25 gold leaves. There are two sizes of these books: 25 leaves of the smallest only weigh 5 or 6 grains, and the same number of the largest, 9 or 10 grains. Gold is beaten more or less, according to the kind or quality of the work it is intended for; that for the gold wire-drawers to gild their ingots with is left much thicker than that for gilding the frames of pictures, &c. See **GILDING**

GOLD, Burnished, that which is smoothed or polished with a burnisher.

GOLD, Mosaic, that which is applied in pannels, or proper ground, distributed into squares, lozenges, and other compartments, part whereof is shadowed to heighten or raise the rest.

GOLD, Pure, that purged by fire of all its impurities, and all alloy. It is frequently called gold of 24 carats, but there is no such thing as gold so very pure, and there is always wanting at least a quarter of a carat. Gold of 22 carats has one part of silver, and another

of copper; that of 23 carats has half a part; i. e. half a twenty-fourth of each.

GOLD, Shell, that used by the illuminers, and with which we write gold letters. It is made of the parings of leaf-gold, and even of the leaves themselves. See **GILDING**.

GOLD-THREAD, or *Spun-gold*, is a flatted gold, wrapped or laid over a thread of silk, by twisting with a wheel and iron bobbins.

The method of forming gold-wire and gold-thread, both round and flat.—First, an ingot of silver, of 24 pounds, is formed into a cylinder, of about an inch in diameter; then it is drawn through eight or ten holes, of a large wire-drawing iron, both to finish the roundness, and to reduce it to about three-fourths of its former diameter. This done, they file it very carefully all over to take off any filth remaining from the forge; they then cut it in the middle: and thus make two equal ingots, each about 26 inches long, which they draw through several new holes, to take off any inequalities the file may have left, and to render it as smooth and equal as possible. The ingot thus far prepared, they heat it in a charcoal fire; then taking some gold-leaves, each about four inches square, and weighing twelve grains, they join four, eight, twelve, or sixteen of these, as the wire is intended to be more or less gilt; and when they are so joined as only to form a single leaf, they rub the ingots reeking-hot with a burnisher. These leaves being thus prepared, they apply over the whole surface of the ingot, to the number of six, over each other, burnishing or rubbing them well down with the blood-stone, to close and smooth them. When gilt, the ingots are laid anew in a coal-fire; and when raised to a certain degree of heat, they go over them a second time with the blood-stone, both to solder the gold more perfectly, and to finish the polishing. The gilding finished, it remains to draw the ingot into wire. In order to this, they pass it through 20 holes of a moderate drawing-iron, by which it is brought to the thickness of the tag of a lace; from this time the ingot loses its name, and commences gold-wire. Twenty holes more of a lesser iron leave it small enough for the least iron; the finest holes of which last, scarcely exceeding the circumference of a hair of the head, finish the work. To dispose the wire to be spun on silk, they pass it between two rollers of a little mill; these rollers are of nicely polished steel, and about three inches in diameter. They are set very close to each other, and turned by means of a handle fastened to one of them, which gives motion to the other. The gold-wire in passing between the two is rendered quite flat, but without losing any thing of its gilding, and is rendered so exceedingly thin and flexible, that it is easily spun on silk thread, by means of a hand-wheel, and so wound on a spool or bobbin.

GOLD-WIRE, a cylindrical ingot of silver, superficially gilt, or covered with gold at the fire, and afterwards drawn successively through a great number of little round holes, of a wire-drawing iron, each less than the other, till it is sometimes no bigger than a hair of the head. Before the wire is reduced to this excessive fineness, it is drawn through above 140 different holes, and each time they draw it, it is rubbed afresh over with new wax, both to facilitate its passage, and to prevent the silver appearing through it.

GOLD-WIRE, *Flatted*, is the former wire flatted between two rollers of polished steel, to fit it to be spun on a stick, or to be used flat, as it is without spinning, in certain stuffs, laces, embroideries, &c.

GOLD-LEAF, (GER. *Blattgold*. DU. *Bladgould*. DA. *Bladguld*, *Bogguld*. SW. *Bladguld*, *Bokguld*. FR. *Or en feuilles*, *Or battu*. IR. *Oro in foglia*. SR. *Oro batido*, *Paanes de oro*. PORT. *Ouro batido em folhas*. RUS. *Listowoe soloto*. POL. *Blat*, *Zloto platkowe*. LAT. *Aurum foliatum*.) the thin leaf used in gilding. See **GOLD-BEATING** and **GILDING**.

GOLD, DUTCH. See **ORSIDUE**.

GOLD and SILVER WIRE-DRAWER. See **GOLD-WIRE**.

GOLDEN ROD, or **WOUND WORT**, an indigenous perennial plant, the leaves and flowers of which, according to Bechstein, yield a beautiful yellow colour, even superior to that obtained from woad.

GOLDSMITH, or **SILVERSMITH**, as called by some, an artist who makes vessels, utensils, and ornaments in gold and silver. The goldsmith's work is either performed in the mould, or beaten out with the hammers and other engines. All works that have raised figures are cast in a mould, and afterwards polished and finished: plates or dishes of silver or gold are beaten out from thin flat plates; and tankards, and other vessels of that kind, are formed of plates soldered together, and then mouldings are beaten, not cast. The business of the goldsmith formerly required much more labour than it does at present; for they were obliged to hammer the metal from the ingot to the thinness required; but the flattening-mills now in use reduce metals to any thinness, at a very small expense. The goldsmith is to make his own moulds, and for that reason ought to be a good designer, and have a taste in sculpture; he also ought to know enough of metallurgy to be able to assay mixed metals, and to mix the alloy. See **ASSAYING**.

The goldsmiths employ several hands under them for the various articles of their trade; such are the jeweller, the snuff-box and toy-maker, the silver turner, the gilder, the burnisher, the chaser, the refiner, the gold-beater, &c.

Goldsmiths are superior tradesmen : their wares must be assayed by the wardens of the company of this name in London, and marked; and gold is to be of a certain touch. No goldsmith may take above one shilling the ounce of gold, besides what he has for the fashioning, more than the buyer may be allowed for it at the king's exchange; and here any false metal shall be seized and forfeited to the king. The cities of York, Bristol, Exeter, &c. are places appointed for the assaying wrought plate of goldsmiths; also a duty is granted on silver plate of sixpence an ounce, &c.

Plate made by goldsmiths shall be of a particular fineness, on pain of forfeiting 10*l*. and if any parcel of plate sent to the assayers is discovered to be of a coarser alloy than the respective standards, it may be broken and defaced; the fees for assaying are particularly limited.

GOLTSCHUT, a sort of money, or rather a small ingot of gold, that comes from China, and is considered there rather as a commodity, than as current specie; the Dutch give it this name, signifying in their language a golden boat, on account of its shape, though other nations call it gold cake. As neither in all China, nor Tonquin, any gold or silver money is struck, the natives cut these two metals into bits of divers weights, calling the silver ones *taels*, and the gold ones *goltschuts*. The latter serve in large payments, when the tael and copper money are insufficient. There are two sorts, the one of 32½ oz. and the other half that weight. When the Chinese transport their goltschuts into different parts of India, where they trade, the merchants they deal with commonly cut them in halves, as the Chinese are so fraudulent as often to line these gold cakes with either copper, or silver, to one-third of their real value. The Japanese have also *goltschuts* of silver only, which being of various weights, are of different value.

GONDOLA, a flat boat, very long and narrow, chiefly used at Venice to row on the canals. The middle-sized gondolas are upwards of 30 feet long, and four broad; they always terminate at each end in a very sharp point, which is raised perpendicularly to the full height of a man. The address of the Venetian gondoliers, in passing along their narrow canals, is very remarkable: there are usually two to each gondola, and they row by pushing before them. The fore man rests his oar on the left side of the gondola: the hind man is placed on the stern, that he may see the head over the tilt or covering of the gondola, and rest his oar, which is very long, on the right side of the gondola.

Gondola is also the name of a passage-boat of six or eight oars, used on other parts of the Italian coast.

GOOSE-NECK, in a ship, a piece of iron fixed on the end of the tiller, to which

the laniard of the whip-staff, or the wheel-rope comes, for steering the ship.

GOOSE-WING, in the sea language. When a ship sails before, or with, a quarter wind on a fresh gale, to make the more haste, they launch out a boom, and sail on the lee-side: and a sail so fitted is called a *goose-ming*.

GOODS implies every species of merchandise, wares, or freights.

GOREING, in the sea language, signifies sloping. A sail is cut goreing when it is cut sloping by degrees, and is broader at the clew than at the earing, as all top-sails and top-gallant sails are.

GOUGE, (*Gouges*. GER. *Hohlmeissel*, *Hohlbetels*, *Güdsen*. DU. *Gudsen*. DA. *Huulmeisel*, *Huuljern*. SW. *Halkjern*. FR. *Gouges*. IT. *Gorbie*. SP. *Gubias*. PORT. *Goivas*.) an instrument or tool used by divers artificers; being a sort of round hollow chisel, for cutting holes, channels, grooves, &c. either in wood or stone.

GOURDS. See COLOCYNTHIS.

GRACE, *Act of*, an act of parliament for a general and free pardon, and for setting at liberty insolvent debtors.

GRACE, *days of*, a certain number of days allowed for the payment of a bill after the written term is expired. In Great Britain there are three days of grace allowed upon every bill, whether foreign, or domestic; or drawn after sight, or date, and upon every promissory note; but if the last of the three days happen to fall on a Sunday, the bill becomes payable on the preceding day. It is doubtful whether days of grace are to be allowed on bills payable *at sight*. The weight of authority seems in favour of such an allowance. *Selw. N. P. 4th ed.* 339. *Chitty on Bills, 5th ed.* 345. The following days are allowed in the chief commercial cities of Europe: —

Amsterdam	6 d.	Lyons	0 d.
Antwerp	6	Madrid	14
Bremen	8	Milan	0
Cadiz	6	Naples	3
Cologne	6	Paris	10
Copenhagen	8	Petersburgh	0
Dantzick	10	Rio Janeiro	6
Dublin	3	Rome	0
Geneva	5	Rotterdam	6
Genoa	30	Sicily	0
Gibraltar	14	Stockholm	6
Hamburg	12	Switzerland	0
Leghorn	0	Turin	5
Leipsic	0	Venice	6
Lisbon	6	Vienna	3
London	3		

GRAIN, signifies the fruit or seed growing in a spike or ear, in which sense it comprehends every species of corn, as wheat, rye, barley, oats, &c.

GRAIN, a small weight, the 20th part of a scruple in apothecaries' weight, and the 24th part of a pennyweight troy. A grain weight of gold bullion is worth about two-pence, and that of silver but half a farthing.

GRAIN, also, denotes the component particles of stones and metals, the veins of wood, &c. Hence cross-grained, or against the grain, is contrary to the fibres of the wood, &c.

GRAINING-BOARD, among curriers, an instrument called also a pummel, used to give a grain to the leather.

GRAINS, are the refuse of malt which has been brewed or distilled. Immense quantities of this article are consumed at London and in its vicinity, for the feeding of pigs. Cow-keepers in the environs of the metropolis feed their cows with grains, which renders their produce of milk extremely abundant, though of inferior quality.

GRAINS OF PARADISE, (GER. *Paradies-körner*. DU. *Guinees green*. DA. and SW. *Paradiskorn*. FR. *Graines de Paradis*, *Maniguette*, *Malaguette*. IT. *Meleghetta*. SP. *Malagueta*, *Grana del Paraiso*. PORT. *Malaguetta de Guine*, *Grãce do Paraizo*. RUS. *Raiskie ziarnka*. LAT. *Grana Paradisi*, *Cardamomum majus*.) are the greater cardamoms. They are more pungent, but less agreeably aromatic, than the lesser cardamoms, and are rarely, if ever, used, except by farriers. Grains of Paradise are brought to us from the East Indies, and from the coast of Africa, where they are grown in abundance.

GRAMPUS, a fish of the cetaceous or whale kind. It is met with in the northern seas, and is said to yield abundance of oil.

GRANITE, (GER. and FR. *Granit*. DU. and DA. *Granitsteen*. SW. *Granit*, *Grästen*. IT. *Granito*. SP. *Granites*.) a very hard rough kind of stone, that will not take a thorough polish, so denominated, as being sprinkled over with a great many little stains that resemble grains of sand. There are three sorts of it, 1. That of Egypt, with greenish spots on a dirty white ground, chiefly used by the Egyptians in building obelisks and catacombs, some of which are above 40 feet high. 2. The granite of Italy, which is softer in the quarry than that of Egypt. 3. The granite of Dauphiny, which is only a very hard sort of flint. There is likewise a green sort of granite, which is a species of serpentine, variegated with white and green specks. The common granite of Great Britain is generally employed as pavement for streets, steps for the entrances of public buildings, &c. This latter sort is a pale whitish granite, variegated with black and yellow; it is found in strata in Cornwall, in Scotland, and other parts of the kingdom. The finest specimens of the different kinds of British granite are to be seen in the newly-erected Waterloo Bridge in the metropolis.

GRAPES, (GER. *Trauben*. DU. *Ducigen*. DA. *Druer*. SW. *Druvfor*. FR. *Raisins*. IT. *Grappoli*, *Grappi*. SP. *Uvas*, *Racimos*. PORT. *Uvas*. RUS. *Winograd*. POL. *Grona*. LAT. *Uvæ*.) a well-known

fruit produced from the vine, whose colour, when ripe, is either red or green. France, Spain, Portugal, and Italy, as well as some parts of Germany and Hungary, produce grapes capable of yielding wines of various qualities and flavour, which may justly be considered the richest gift that Providence has bestowed upon these countries. We import vast quantities of green grapes from Malaga and some other parts of Spain; whence they are brought to us packed in jars, and secured from damage by means of saw-dust, which is plentifully strewn in the jars between the layers of fruit. The grapes grown in Great Britain are much smaller, and by no means so luscious as those of foreign countries. Grapes are imported from Spain, &c. not only in their natural state, but dried and preserved, in which latter state they are denominated raisins. See WINE. RAISINS.

GRAPNELS, a sort of anchors with four flooks, serving for boats to ride by. There is also a kind called fire and chain-grapnels, made with four barbed claws instead of flooks, and used to catch hold of the enemies' rigging, or any other part, in order to board them.

GRATINGS, in a ship, a kind of lattice-work formed of ledges and battens, the square holes of which being three or four inches wide, are for the current footing of men over hatchways, to give air below, and vent for the smoke in an engagement.

GREAT-CIRCLE SAILING, the manner of conducting a ship in, or rather pretty near, the arch of a great circle, that passes through the zenith of the two places, viz. whence she came, and to which she is bound.

GREENLAND FISHERY. See title FISHERY.

GREEN-VITRIOL, is formed of sulphuric acid and iron, and is the green copperas of the shops. See COPPERAS and VITRIOL.

GREWT, among miners, signifies earth of a different colour from the rest, found on the banks of rivers as they are searching for mines.

GRIMELIN, a small silver coin, made and current at Tripoli in Barbary, value about four sols Tournois, or about 2d. sterling.

GRIPE, in the sea language, a piece of timber stayed against the lower piece of the stern, from the foremast end of the keel, joining with the knee of the head: its use is to defend the lower part of the stern from any injury; but it is often made the larger, to make the ship keep a good wind.

GRIND-STONE, or **GRITT-STONE**, (GER. *Schleifstein*. DU. *Slypsteen*. DA. *Slibsteen*. SW. *Brynsten*, *Slipsten*. FR. *Meule*, *Queaz*. IT. *Mola*, *Cotè*. SP. *Muela*, *Piedra de amolar*. PORT. *Pedra d'amolar*, *Rebola*. RUS. *Bruskü kamenië*. POL. *Osla*. LAT.

Cos.) a stone consisting of sand agglutinated together. Its properties differ according to the fineness or coarseness of its grain, and the firmness of its texture. Some kinds are pounded to convert them again into sand; others are used for building, others for grinding edge-tools, and others for filtering water.

GRIST, denotes corn ready for grinding.

GROAT, an English money of account, equal to four-pence. Other nations have their groots, grotes, or gros, but of various values, and not corresponding with that of the English groat. See **MONIES**, App. In the time of the Saxons our largest silver money was a penny, which continued so till 1351, when Edward III. coined *groats*; and thus matters stood, till Henry VIII. in 1504, first coined shillings.

GROCER. This tradesman mostly deals in tea, sugar, coffee, chocolate, spices, and dried fruits, as raisins, currants, prunes, figs, &c. He buys the goods from the importer, and his profits arise from his buying and selling prices. By 37 Ed. 3. c. 5. grocers (which was a corruption of Engrossers) were merchants that engrossed all vendible merchandise; but now it is a particular and well-known trade, incorporated into a company.

The following are the chief regulations for persons in this trade, and the penalties for the adulteration of teas, &c.

Dealers in coffee, tea, and cocoa-nuts, are to take out a licence annually, on penalty of 20*l.* to be renewed ten days before the expiration of such licence. See **LICENCES**.

The words *Dealer in Tea, &c.* to be placed over the doors of such dealers, under penalty of 200*l.* and not having made entry at the excise-office, to forfeit 50*l.* 19 Geo. 3. c. 69.

Dealers of tea purchasing of any person other than a dealer, having the words *Dealer in Tea, &c.* painted over his door, except from the original warehouse, or at the sales of the East India Company, the customs, excise, or sales of salvage, shall incur a penalty of 100*l.*

Publicans, or dealers in brandy, having above six pounds of tea, coffee, or cocoa-nuts, in their custody, are deemed sellers thereof, and subject themselves to the survey of the excise, and to all the penalties of dealing without a licence.

All dealers, before they receive any of the above articles into their custody, must make entry, in writing, at the next office of excise, of their warehouses, shops, &c. for keeping such articles, under penalty of 200*l.*

No tea, coffee, cocoa-nuts, &c. to be exposed to sale, in any unentered shop, under penalty of forfeiture thereof, and treble value for the same; and for tea so exposed to sale, the penalty is 10*l.* exclusive of the forfeiture of the article.

Every dealer in tea, coffee, or cocoa-nuts, must enter every night in a book all such

quantities as are sold or consumed in the day in quantities under six pounds, and in another book, all quantities sold in the day, in quantities above six pounds, under penalty of 100*l.*

No more than one entry-book to be allowed at one time of each sort, and distinct accounts of the consumption of black and green must be entered, under a similar penalty.

The entry-books must be open to the inspection of officers; and, when filled up, must be returned upon oath, under penalty of 100*l.*

Any tea-dealer, upon oath, or upon suspicion, may be summoned by two commissioners in London, or one magistrate in the country, to make oath to his entry-book, under penalty of 20*l.*

Tea-dealers selling above six pounds are entitled, upon application, to a permit, or certificate, to protect the same from seizure on removal, such permit specifying distinctly the quantity and quality of black and green tea.

Such permits must also specify the time during which they are to remain in force, as well whilst removing from the stock of the person, as whilst they are delivering into the stock of the person to whom such articles are sent.

All teas, &c. not received into the stock of the person to whom they are removing, during the time limited in the permit, are to be considered as removed without permit; but upon application and proof of unavoidable delay, the party may be relieved, and the goods be restored.

Dealers taking permits, and not sending away the goods within the time limited, to forfeit treble value, together with such goods, if upon taking stock there shall not appear a sufficient decrease to answer to such permits.

The duties to be paid before the teas, &c. shall be taken out of the warehouses.

All dealers in tea are to distinguish such teas by the names *black* or *green*. Black comprehends bohea, congou, souchong, and peko; green, every other sort.

All dealers are to mark their canisters or packages with words, *Black* or *Green Tea*, according to the sort of the tea contained in each.

Dealers are to deliver to the officers samples of that identical tea intended to be removed by permit, not exceeding two ounces.

Dealers manufacturing leaves in imitation of tea, or mixing or colouring such leaves, or having in their custody, or offering for sale any dyed or manufactured leaves, or tea mixed therewith, are liable to a penalty of 10*l.* for every cwt.

Persons altering, adulterating, or fabricating tea with *terra japonica*, or other drug, or mixing tea with other leaves or ingredients, incur a penalty of 100*l.* and forfeiture.

Dyeing or manufacturing of leaves in imitation of tea or tea-leaves, or mixing such tea with *terra japonica*, copperas, &c., or selling, or exposing to sale, or having in their custody, any such leaves, shall forfeit 5*l.* for every pound thereof, or, in default of such payment, be committed for not more than twelve, nor less than six months.

Dealers in tea, having in their custody *above six pounds* of ash, elder, or other leaves, green or manufactured, not proving such were gathered with consent of the owners of such trees, and what uses they are intended for, other than fabricating imitations of tea, incur a penalty of 5*l.* for every pound.

Leaves dyed or fabricated in imitation of tea, suspected to be concealed, may, by day, (or by night, with a constable,) be searched for, and seized by a warrant of one magistrate.

Tea-dealers having an increase in their stock beyond what was found by the officer in his last survey, such increase shall be deemed to be brought in without permit, and be forfeited, and such dealer shall incur the penalty of 20*l.*

Dealers fraudulently concealing tea, coffee, or cocoa-nuts, shall forfeit the same, and treble the value.

All goods liable to forfeiture are seizable on board a ship by any officer of the customs or excise.

No dealers to bring in coffee, tea, or cocoa-nuts, without giving notice, and producing an authentic permit or certificate to the proper officer, under forfeiture of the goods, and treble their value.

No tea, &c. to be delivered out of the warehouses for home consumption, but upon producing a warrant of the inland duty being paid, nor to be delivered out of warehouses for home consumption without a permit granted by the warehouse-keeper, and signed by the officers of excise.

If any tea, coffee, &c. be delivered out by warehouse-keepers illegally, they shall forfeit their employ and 100*l.* penalty.

Counterfeiting, forging, or fraudulently altering or erasing any permit or certificate, or knowingly receiving, publishing, or using any counterfeited, forged, false, untrue, altered, or erased certificate or permit, incur a forfeiture of 500*l.*

Dealers must permit officers at all times (by day) to enter and take an account, under forfeiture of 100*l.* and obstructing or molesting officers in seizing tea, coffee, or cocoa-nuts, or rescuing, or staying and destroying the goods, or attempting either, after the same are seized, incurs a penalty of 50*l.*; but if searched for, and seized under a warrant, the penalty is 100*l.*

When the coffee or cocoa-nuts are seized, the proof of payment of the duty shall lie on the claimant.

All teas imported (except by the East India Company) must be entered with the excise, and landed within 30 days after the same is reported, under penalty of forfeiture thereof.

Leaves green or manufactured, found in the custody of any person, suspected to be for the purpose of fabricating any imitation of tea, are to be seized and burned, unless the owners prove, within 24 hours, that they were gathered with the consent of the proprietor of the teas, and for other uses than are there mentioned.

Leaves dyed or manufactured in imitation of tea, and found in the house, garden, or land, of any person, are deemed to be in his custody, if there lodged with his consent and privity.

All tea above six pounds found removing at any hour, except between seven o'clock in the morning, and five in the evening, from the 29th day of September to the 25th day of March, or between five in the morning, or seven in the evening, from the 25th day of March to the 29th of September, (except in a known stage-coach or waggon, usually travelling out of those hours,) with or without permit, shall be forfeited, together with the cattle or carriage employed therein.

Any dealer receiving tea with permit may return the same, or any part thereof, within 24 hours after, upon giving 12 hours' notice to the officer, stating the cause of such return, and signing his own name, and adding the name of the person to whom the same is returned on the package, with the words *Returned Tea*.

Tea (any quantity except such as is returned under the legal regulations) removed from without to within the bills of mortality, with or without permit, shall be forfeited, with the vessels, boats, horses, and carriages, employed in removing the same.

Tea seized by any officer of the customs, if afterwards removed without an excise permit, may be re-seized.

All teas seized by officers of excise in any part of England, must be sent to London with permit, and there publicly sold.

By 48 Geo. 3. c. 84. and 50 Geo. 3. c. 41. hawkers offering tea for sale, even though they have a permit, are subjected to heavy pecuniary penalties, to a forfeiture of their respective licences; if seamen, to be impressed into the service, and to future incapacities.

Dealers in cocoa-nuts are to keep an account of all sold and delivered in parcels above 28lb. or upwards, and of the name and place of abode of the persons to whom the same is sold and delivered, and shall permit officers to take copies thereof, on penalty of 20*l.*

Private persons might roast coffee at their own houses, but not for sale. But by 49

Geo. 3. c. 80. dealers in coffee may roast their own coffee, making due entry at the next excise office. Roasting without such entry, a penalty of 50*l*.

Coffee is not to be roasted with, nor the weight increased by butter, water, or grease, &c.; nor shall any dealer knowingly buy any coffee so mixed, on penalty of 100*l*.

Coffee seized in any part of England must be brought to and publicly sold in London.

Samples may be taken of coffee and cocoa-nuts, not exceeding four ounces weight, and not more than three samples to be taken out of one cask; and upon taking a second, the first to be returned, or in lieu thereof, a quantity of good coffee, equal in weight to such sample.

Coffee and cocoa-nuts may be delivered from the warehouses for home consumption, on production of a certificate of the payment of the duties, but not in less quantities than an entire cask, bag, or other package, in which the same was imported or repacked, when first weighed, nor in any less quantity than 112 lbs. at least, under penalty of 50*l*.

Warehouse rent to be paid to the proper officer of excise, before delivery of the coffee or cocoa-nuts, after the rate of 1*s*. per week the ton weight.

Coffee or cocoa-nuts deposited in warehouses may be sold for payment of duties if not cleared, and duties paid in three years any surplus to be paid to the proprietor.

Commissioners of the customs may permit coffee or cocoa-nuts to be received from the port of importation, to be conveyed to any other port in England, for exportation.

Any commodity manufactured in imitation of coffee, found in the possession of any dealer in coffee, shall be forfeited, and the dealer in whose custody the same is found incurs a penalty of 100*l*. 43 Geo. 3. c. 129. But by 3 Geo. 4. c. 53. persons not being dealers in coffee, may sell roasted corn, peas, &c. under certain regulations.

Any person is at liberty to make chocolate from cocoa-nuts which have paid the duty; but it must be in certain quantities, and under certain regulations. See 10 Geo. 1. c. 10.

Dealers in chocolate shall forfeit 20*l*. if they sell any chocolate in less quantities than $\frac{1}{4}$ lb.; and shall make entry with the excise-officer of all chocolate manufactured by them respectively, under a penalty of 50*l*. See 10 Geo. 1. c. 10. and 32 Geo. 2. c. 10.

GROCERY, (GER. *Spezereyen*, *Materialwaaren*. DU. *Specerijen*. DA. *Specerie*, *Krydderie*. SW. *Speceri*, *Kryddor*. FR. *Epicerie*, *Epices*. IT. *Spezi*, *Spezierie*. SP. *Especies*, *Especerías*. PORT. *Especies*, *Especiaria*. RUSS. *Pränite Korenja*. POL. *Korzenie*.) consists of those kinds of goods usually sold by grocers. See **GROCER**.

GROGRAM, (GER. *Grobgrün*. DU. *Grofgrein*, *Grein*. DA. and SW. *Grofgrün*. FR. *Gros-grain*. IT. *Grossograna*, *Groggrano*. SP. *Gorgoran*. PORT. *Grossagrana*, *Gorgoran*.) a kind of stuff, made of silk and mohair, something coarser and thicker than taffety.

GROSS, signifies the quantity of twelve dozen of any thing.

GROSS-WEIGHT, the whole weight of merchandise, with the dust and dross; as also the bag, cask, chest, &c. wherein goods are contained. An allowance is usually made out of the gross-weight for tare and tret, &c. See **TARE**.

GROUND-TACKLE, a ship's anchors, cables, and in general whatever is found necessary to make her ride safe at anchor.

GROWAN, among the miners of Cornwall, a coarse gritty stone, of a greyish colour, which they are often obliged to dig through before they can reach the ore.

GRY, a measure containing 1-10th of a line. A line is 1-10th of a digit, and a digit 1-10th of a foot, and a philosophical foot $\frac{1}{3}$ of a pendulum whose diadromes, or vibrations, in the latitude of 45 degrees, are each equal to one second of time, or 1-60th of a minute.

GUAIAACUM, (GER. *Pockhalm*. DU. *Pockhout*. DA. *Pokkent*, *Fansostræ*. SW. *Pockenholts*, *Fransosenholts*. FR. *Gayac*, *Bois saint*. IT. *Guajaco*. SP. *Guagaco*. PORT. *Guajaco*. RUSS. *Bakant*. POL. *Guaiaik*. LAT. *Lignum vitæ*.) is a medicinal wood, extremely hard and solid, of a dense compact texture, and remarkably heavy; it consists of two parts, a central matter or heart, as it is called in trees, and an exterior one or blea: the centre part is extremely hard and ponderous, and is of a greenish-black colour, or else it is variegated. The external part is yellowish, or the colour of box-wood: this is covered, when we see the fragments of the branches entire, with a thin, but very firm and strong bark, of a woody texture, but composed of a multitude of thin plates or laminae, laid over one another; it is somewhat resinous, and is externally of a mixed greyish and greenish-black colour; within it is of a pale colour. The wood is of a fragrant smell; of an aromatic and pungent, but somewhat bitterish taste; the bark is of a more acrid taste, and more disagreeable to the palate. Guaiacum is an excellent medicine in obstructions, and many chronic cases. It gives great relief in rheumatisms, gout, &c. The bark is more powerful than the wood as a medicine.

Besides the wood and the bark of guaiacum, we have a resin of it known under the improper name of *gum guaiacum* in the shops. This is a solid but very friable substance, much resembling common resin, except in colour, which is of a dusky greenish

hue, and sometimes, though less frequently, of a reddish. It is very acrid and pungent to the taste, and when burnt, smells not unpleasantly, but much like the guaiacum wood. This is given in similar cases with the wood. We obtain guaiacum principally from the island of Jamaica, but it grows in all the West India islands, and in South America. Its very name is of Mexican origin.

GUDGEONS, in a ship, are the eyes drove into the sternpost, into which the pintles of the rudder go, to hang it.

GUESTE, a long measure used in some parts of the Indies, equal to about 1-5th of the Dutch aune or ell.

GUEZE, a long measure of Persia, for measuring stuffs, linen, &c. Of this measure there are two sorts in that kingdom, viz. the royal gueze, called also *gueze monkel-sers*, and the *gueze racourcie*, called simply gueze; this last being only $\frac{2}{3}$ of the other. The gueze monkelser contains two feet, ten inches and eleven lines of Paris, or 4-5ths of the French aune, so that five guezes make four aunes. In India is also used a long measure called *gueze*, which is near six lines shorter than that of Persia, or about one-seventieth of an aune less, though as the difference is so small it is seldom regarded.

GUINEA, an English gold coin. At first it was only at twenty shillings value: after that it rose to twenty-one shillings. It is so called from *Guinea* in Africa, because the gold of which the first guineas were struck was brought thence. A pound of gold is divided into forty-four parts and a half, each of which is equivalent to a guinea. By 8 Will. 3. c. 1. guineas and half-guineas may be imported.

GUINEA-PEPPER, see **CAYENNE-PEPPER**.

GUITAR, or **GUIARRA**, a musical instrument of the string-kind, with five double rows of strings, of which those that are bass, are in the middle, unless it be for the burden, an octave lower than the fourth.

GUM, (GER. *Gummi*. DU. *Gom*, *Gomme*. DA. and Sw. *Gummi*. FR. *Gomme*. IT. *Gomma*. SP. *Goma*. PORT. *Gomma*. RUS. *Gummi*. POL. *Guma*. LAT. *Gummi*.) is a concrete vegetable juice, of no particular smell or taste, viscous and tenacious when moistened, and wholly soluble in water; insoluble in alcohol or oils; burning in the fire to a black coal, without melting or inflaming, and not volatile in the heat of boiling water. Such are the qualities of pure gummy matter. Many of the articles commonly called *gums*, are combinations of that substance with resinous matter, and are properly termed *gum-resins*. Besides the qualities of gum, the latter substances consequently possess more or less of those of pure resin (see **RESIN**). For the sake of convenience, we shall treat of them in alphabetical order.

Ammoniacum, (GER. DU. DA. Sw. *Ammoniak*. FR. *Gomme ammoniacque*. IT. *Gomma armoniacea*. SP. *Goma armoniaca*. PORT. *Goma armoniaca*. RUS. *Ammoniak*. POL. *Amoniak*. LAT. *Ammoniacum gummi*.) is a gum-resin, brought to England in masses, which are made up of little lumps, internally of a white milky appearance, externally of a yellowish colour. We have no certain account of the plant from which it is obtained, but it is supposed to be a species of *ferula*; another species of which produces *assa-fetida*. The plant is said to grow in Nubia, Abyssinia, and the interior parts of Egypt. This gum is brought to the western parts of Europe from Egypt, and from the Red Sea, by some of the ships belonging to individuals trading to those parts.

It is only employed as a medicine; its properties are stimulant and expectorant.

Anime. This is nearly a pure resin, inflammable, and readily soluble in alcohol. There are two kinds, the oriental and occidental: the oriental is a dry resin, brought in large casks, and of a very uncertain colour, some being greenish, some reddish, and some of the colour of myrrh. The occidental is a yellowish-white, resembling frankincense in colour. Both kinds are used in perfumes, and in medicine externally.

Arabic, called also *Acanthium*; *gum lamac*; *gum Thebaicum*, and *serapionis*; and properly *gum acacia*. It exudes from the Egyptian acacia, or thorn-tree, whose fruit affords the inspissated juice of that name. It is brought to this country principally from the Levant. The best is in small irregular pieces, of a clear, transparent, pale yellowish colour, brittle, and shining in its fracture, and almost tasteless: dissolved in water, it forms a transparent tenacious mucilage; it is employed by dyers, calico-printers, &c. for suspending the heavier colours in water, and to improve their brightness, and in the preparation of silk, lawn, cambric, &c. In medicine, it is sometimes used as a demulcent. Plum and cherry tree gum nearly resemble it in their properties.

Assa-fetida, (GER. *Teufelsdrück*. DU. *Duivelsdrak*. DA. *Dyvelsdræk*. Sw. *Dyvelsträck*. FR. IT. & PORT. *Assa-fetida*. SP. *Asa-fetida*. POL. *Smrodzeniec*. LAT. *Asafetida*.) the concrete juice of the root of the *hingisêh*, or the *assa-fetida* plant. *Kæmpf. Amœnit. Exot.* It is brought in large masses from Persia and the East Indies. It is a compact, gummy, resinous substance, soft and pliable like wax while new, composed of various little shining lumps or grains, which are partly of a whitish colour, partly reddish, and partly of a violet hue. It smells like garlic, but much stronger, and has a bitter, acrid, biting taste. Those masses are best, which are clear, of a palish red, and variegated with a

great number of elegant white tears. When it first exudes from the wounded root, it is liquid and white, like milk; but upon being exposed to the air, it becomes of a brownish colour, and gradually acquires different degrees of consistency.

It is used in medicine as a powerful stimulant, particularly of the nervous system; it also possesses carminative and expectorant properties.

Bdellium, called also *madelon bolchon*, *balchus*, and by the Arabians, *mokel*, is a gum-resin, somewhat resembling myrrh in appearance, but rather darker, brought from the Levant, and from the East Indies. The resinous part is soluble in alcohol, and the gummy in water. Vinegar, or verjuice, dissolves it wholly. It is sometimes, though rarely, used as a medicine, for its stimulant and expectorant qualities.

Benzoë, or *Benjamin*, (GER. *Benzoë*. DU. *Benzoïn*, *Benjuin*. DAN. and SW. *Benzoë*. FR. *Benjoin*. IT. *Belgiuino*, *Belzoino*. SP. *Benjui*. PORT. *Bejoin*. RUS. *Ladon rossnoi*. POL. and LAT. *Benzoim*.) a solid, almost pure resin, brought to us in masses of various sizes from the East Indies, particularly from the kingdom of Siam, and the islands of Java and Sumatra. It is very brittle, and breaks vitreously. When rubbed it emits a fragrant odour, and when heated sufficiently, lets the benzoic acid escape. It is soluble in alcohol, but insoluble in water.

It is sometimes used internally as a stimulant and expectorant medicine, but more frequently as an external application in combination with storax, aloes, and balsam of Tolu, in the well-known composition termed *friars' balsam*, *jesuits' drops*, &c. It is also used as a perfume and cosmetic.

Copal. This gum-resin is obtained from a tree called *rhus copallinum*, a native of North America. The copal most preferred is brought from Spanish America. It is transparent, and of a bright brown colour. It melts when heated, but is not easily soluble in alcohol, or in oil of turpentine, and with difficulty in fixed oils. If copal be digested with oil of turpentine in a close vessel, from which the vapours are not allowed to escape, they exert a great pressure, which prevents the boiling of the turpentine, and thus the mixture may be made to acquire an higher temperature. A considerable portion of copal is thus dissolved, and with the addition of a little poppy oil, it forms an excellent varnish. Copal may be dissolved in alcohol, by first dissolving half an ounce of camphor in 16 ounces of alcohol; this solution is poured on four ounces of copal in a matress, which is stopped with a cork, and perforated with a pin. Heat is to be applied, and when the copal is nearly dissolved, the process is stopped, and the matress allowed to cool before the cork is withdrawn. This solution forms nearly a colourless varnish.

It may also be dissolved in the vapour of alcohol. If a piece of copal be suspended at the top of a close vessel, in which alcohol is made to boil, the copal will drop into it like oil.

Elastic, or *Caoutchouc*. (GER. *Federharz*. DA. *Veérkragtig hars*. DU. *Fiergummi*, *Elastisk gummi*. SW. *Elastisk Kåda*. FR. *Caoutchou*, *Résine élastique*. IT. *Gomma o Resina elastica*. SP. *Resina elastica*, *Ule*, *Ulce*. PORT. *Boracha*, *Resina do Para*, *Resina elastica das borachinhas*. LAT. *Gummi elasticum*.) This substance, usually termed *Indian rubber*, is prepared from the juice of a tree growing in Cayenne, and other parts of South America; called by the Mexicans *olin*, or *olli*, and the Spaniards *ulé*. It is the *iatropa elastica* of Linnæus. The *hevea* is the proper genus, though it may be obtained from the *urceola* described in vol. 5. of the Asiatic Researches; also from *artocarpus*; the Indian, and probably our own, fig-tree.

The trunk of the tree is wounded by a sharp instrument, and the juice which flows from it applied in successive coatings on a mould of clay, and dried by the fire or the sun; when it is of a sufficient thickness, the mould is removed: it is thus generally formed into the shape of bottles.

Besides its use for removing the marks of black-lead from paper, &c. it is employed in the construction of various surgical instruments. For this purpose it is re-dissolved, and applied over proper moulds.

Caoutchouc is soluble in the volatile oils, but remains somewhat glutinous after evaporation. A mixture of volatile oil and alcohol will also dissolve it; and it thus forms a good varnish. It is soluble in highly-rectified ether; and in rectified petroleum, and when the solution is evaporated, the caoutchouc remains unaltered. The latter is the means employed for the formation of instruments.

Elemi is also improperly termed a gum; it being a pure resin. It is brought to us from the Spanish West Indies, in long, roundish cakes. It is somewhat transparent, of a whitish-yellow colour inclining to green, of a strong, not unpleasant smell, said to exude from a tree of the olive kind, upon being wounded. Distilled with water, in the common manner, it yields a large portion of pale-coloured, thin, fragrant essential oil, there remaining behind in the still a resinous substance, friable when cold. This balsam is rarely made use of but in external applications, although from its fragrant, and the quantity of oil which it contains, it appears preferable to others at present much esteemed.

Euphorbium, (GER. *Euphorbiengummi*. DU. DA. and LAT. *Euphorbium*. SW. *Prustkåda*. FR. *Euphorbe*. IT. and SP. *Euforbio*. PORT. *Euforbio*, *Alforbo*.) a gum resin, brought to us from Africa, in loose, smooth, and glossy gold-coloured drops or granules.

It is only employed in medicine, as an external application.

Galbanum, a gum issuing from the stem of an umbelliferous plant, growing in Persia and many parts of Africa. It is sometimes met with in the shops in loose granules, called drops and tears, and sometimes in large masses, formed of a number of these blended together; but in these masses some accidental foulness is often mixed with the gum. The single drops usually approach to a roundish, oblong, pear-like form. *Galbanum* is soft like wax, and, when fresh drawn, white; but it afterwards becomes yellowish or reddish: it is of a strong smell, and of an acid, bitterish taste. In its medicinal qualities, it somewhat resembles *assa-fetida*, and *ammoniacum*; but it is more heating, and irritating. It may, however, be a useful substitute for the former, where the nauseous smell of that drug is objected to.

Gamboge. (GER. DA. and RUS. *Gummigutt*. DU. *Gutte gom*, *Gutta gamba*, *Gitte gom*. SW. *Gummigutta*. FR. *Gomme gutte*. IT. *Gomma gutta*. SP. *Gomma guta*, *Guta gamba*. PORT. *Gomma rom*, *Gomma guta*, *Gutta gamba*. POL. *Gummi-gotta*. LAT. *Gummi guttæ*, *Gutta gamba*, *Cambogia*.) This gum-resin is brought to us in the form of orbicular masses, or of cylindrical rolls of various sizes, and is of a dense, compact, and firm texture, and of a beautiful yellow. It is chiefly brought from Cambaja, in the East Indies, called also *Cambodja* and *Cambogia*; and thence it has obtained its names of *cambadium*, *cambogium*, and *gambogium*. The best sort is of a deep yellow or orange colour, breaks shining, and is free from dross; it has no smell, and very little taste, unless kept in the mouth for some time, when it impresses a slight sense of acrimony. It is used in medicine as a strong purgative, but its principal use is as a pigment in water colours, though it does not stand.

Guaiacum. See GUAIACUM.

Hederæ. (GER. *Epheuharz*. DU. *Veilhars*. DA. *Vedbendeharpir*. SW. *Murggrönkåda*. FR. *Résine hédérée ou de lierre*. IT. *Gomma d'edera*. SP. *Goma yedra*. PORT. *Goma d'era*. LAT. *Gummi hederæ*.) Lemery says that this gum exudes from incisions made in the *hedera arborea*, or tree-ivy, whence it is collected by the peasants in Italy, Provence, and Languedoc; an account which is confirmed by Pomet. When genuine, this gum is of a bright transparent reddish-brown colour, deeper than hyacinth, and approaching to the garnet: when reduced to powder, it is of a saffron yellow, and its taste and smell are agreeably aromatic. This gum is of a caustic nature, and is, therefore, frequently employed as a depilatory.

Juniper. This, which is almost a pure resin, is obtained from the juniper tree in

warm climates, particularly in Africa; it is semi-pellucid, and of a pale yellowish colour, and in small masses, resembling mastich, but larger. From its use, it has been called *vernix*, and the powder of it is employed to prevent ink running on paper, under the name of *pounce*. It has a light agreeable smell, and not much taste. It dissolves in rectified spirits, if violently shaken in them; and in oils, both expressed and distilled; but is insoluble in water.

Kino. This, formerly considered as a gum, is now known to be an extract. It was first brought from Gambia, but what is now imported chiefly comes from *Jamaica*, and is an extract of the sea-side grape, *coccoloba uvifera*: the finest, however, is drawn from different species of *eucalyptus*, particularly the *resinifera*, or brown gum-tree of Botany Bay. It is very friable, easily breaking between the fingers; without smell, of an opaque, dark, reddish colour, appearing almost black in the mass, and when powdered, of a deep lateritious red. On being chewed, it first crumbles, then coheres slightly, and seems soon to dissolve, with a very astringent, slightly-sweetish taste. It may be distinguished from the red lumps of the common gum Senegal, in being much more brittle; and from dragon's blood, by its dissolving in water; and from both, by its stypticity when tasted. It is a very useful astringent medicine; and is a good styptic when applied externally, combined with alum. It may also be employed as a useful article in dyeing. Wool and cotton boiled in a solution of kino, and then dipped in a bath of sulphat of iron, appeared of a bottle-green, which was changed by washing and drying to a blackish-brown, that proved very durable.

Lac, or *Gum-Lac*, (GER. *Lack*, *Gummilack*. DU. *Lak*, *Gomlak*. DA. *Lack*, *Gummilak*. SW. *Lack*, *Gummilak*. FR. *Lacque*, *Gomme lacque*. IT. *Lacca Gommalacca*. SP. *Goma laca*. PORT. *Laca*. RUS. *Laka*, *Gummilak*. POL. *Laka*, *Gumalaka*. LAT. *Gummi lacceæ*.) is the product of the *coccus lacca*, an insect, which deposits its eggs on the branches of a tree called *Bihar*, in Assam, a country bordering on Thibet, and elsewhere in India. It appears designed for defending the eggs from injury, and affording food for the maggot in a more advanced state. It is formed into cells finished with as much art and regularity as a honeycomb, but differently arranged; these the inhabitants collect twice a year, in the months of February and August. To purify it, it is broken into small pieces, and put into a canvas bag of about four feet long, and not above six inches in circumference. Two of these bags are in constant use, and each of them held by two men. The bag is placed over the fire, and frequently turned, till the lac is liquid enough to pass through its

pores; when it is taken off the fire, and twisted in different directions by the men who hold it, at the same time dragging it along the convex part of a plantain-tree, prepared for this purpose; and while this is doing, the other bag is heating to be treated in the same way. The mucilaginous and smooth surface of the plantain-tree prevents its adhering; and the degree of pressure regulates the thickness of the coating of lac, at the same time that the fineness of the bag determines its clearness and transparency.

Lac possesses the properties of a resin, and is the basis of many varnishes, and of the finest kinds of sealing-wax. It is used in painting, and imparts a fine red colour to silk and cotton, when these have been previously immersed in a weak decoction of the bark, known amongst dyers by the name of *lead*.

In India lac is fashioned into rings, beads, and other trinkets: wool tinged with it is employed as a fucus by the ladies; and the resinous part, melted and mixed with about thrice its weight of finely-powdered sand, forms polishing stones. The lapidaries mix powder of corundum with it in a similar manner.

Lac, white, or Laccic Acid. About the year 1786, Dr. Anderson of Madras was made acquainted with a substance formed as a kind of nidus or nest by the female of an insect of the genus *coccus*, of which the natives of India are very fond. This substance, which has a considerable resemblance to bees' wax, he named white lac. It is of a grey colour, opaque, rough, and in roundish pieces, weighing from three to fifteen grains; and on pressing it between the fingers, particularly when fresh gathered, a reddish fluid is squeezed out. When purified by fusion and straining through cloth, it adheres so firmly to wood, paper, tin, and other substances, as to answer the purpose of a strong cement. It does not afford a good varnish.

Ladanum. This is a gum-resin which exudes from a shrub, the *cistus ladaniferus*, which grows plentifully in Arabia, Candia, and other parts of the Archipelago. The best sort is in dark-coloured masses, of the consistence of hard wax, which grows softer when handled. An inferior sort is in long rolls, curled up, harder than the former, and of a paler colour. It has an agreeable smell, and a light pungent, bitter taste. It is used in medicine as a warm, stimulant external application, in the form of a plaster.

Mastich, or Mastic, (GER. DA. and Sw. Mastix. DU. Mastik. FR. Mastic. IT. Mastice. SP. Almastica, Almaciga. PORT. Almacega. RUS. Mastika. POL. Mastyks. LAT. Resina lentisina,) a gum-resin in the form of tears, of a very pale yellow colour, and farinaceous appearance, having little smell, and a bitter astringent taste. It flows naturally from the tree, but its produce is

accelerated by incisions. The lesser turpentine-tree, and the lentiscus, afford the mastic of commerce. See LENTISK.

It is used in fumigations, in the composition of varnishes, and is supposed to strengthen the gums. The tree which produces the mastic grows in several parts of Turkey, and in the isle of Chio, and is brought to us in tears or small lumps from Smyrna and Aleppo.

There is a sort of black mastich brought from Egypt, which serves to sophisticate camphor

Myrrh, (GER. Myrrhen. DU. Mirrha. DA. Myrre. SW. Myrha. FR. Myrrhe. IT. and SP. Mirra. PORT. and LAT. Myrrha,) a gum-resin, brought from the East Indies, and likewise from Alexandria, Smyrna, and Aleppo. It is hard, dry, glossy, of various colours, yellowish, reddish, brown, yellowish-brown, reddish-brown, blackish, intermixed with whitish specks or tears, transparent like agate, or opaque like pitch, of a peculiar strong smell, and a bitter somewhat biting taste. The best is that which is of a reddish-brown colour, not verging too much to yellowish or blackish; uniform on the outside, internally specked or streaked with white, clear and bright, somewhat unctuous to the touch, but not tenacious, so as to stick to the fingers.

This gummy-resin is liable to great abuses; the larger masses in particular are frequently no other than some artificial composition, skilfully incrustated on the outside with a solution of myrrh. Some report that bdellium is nearly allied to myrrh, and not easily to be distinguished from it; the differences, however, are sufficiently obvious, bdellium being darker coloured and less transparent than good myrrh, internally soft and tenacious, (which myrrh never is,) yielding a quite different smell, and wanting its bitterness.

Of the tree which produces myrrh we have no certain account; according to Bruce, it belongs to the genus *mimosa*, and grows in Abyssinia and Arabia.

To have the first and most perfect kind of myrrh, a young vigorous tree is selected, free from moss or any other plant adhering to the bark, and a deep incision is made with a hatchet, above the first large branches. What runs from this wound the first year is myrrh of the first growth, and never plentiful. This operation is performed, some time after the rains have ceased. At each return of the season, the sap continues to run, in the course to which it has been accustomed; but by the second year, the tree begins to rot at the place of incision, so that the myrrh is of a secondary quality. That obtained from incisions near the roots and in the trunks of old trees, is also of an inferior quality.

Grand Cairo is the great staple for the myrrh-trade; but by far more considerable

quantities are brought from Arabia Felix, than from Ethiopia and Abyssinia; and the quality of the latter, distinguished also by the name of Troglodite myrrh, was always more valued. The virtues of this aromatic bitter are to warm and strengthen the bowels. It frequently occasions a mild diaphoresis, and promotes the fluid secretions in general. Hence it proves serviceable in languid cases, diseases arising from a simple inactivity, cachectic disorders, and where the lungs and thorax are oppressed by viscid phlegm. Myrrh is likewise the basis of an official tincture, which, used in a small quantity with water, operates upon the gums as an astringent and antiscorbutic.

On inclosing some powdered myrrh in the white of a hard boiled egg, and setting it in a moist cellar, the liquor into which the egg is by degrees resolved, extracts nearly all the smell and taste of the myrrh. This liquor, commonly *Oleum myrrhæ per deliquium*, is precipitated or coagulated by alcohol; and the unctuous coagulum, separated from the spirit, dissolves again in pure water. This process has been applied likewise to mastich and other pure resins; but from these the white of egg extracts nothing. This oil of myrrh has been highly praised as a cosmetic.

New-Holland. A red, and a yellowish-coloured, concrete gum-resin, have been brought from New-Holland; the first is powerfully astringent, and not unlike kino; the yellow is not very dissimilar in its general properties; but the plant from which the red is procured is the *eucalyptus resinifera* of Willdenow; the other is from a low herbaceous shrub, not described. They have been occasionally employed in medicine, and appear to possess the same qualities as gum-kino.

Olibanum, a dry resinous substance obtained from the *juniperus lycia*, and chiefly collected in Arabia. It is the frankincense of the ancients. It is in transparent brittle masses about the size of a chesnut. Its colour yellow. It has little taste, and when burnt diffuses an agreeable odour. Alcohol dissolves it; and with water it forms a milky liquid. When distilled, it yields a small quantity of volatile oil. Olibanum is to be chosen whitish-yellow, pure, dry, and as much approaching to clearness as possible.

Opoponax, (GER. Du. Da. and Sw. *Opopanax*. FR. *Opopanax*. IT. *Opoponasso*. SP. and PORT. *Opoponaca*. LAT. *Opopanax*.) a gum-resin obtained from the *pastinaco opoponax*, a plant which is a native of the countries round the Levant. The milky juice, when dried in the sun, constitutes the opoponax. It is in lumps of a reddish-yellow colour, and white within, of a bitter and acrid taste.

Opoponax is usually brought to us in granules or drops, and sometimes in large masses, formed by a number of the drops

connected by a quantity of substance of the same kind; but these are usually loaded with extraneous matter; and are greatly inferior to the loose kind.

The drops, or granules, of the fine opoponax are on the outside of a brownish-red colour, and of a dusky yellowish or whitish colour within: they are of a somewhat unctuous appearance, smooth on the surface, and are to be chosen in clear pieces, and of a strong smell and acrid taste. This article is not only imported from the Levant, but from the East Indies, where the tree which produces it grows spontaneously.

Its virtues are those of an attenuating medicine. It dispels flatulencies, and is good in asthma, in inveterate coughs, and some disorders of the head and nerves.

Sagapenum, (GER. *Sagapengummi*. DU. DA. and SW. *Sagapen*. FR. *Gomme sagapin*, or *seraphique*. IT. SP. and PORT. *Sagapeno*. LAT. *Sagapenum*.) is the gummy, resinous juice of an oriental, or rather African plant, supposed to be a species of *ferula*. It is brought from Alexandria, either in distinct tears, or in large masses: externally it is yellow, internally paler, and semi-transparent; sometimes it is of a greenish hue, soft, and sticking to the fingers when handled: this is inferior in quality to the former. Pieces of bdellium, sometimes sold for it, may be distinguished by their weaker smell: that of sagapenum somewhat resembles garlic, or a mixture of assa-fetida and galbanum. The taste is moderately hot and pungent. Its medicinal properties are similar to those of assa-fetida and galbanum combined.

Sandarach, (GER. *Sandarak*. DU. and DA. *Sandrak*. SW. *Eukäda*. FR. *Gomme sandarac*. IT. SP. and PORT. *Sandaraca*. LAT. *Sandaracha*.) a gum-resin in yellowish-white tears, possessing a considerable degree of transparency. According to Mr. Schousboe, a Danish traveller, the tree which produces it is a species of *thina*, that does not exceed twenty or thirty feet in height, and ten or twelve inches in the diameter of the trunk. This tree grows in Africa, whence this gum-resin is brought to us. Its powder is well known by the name of pounce, to be applied to paper when the size has been scraped off by erasion. Considerable quantities of sandarach are consumed by varnish-makers, who dissolve it in oil of turpentine or linseed, or in spirits of wine, and thus prepare a kind of varnish known under the name of vernix, which is used by cabinet-makers and painters.

Sarcocolla, (GER. *Fleischleim*. DU. *Vleeschlym*. DA. *Küdlüm*. SW. *Kütlüm*. FR. *Sarcocolle*. IT. *Sarcocolla*. SP. and PORT. *Sarcocola*. LAT. *Sarcocolla*.) is a gum-resin from the *penoea mucronata*, or *sarcocolla*, of Linnæus, and is brought from Persia and Arabia, in small spongy grains of a whitish-yellow, and sometimes of a red co-

lour, about the size of a pea; the whitest and most bitter are preferred. It softens in the mouth, and the bitter taste is followed by a slight sweetness. Its principal use is as an application to fresh wounds, when dissolved in proof spirit of wine.

Scammony, (GER. *Skammonien*. DU. *Skammonium*. DA. *Skammonium*. SW. *Skammonium*. FR. *Scammonée*. IT. *Scammonia*. SP. and PORT. *Escamonea*. LAT. *Scammonium*.) is the produce of a species of convolvulus, or creeper plant; which grows wild in the vales between Nazareth and Mount Carmel. The scammony is prepared from the root and the stalk of the plant, and when genuine ought to be like a fine clear gum, of a darkish grey, brittle, and in chewing, ought to yield a white milky froth. The best scammony is brought from Marasch, a town about four days' journey from Aleppo, near the confines of Armenia. It is thence carried to Aleppo, in small skins, and by the merchants sent to London and Marseilles. An inferior sort is brought from Smyrna, which is heavier, and more pungent to the taste than that from Aleppo; it is also mixed with much extraneous matter. It is of considerable use in medicine, as an active purgative.

Senegal, or *Senega*, (GER. *Senegalgummi*. FR. *Gomme du Senegal*. IT. *Gomma del Senegal*. SP. and PORT. *Goma Senegal*. LAT. *Senegal*.) does not differ greatly from gum-arabic: the pieces are larger, and it seems to communicate a higher degree of adhesive quality to water. It is brought to us principally from Africa and the Levant; and is applied to the same uses as gum-arabic.

Tragacanth, or *Dragant*, (GER. *Gummi Dragant*. DU. DA. SW. RUS. and POL. *Dragant*. FR. *Gomme adragant*. IT. *Gomma adragante*. SP. and PORT. *Alguivira*.) is obtained from a small plant of the same name growing in Syria and other eastern parts. It is chiefly brought to us from Turkey, in small white contorted pieces resembling worms. It is usually dearer than other gums, and forms a thicker jelly with water. This article is of great use in medicine as a demulcent. Skinners and curriers likewise use considerable quantities of it in the preparation of their leather, and prefer a brown or blackish sort; though for all other purposes the white gum is best.

GUN, (*Guns*. GER. *Gewehre*, *Schiessgewehre*. DU. *Geweeren*, *Schietgeweeren*. DA. *Gevær*. SW. *Gevär*. FR. *Armes à feu*. IT. *Arme da fuoco*. SP. *Armas de fuego*. RUS. *Rushe*, *Orushie*. POL. *Brón*, *Oreze*. PORT. *Armas de fogo*.) a fire-arm, or weapon of offence, which forcibly discharges a ball or other matter through a cylindrical tube, by means of inflamed gunpowder. The word gun now includes most of the species of fire-arms (mortars and pistols excepted), which are divided into great, and small, guns; the former including all that are usually called

cannon, ordnance, or artillery, and the latter including muskets, firelocks, carabines, musketoons, blunderbusses, fowling-pieces, &c. Artillery are principally cast at Woolwich, and small arms are manufactured at Sheffield and Birmingham. See **CANNON**, **MUSKET**, and **FIRE-ARMS**.

GUNPOWDER, (GER. *Pulver*, *Schiesspulver*. DU. *Buskruid*. DA. *Kruidt*, *Pulver*. SW. *Krut*. FR. *Poudre*. IT. *Polvere*. SP. and PORT. *Polvora*. RUS. *Poroch*. POL. *Proch*. LAT. *Pulvis pyrius*.) a composition of nitre, sulphur, and charcoal, mixed together, and usually granulated.

To make gunpowder, properly, regard is to be had to the purity or goodness of the ingredients, as well as the proportions of them; for the strength of the powder depends much on that circumstance, and also on the due working or mixing of them together.

To purify the nitre, by taking away the first or common salt, and earthy part. Dissolve it in a quantity of hot water over the fire; then filter it through a flannel bag, into an open vessel, and set it aside to cool, and crystallize. These may in like manner be dissolved, and crystallized again; and so on, till they become quite pure and white. Then put them into a dry kettle over a moderate fire, which gradually increase till they begin to smoke, evaporate, lose their humidity, and grow very white: the mass must be kept continually stirring with a ladle, lest it should return to its former figure, by which its greasiness would be taken away; after that, so much water is to be poured into the kettle as will cover the nitre; and when it is dissolved, and reduced to the consistency of a thick liquor, it must be continually stirred with a ladle, till all the moisture is again evaporated, and it is reduced to a dry and white meal.

The like regard is to be had to the sulphur; choosing that which is in large lumps, clear, and perfectly yellow; not very hard, nor compact, but porous; nor yet too much shining; and if, when set on fire, it freely burns all away, it is a sign of its goodness; so likewise, if it is pressed between the two iron plates that are hot enough to make it run, and in the running appears yellow, and that which remains a reddish colour, it is then fit for the purpose: but in case it is foul, it may be purified in the following manner; melt the sulphur in a large iron ladle or pot, over a very gentle coal-fire, well kindled, but not flaming; then scum off all that rises on the top, and swims upon the sulphur, take it presently after from the fire, and strain it through a double linen cloth, letting it pass leisurely; by which means it is purified, the gross matter remaining behind in the cloth.

For the charcoal, the third ingredient, such should be chosen as is large, clear, and free from knots, well burnt, and cleaving.

The charcoal of light woods is mostly preferred, as of willow, and that of the branches of a moderate thickness, as of an inch or two in diameter. Dogwood is now much esteemed for this purpose; and a method of charring the wood in a large iron cylinder has lately been recommended, and proved as yielding a better ingredient than formerly. The charcoal not only concurs with the sulphur in supplying the inflammable matter, which causes the detonation of the nitre, but also greatly adds to its explosive power by the quantity of carbonic acid gas expelled during its combustion. These three ingredients, in their purest state, being procured, long experience has shown that to have the best effect they are to be mixed together in the proportion of seventy-five parts by weight of nitre, sixteen of charcoal, and nine of sulphur.

It is not the due proportion of the materials only, which is necessary to the making of good gunpowder; another circumstance, not less essential, being the mixing them well together: if this be not effectually done, some parts of the composition will have too much nitre in them, and others too little, and in either case there will be a defect of strength in the powder.

After the materials have been reduced to fine dust, they are mixed together, and moistened with water, vinegar, or wine, or spirit of wine, &c. and then beaten with wooden pestles for 24 hours, either by hand, or mills, and afterwards pressed into a hard, firm, and solid cake. When dry it is grained or corned, which is done by breaking the cake into small pieces, and so running it through a sieve, by which means the grains may have any size given them, according to the nature of the sieve employed; and thus also the dust is separated from the grains, mixed with other unmanufactured powder, and again worked up into cakes.

Glazing or smoothing of gunpowder, is performed as follows: a hollow cylinder or cask is mounted on an axis, turned by a wheel; this cask is half filled with powder, and turned for six hours; and thus from mutual friction of the grains it is smoothed, or glazed. The fine mealy part, thus separated or worn off from the rest, is again granulated.

To recover damaged gunpowder: put part of the powder on a sail-cloth, to which add an equal weight of what is really good, then with a shovel mingle it well together, dry it in the sun, and barrel it up, keeping it in a dry and proper place. If it is very bad, restore it by moistening it with vinegar, water, urine, or brandy; then beat it fine, sift it, and to every pound of powder, add an ounce of two ounces (according as it is decayed) of melted nitre; and afterwards these ingredients are to be moistened and well mixed, so that no particular substance may be dis-

cerned, which may be known by cutting the mass, and then granulate it as usual.

Laws concerning gunpowder.—No person shall make gunpowder but in the regular manufactories established at the time of making the stat. 12 Geo. 3. c. 61. or licensed by the sessions, pursuant to certain provisions, under forfeiture of the gunpowder, and 2s. per lb. nor are pestle-mills to be used under a similar penalty.

Only 40lbs. of powder to be made at one time under one pair of stones, except powder made at Battle, and elsewhere in Sussex.

No more than 40 cwt. to be dried at one time in one stone; and the quantity only required for immediate use to be kept in or near the place of making, except in brick or stone magazines, 50 yards at least from the mill.

Not more than 25 barrels to be carried by any land-carriage, nor more than 200 barrels by water, unless going by sea or coastwise, each barrel not to contain more than 100lbs.

No dealer to keep more than 200lbs. of powder, nor any person not a dealer, more than 50lbs. in the cities of London or Westminster, or within three miles thereof, or within any other city, borough, or market-town, or one mile thereof, or within two miles of the king's palaces or magazines, or half a mile of any parish-church, on pain of forfeiture, and 2s. per lb.; except in licensed mills, or to the amount of 300lbs. for the use of collieries, within 200 yards of them.

By 51 Geo. 3. c. 73. all masters of vessels, before entering the river Medway, shall deposit all gunpowder on board above 5lbs., in such warehouses as shall be appointed by the lords commissioners of the Admiralty, under a penalty not exceeding 20l. nor less than 5l. with all the gunpowder on board.

The 54 Geo. 3. c. 159. further regulates the places of deposit for gunpowder; inflicts penalties on persons having the command of private ships, who shall keep the guns thereof shot or loaded within the ports and harbours of the United Kingdom; and authorises all officers belonging to his majesty's ships, docks, arsenals, &c. to search for and seize gunpowder, &c. with a penalty of 10l. for obstructing the same, &c.

GUN-SMITH. The business of a gunsmith consists in the making fire-arms of the smaller sort, as muskets, fowling-pieces, pistols, &c. The principal part of these instruments is the barrel, which ought to have the following properties, viz. lightness, that it may incommode the person who carries it as little as possible, and sufficient strength, and other properties requisite to prevent its bursting by a discharge. It ought to be constructed in such a manner as not to recoil with violence, and to be of sufficient length to carry the shot to as great a distance as the force of the powder

employed is capable of doing. The stock or wooden frame of the gun ought to be formed of durable, and, if possible, incorruptible wood. The wood of walnut tree, especially the large roots, is most commonly used for this purpose.

GUN-WALE, or **GUNNEL**, is the uppermost wale of a ship, or that piece of timber which reaches on either side from the quarter-deck to the fore-castle, being the uppermost bend which finishes the upper works of the hull, in that part in which are put the stanchions which support the waste-trees.

GUPPAS, weights used in some towns in the streights of Malacca, particularly at Gueda. Four guppas make one quantas; sixteen quantas one hale, or nali; and fifteen halis the bahar of 450lbs. weight.

GUY, in a ship, is any rope used for keeping off things from bearing or falling against the ship's sides, when they are hoisting in. That rope which at one end is made fast to the foremast, and seized to a single block at the pendant of the garnet, is called the guy or the garnet.

GUZ. See **COUIT**.

GYP SUM, or **PLASTER-STONE**; native sulphate of lime. Various species of this stone are discovered in Saxony, Spain, Italy, and other parts of Europe, and substances of a gypseous nature also abound in several parts of this country.

That found in Derbyshire and Nottinghamshire is so fine as to admit of being po-

lished and manufactured into vases, in a manner similar to alabaster: the chief use of gypsum, however, is as a material for small ornaments and figures; as well as moulds for casting wax-work, &c.; but it has within these few years been most advantageously employed as manure, and is every day more and more used in that manner; and is become on that account an article of considerable domestic commerce. It is also much used in the midland and northern counties for laying what are called "plaister-floors," an excellent preventive against conflagration. For this purpose the gypsum is first calcined in kilns constructed for the purpose, then threshed on a floor with flails till reduced to a powder, then mixed to a proper consistency with soft water, and spread upon reeds, or laths, with trowels adapted specially to the purpose. A floor thus made becomes, after a few days, one solid mass like stone. By the admixture of ochre, rose pink, and other coloured earths, various tinges may be given to floors of this material.

Before we conclude this article, it may be well to mention an opinion which prevails in America, where it is much used as a manure; viz. that it is a mere *caput mortuum*; producing no good effect whatever, applied to land within reach of the sea-breeze. The fact of such an opinion being held is beyond controversy, but an elementary work is not the place for discussing the reasonableness of it.

H A B

H, The eighth letter of our alphabet, used as a numeral, denotes 200; and with a dash over it, **H**, 200,000.

HABEAS CORPUS. Wherever a person is restrained of his liberty by being confined in a common gaol, or by a private person, whether it be for a criminal or civil cause, he may regularly, by *habeas corpus*, have his body and cause removed to some superior jurisdiction, which hath authority to examine the legality of such commitment, and on the return thereof, either bail, discharge, or remand the prisoner. *Vaughan*, 136. Bushel's case. A writ of *habeas corpus* at common law, moved for in term time, is not grantable of course; but if the court see that there is no pretence for discharging the prisoner, they may refuse the writ to bring him up. *Hobhouse's case*, 3 *Barnewall & Alderson*, 421. It seems not yet decided, whether a single judge, applied to under the 31 Car. 2. c. 2. § 10., in vacation, has a discretion to refuse the writ. *Same case*.

HABERDASHER, a seller of hats, or of small wares, as pins, needles, thread, tapes, ribbons, &c. The master and wardens of the

H Æ M

company of haberdashers in London, mayors, &c. of towns, calling to their assistance one of the company of cappers, and another of the hat-makers, may search the wares of all hatters that work hats with foreign wool, and have not been apprentices to the trade, or who dye them with any thing but copperas and galls, or woad and madder; in which case they are liable to penalties, by stat. 8 Eliz. c. 7. and 5 Geo. 2. c. 22.

HABERDASHERY, consists of all kinds of ware sold by haberdashers.

HABERDINE, a dried salt cod.

HABERGEON, a small coat of mail, or only sleeves and gorget of mail, formed of little iron rings or meshes linked into each other.

HADDOCK, a fish of the cod species, a native of the northern seas, where, like the cod, it is met with in prodigious shoals. Vast quantities are taken about Helligoland, and on the northern coasts of Great Britain. The season commences about the 10th or 12th of December, and continues till the latter end of January, or the beginning of February.

HÆMATITES, or **BLOOD-STONE**. See **BLOOD-STONE**.

HAIR. (*Human Hair.* GER. *Haare*, *Menschen-haar*. DU. *Hair*. DA. *Haar*. SW. *Här*. FR. *Cheveux*. IT. *Capelli umani*. SP. and PORT. *Cabellos*. RUS. *Wolossi*. POL. *Włosy*. LAT. *Capilli*.)

Hair of Beasts. (GER. *Haare*, *Huhaar*. DU. *Hair*. DA. *Haar*. SW. *Här*. FR. *Poils*. IT. and SP. *Pelo*. PORT. *Pello*. RUS. *Scherot*. LAT. *Pelles*.) a sort of tegument for the greatest part of animals. It is a considerable article in commerce. The hair-merchants import human hair, goats' hair, horse-hair, &c. and also purchase hair of those who travel over all parts of the kingdom to procure it; after they have prepared it, they sell it either curled or uncurled to the manufacturers. That of the growth of the northern countries is much preferred to that of the more southern ones. Hair should be well fed, neither too coarse nor too fine; the coarseness rendering it less susceptible of an artificial curl, and disposing it rather to frizzle; and the fineness making its curl of too short a duration. Vast quantities of the hair of goats, &c. is consumed in the manufacture of hats and various other articles.

HAIR'S BREADTH, a measure of length, being the 48th part of an inch.

HAIR-POWDER, (GER. *Puder*. DU. *Poeder*, *Poyer*. DA. *Pudder*. SW. *Puder*. FR. *Poudre à poudrer*. IT. *Polvere di cipri*. SP. *Polvos de peluca*. RUS. *Polvos de Chipre*. PORT. *Polvinkas*. POS. *de trigo*. POS. *de goma de mandioca*. RUS. *Pudra*. POL. *Pudre*.) a well-known powder used as an ornament for the hair, and generally made from starch pulverized, and sometimes perfumed. An annual tax of 1*l.* 5*s.* 6*d.* is laid upon all persons who wear hair-powder. Prussia and Germany are both noted for their extensive hair-powder manufactories.

By 10 Ann. c. 26. s. 31. 12 Ann. stat. 2. c. 9. s. 2. and 4 Geo. 2. c. 14. s. 8. persons mixing hair-powder with starch or alabaster, &c. are subjected to a severe penalty.

No hair-powder makers to have alabaster in their custody. 4 Geo. 2. c. 14. s. 6.

HALE. See **HALL**.

HALFPENNY, an English copper coin, the value of which is denoted by its name.

HALL. See **GUPPAS**.

HALLAGE, a fee due for cloths brought for sale to Blackwell-hall, London. Also a toll due to the lord of a fair or market, for such goods as are sold in the common hall of the place.

HAMMER, (GER. *Hammar*. DU. *Hammer*. DA. *Hammer*. SW. *Hamrar*. FR. *Marteau*. IT. *Martello*. SP. *Martillo*. RUS. *Molotok*. POL. *Młot*. LAT. *Malleus*.) a tool used by mechanics, consisting of an iron head fixed crosswise upon a handle of wood. There are several sorts of hammers used by blacksmiths, viz. the hand-hammer, which is of such weight that it may be wielded or governed with one hand at the anvil. The up-hand sledge, used with both hands, and

seldom lifted above the head. The about-sledge, which is the largest hammer of all, and held by both hands at the farthest end of the handle, and being swung at arm's length over the head, is made to fall upon the work with as heavy a blow as possible. There is also another hammer used by smiths, called a rivetting-hammer, which is the smallest of all, and seldom used in the forge, unless upon small work.

HAMS, (GER. *Schinken*. DU. *Hammen*. DA. *Skinker*. SW. *Skinkor*. FR. *Jambons*. IT. *Prosciutti*. SP. *Jamones*. PORT. *Presuntas*. RUS. *Okorokii*. POL. *Szynki*.) the thighs of the hog salted and dried. Yorkshire, Hampshire, Wiltshire, and Cumberland, are the counties of England most famous for producing fine hams. The hams of Portugal and Westphalia are exquisitely flavoured; they are frequently imported into Great Britain. We export hams to the West Indies. The Westphalia hams, and those which are made to imitate them, are dried by hanging in the smoke of a wood-fire, for at least a month.

HAND'S BREADTH, a measure of three inches.

HANDFUL, or simply **HAND**, a measure of four inches by the standard, according to stat. 35 Hen. 8. The hand among horse-dealers, &c. is four-fingers' breadth, being the fist clenched, whereby the height of a horse is measured.

HANSE TOWNS, a number of maritime towns, which originally associated together in a league, for the protection of their commerce. See title **EUROPE**.

HARBOUR, a portion of the sea adjacent to land, where ships safely ride at anchor, free from the dangers of the winds and waves.

HARBOURS and **HAVENS**. The harbours, and mouths of rivers in this kingdom, are protected by numerous statutes, both general and local. Of the former description are 19 Geo. 2. c. 22. 9 Geo. 3. c. 30. and lastly 54 Geo. 3. c. 159. By these, especially the last mentioned, the moorings of his majesty's ships are provided for in preference to those of any private or merchant vessel, the breaching of private vessels is regulated, the sweeping for stores is prohibited with certain exceptions, unloading ballast improperly is subjected to heavy penalties, the taking shingle from the shores without licence is forbidden, and sunken vessels are ordered to be raised, with many other provisions respecting the landing of gun-powder, the un-shooting of guns, &c. &c.

HARDENING, the giving a greater degree of hardness to bodies than they had before. Steel and iron are hardened and tempered divers ways, as by the hammer, quenching the metal, when hot, in cold water, case-hardening, &c. To harden and temper English, Flemish, and Swedish steel, they beat it pretty high, then suddenly quench it in water, to make it very hard: Spanish and Venice steel need only a blood-

red heat, and then be quenched. Sometimes they rub ground indigo and sallad oil upon it with a woollen rag, while it is heating, and let it cool of itself. If the steel be too brittle for an edge, spring, &c. bring it down thus: Take a piece of grindstone or whetstone, and rub the work hard upon it, to take off the black scurf, and brighten it; thus let it heat in the fire, and it will gradually change colour, coming first to a light goldish colour, then to a darker goldish, and at last to a blue colour: choose which of these the work requires, and quench it suddenly in water.

Hammer-hardening is generally used in hardening iron and steel plates for saws, springs, rules, and such like articles.

Case-hardening is a lesser degree of steel-making, and is performed by baking razors, files, knife-blades, &c. in a kind of oven, and laying over them strata of powdered charcoal, hoofs, horns, &c. so as to exclude the air from them; and thus by baking to give a coat of steel to those instruments some depth below their surface. Some persons cover the iron or steel all over with a composition of an equal quantity of powdered horn, bay-salt, stale urine, or white-wine vinegar, well mixed together, and then wrap it up in loam or plate-iron, and bring the whole in the fire to a blood-red heat, and no higher, and lastly, take it out and quench it.

HARDS of flax or hemp, are the coarser parts separated in dressing from the tear or fine stuff.

HAIRDWARE, (GER. *Kurze waaren*. DU. *Yzerkramery*. DA. *Isenkramvarer*. SW. *Järnkram*. FR. *Clinguallerie*, *Quincaillerie*. IT. *Chincaglio*. SP. *Quinquilleria*. PORT. *Quincalharia*. RUS. *Myelotschnue towarii*.) includes in few words every kind of goods manufactured from metals, and thus comprises iron, brazen, steel, and copper articles of all descriptions. Birmingham and Sheffield are the principal seats of the British hardware-manufactures; and from these towns immense quantities of knives, razors, scissors, gilt and plated ware, fire-arms, &c. &c. are exported to most parts of the continent of Europe, and iron utensils of various kinds to our colonies in the West Indies, to Africa, and the continent of America.

HAIRDWARE-MAN. The tradesman thus named, is a dealer in all the last-mentioned manufactures.

HARES' WOOL, or the fur of the quadruped called the hare, is much used by hatters, who employ it in the formation of the bodies of hats. The colour of the wool of the British dominions is generally dark-brown; and, if good, silvery at the bottom, near the pelt; but from the northern parts of Europe, Asia, and America, we not unfrequently obtain black and white hares' wool.

HARNESS, (GER. *Pferdegesschirr*. DU.

Paardetuig. DA. *Hestetøj*. SW. *Hästtyg*, *Selttyg*. FR. *Harnois de Cheval*. IT. *Arnese*, *Bardatura o Fornimento d'un Cavallo*. SP. *Arneses*, *Jaeces*. PORT. *Arnes s. Jaex de hum Cavallo*. RUS. *Konskoi*, *uber*. POL. *Rzad*, *Szur*, *Konski*.) leather furniture for horses, usually mounted or embellished with studs of brass or copper gilt or plated.

HARP, (*Harps*. GER. *Harfen*. DU. *Harpen*. DA. *Harper*. SW. *Harper*. FR. *Harpes*. IT. *Arpe*. SP. *Harpas*. PORT. *Arpas*, *Harpas*. LAT. *Citharæ*.) a stringed instrument, consisting of a triangular frame, the chords of which are distended in parallel directions from the upper part to one of its sides. Its scale extends through the common compass, and the strings are tuned by semitonic intervals. It stands erect, and when used, is placed at the feet of the performer, who produces its tones by the action of the thumb and fingers of both hands on the strings. That the harp is among the most ancient of musical instruments, the frequent mention of it in scripture, and the splendid account transmitted to us of the Theban harp, both as to the beauty of its decorations and extent of scale, are sufficient evidences. The Irish and Welsh practised the harp long before the gamut of Guido was invented, and it is, indeed, their national instrument. In England also it was early introduced into general use; and the most ancient poems were sung to it on Sundays, and all public festivals. They differ, however, much in their construction from one another. In early times the single harp (or harp with only one row of strings) which was small and portable, and confined to the number of its strings, was obliged to be tuned every time the key changed. In time the double harp (or harp with two rows of strings) was invented; the flats and sharps were made on the new row of strings, while the other was tuned as usual in the diatonic scale. The next, and greatest, improvement was the triple harp, (a harp with three rows of strings,) which was invented about the 14th century. The present triple harp extends to the compass of five octaves, or more: the total number of strings is about a hundred. The performer is obliged to tune the harp every time he changes the key, which being troublesome gives a great advantage to the pedal harp: but in many passages the Welsh harp is much superior. The Welsh harper plays the treble with the left hand, and the bass with the right. It is the reverse with those who play the pedal harp.

An instrument named the harp-lute has lately been invented, which partakes of both these instruments. It is smaller in size than the pedal harp, and is placed somewhat like a guitar upon the knees, but more perpendicular. A considerable traffic in these latter mentioned instruments is carried on to both the East, and West, Indies, and to many parts of Europe. One Light is the inventor.

HARPING-IRON, or **HARPOON**, (*Harpoons*. GER. *Harpunen*. DU. *Harpoenen*. DA. *Harpune*. SW. *Harpun*. FR. *Harpons*. IT. *Ramponi*. SP. *Arpones*. PORT. *Harpoes*. RUS. *Ostrogi*.) a large spear or javelin, made of forged iron, and five or six feet long; it is fastened to a line, and is used in the whale fishery. See **FISHERY**.

HARPINGS, in a ship, properly denote her breadth at the bow. Some also give the same name to the ends of the bends that are fastened into the stern.

HARPOON-GUN, a sort of fire-arm for discharging harpoons at whales, and thereby striking them with greater certainty, killing them more expeditiously than when harpoons are thrown by the hand.

HARPSICHORD, (*Harpsichords*. GER. *Klaviere*. DU. *Clavieren*. DA. *Claveer*. SW. *Claver*. FR. *Clavécins*. IT. *Gravicembali*. SP. *Clavicordios*, *Claves*. PORT. *Cravos*. RUS. *Klawirü*.) a stringed instrument, consisting of a case containing the belly or sounding board, over which the wires are distended, supported by bridges. In the front the keys are disposed, the long ones of which are the naturals, and the short ones the sharps and flats. These keys being pressed by the fingers, their inclosed extremities raise little upright oblong slips of wood called jacks, furnished with crow-quill plectrums, which strike the wires. The great advantage of the harpsichord beyond most other stringed instruments, consists in its capacity of sounding many notes at once, and forming those combinations, and performing those evolutions of harmony, which a single instrument cannot command. This instrument is an improvement upon the clarichord, which was borrowed from the harp, and has, for more than a century, been in the highest esteem; but since the invention of the piano forte, its practice has considerably declined. Harpsichords and piano-fortes are manufactured in the highest perfection at London, where they are sold at various prices from 18 to 100 guineas each, according to the goodness of their tones, the beauty of their structure, &c.

HARQUEBUSS, a piece of fire-arms, of the length of a musket, usually cocked with a wheel. It carries a ball that weighs one ounce seven-eighths. This weapon is now nearly out of use.

HARROW, an agricultural implement, consisting of a frame of timbers crossing each other, and set with iron teeth. It is employed to break and scatter the ground previously turned up by the plough.

HARTSHORN, (GER. *Hirschhorn*. DU. *Hartshoorn*. DA. *Hjortetage*. SW. *Hjorthorn*. FR. *Corne de cerf*. IT. *Corni di cervo*. SP. *Cuerno de ciervo*. PORT. *Ponta de veado*. RUS. *Olenoi rog*. POL. *Rogiceni*. LAT. *Cornu cervi*.) is the entire horns of the male deer, as separated from the head, with-

out further preparation. The chemical analysis of hartshorn is sufficiently known; it yields a water highly impregnated with a volatile salt, which is called spirit of harts-horn, with a fœtid oil, and volatile salt by the common distillation in a retort on an open fire. The remainder in the bottom of the retort, after the distillation is finished, is black; but on calcining it in an open fire, it becomes white and friable, and is sold in the shops under the name of *burnt hartshorn*. Besides these preparations, we use the shavings of the horns, which on long boiling in water become a jelly. This jelly is nutritive and strengthening; it is sometimes given in diarrhoeas, but a decoction of the burnt hartshorn in water is more frequently used for this purpose, and is what is called *hartshorn drink*.

HASAER MENARIE, a silver coin, current in Persia, worth ten mamondis, or 6s. 8d. sterling.

HASP, a clasp folded over a staple and fastened on with a padlock. Hasps are usually made of iron, and are, for the most part, manufactured at and in the vicinities of Birmingham and Wolverhampton.

HAT, (*Hats*. GER. *Hüte*. DU. *Hoeden*. DA. *Hatte*. SW. *Hattar*. FR. *Chapeaux*. IT. *Cappelli*. SP. *Sombremos*. PORT. *Chapess*. RUS. *Schlopü*. POL. *Kapeluszy*.) a well-known covering for the head, with a brim, which distinguishes it from a cap, or a bonnet. Beaver hats are said to have been introduced in the reign of Queen Elizabeth, and common in that of Car. I. The importation of them was prohibited by proclamation, as well as the admixture of hair and wool, in the manufacture of them in this country.

The manufacture of hats is of late years become a great object of national commerce; and the improvements made therein are considerable.

The materials for making them are, rabbits' fur cut off from the skin, together with wool and beaver; to which have been lately introduced mole fur, and kid hair. These are mixed in various proportions, and of different qualities, according to the value of the hats intended to be made: but the beaver is now wholly used for facing the finer hats, and not for the body or main stuff. Experience has shown, that the hair or fur cannot be evenly and well felted together, unless all the fibres be first separated, or put into the same state with regard to each other. This is the object of the first process of hat-making, and is called *bowing*. The material is laid upon a platform of wood, or of wire, about four feet square, called a *hurdle*, which is fixed against the wall of the workshop and is enlightened by a small window, and separated by two side partitions from other hurdles, which occupy the rest of the space along the wall. The hurdle, if of wood, is made of deal boards, not quite three inches wide, disposed

parallel to the wall, and at the distance of one-fortieth of an inch from each other, for the purpose of suffering the dust, and other impurities of the stuff, to pass through; a purpose still more effectually answered by a hurdle of wire. The workman is provided with a bow, a bow-pin, a basket, and several cloths. The bow is a pole of yellow deal or ash, about seven feet long, to which are fixed two bridges, somewhat like that which receives the hair in the bow of the violin. Over these is stretched a cat-gut, about one-twelfth of an inch in thickness. The bow-pin is a stick with a knob, and is used for plucking the bow-string. The basket is a square piece of ozier-work, consisting of open straight bars with no crossing or interweaving; its length across the bars two feet, and its breadth eighteen inches. The sides into which the bars are fixed are slightly bent into a circular curve, so that the basket may be set upright on one of these edges near the right-hand end of the hurdle, where it usually stands. The cloths are linen. Besides these implements, the workman is also provided with brown paper.

The *bowing* commences by shovelling the material towards the right-hand partition with the basket, upon which the workman, holding the bow horizontally in his left hand, and the bow-pin in his right, lightly places the bow-string, and gives it a pluck with the pin. The string, in its return, strikes upon the fur, and causes it to spring up in the air, and fly partly across the hurdle in a light open form. By repeated strokes, the whole is thus subjected to the bow; and this beating is repeated till all the original clots or masses of the filaments are perfectly opened and dilated, and, having thus fallen together in all possible directions, form a thin mass or substance for the felt. The quantity thus treated at once is called a *batt*, and never exceeds half the quantity required to make one hat.

When the batt is sufficiently bowed, it is ready for *hardening*; which term denotes the first commencement of felting. The prepared material, being evenly disposed on the hurdle, is first pressed down by the convex side of the basket, then covered with a cloth, and pressed backwards and forwards successively in its various parts, by the hands of the workmen. This pressure brings the hairs closer to each other, and multiplies their points of contact; whilst their agitation gives to each hair a progressive motion towards the root; by means of this motion the hairs are twisted together, and the *lamellæ* of each hair, by fixing themselves to those of other hairs, which happen to be directed the contrary way, keep the whole in that compact state which the pressure makes it acquire. Upon this same disposition of the hairs to felting, the hair-balls, or *ægagropila*, formed in the stomachs of

hairy animals which lick themselves, are alone to be accounted for. In proportion as the mass becomes compact, the pressure of the hands is increased; not only to make it more close, but also to keep up the progressive motion and twisting of the hairs, which then takes place with greater solidity; but throughout the whole of this operation, the hairs fix themselves only to each other, and not to the linen cloth with which they are covered. It may here be proper to explain why that hair which is intended for making hats is always *cut off* with a sharp instrument, (although that cannot be done without losing a part of its length,) and not *plucked* out by the roots, as might be done after softening the skin; the reason is, the bulb of the hair, which in the latter case would come out with it, would render that end which was fixed in the skin thick and obtuse; and it would consequently be less disposed to introduce itself among the contiguous hairs, and to contribute by its progressive motion to the contexture of the mass. But this conformation of the surface of hairs and wool, is not the only cause which produces their disposition to felting. It is not sufficient that every hair possesses the before-mentioned tendency to move progressively towards the root, and that the inclined *lamellæ*, by hooking themselves to each other, preserve the mass in that state to which compression has brought it: but it is also necessary that the hairs *should not be straight*, like needles; if they were so, pressing and rubbing them together would merely cause them to continue their progressive motion, without changing their direction; and the effect of those operations would only be to make them move from the centre of the mass without producing the requisite compactness. Every hair must therefore be twisted or curled in such a manner, that the extremity which is towards the root may be disposed to change its direction perpetually, to twist itself about other hairs, and to incline towards itself again, in case it should be determined thereto by any change in the position of the rest of its length. It is because wool has naturally this crooked form that it is so proper for felting, and that it may be made use of for that purpose without undergoing any previous preparation. But the hairs of the beaver, the rabbit, the hare, &c. being naturally straight, cannot so well be employed in felting, till they have undergone a preliminary operation; which consists in rubbing or combing them, before they are taken off the skin, with a brush dipped in a solution of mercury in aqua-fortis (nitric acid). This liquor, acting only on one side of the substance of the hairs, changes their direction from a right line, and gives them that disposition to felting which wool naturally possesses. When the hairs are not intended to enter into the body of the mass,

but are only to be employed in making a sort of external coating, such as is given to the outer surface of hats with a long flow or nap, the operation just mentioned need not be performed; but the felt on which they are to be fixed being finished, the hair is uniformly spread upon the surface to which the coating is to be applied; and, being covered with a cloth, it is pressed with the hands, and agitated for a certain time. By these means the hairs introduce themselves, by the root, a certain depth into the felt, and are there fixed by their *lamellæ* in such a manner as not to be easily extracted. A particular direction is afterwards given to them by means of a brush, and they are made to keep this direction by having a hot iron passed over them. If the agitation were continued for a longer time, these hairs, not having their straightness destroyed by the operation above described, would pass entirely through the felt, going out at the opposite surface; as each hair follows exactly the direction it acquired at the beginning. It is owing to the very same circumstances which make wool and hair capable of felting, that woollen cloth is thickened by fulling.

When the felt has acquired the necessary firmness and consistence, intended to be given to it by the above-mentioned agitation and pressure, the cloth is taken off, and a sheet of paper, with its corners doubled in, so as to give it a triangular outline, is laid upon the batt, which last is folded over the paper as it lies, and its edges, meeting one over the other, form a conical cap. The joining is soon made good by pressure with the hands on the cloth. Another batt, ready hardened, is in the next place laid on the hurdle, and the cap here mentioned placed upon it, with the joining downwards. This last batt, being also folded up, will consequently have its place of junction diametrically opposite to that of the inner felt, which it must therefore greatly tend to strengthen. The principal part of the intended hat is thus put together, and now requires to be worked with the hands a considerable time upon the hurdle, the cloth being also occasionally sprinkled with clear water. During the whole of this operation, which is called *basoning*, the felt continually increases in firmness, and contracts in its dimensions. It may easily be understood, that the chief use of the paper is to prevent the sides from felting together. A superior method is said to be, that after the bowing, and previous to the basoning, a hardening skin of leather, alumed, or half tanned, should be used instead of the cloth, and pressed upon the batt, to bring it by an easier gradation to a compact appearance. This operation of basoning derives its name from the process or mode of working being the same as that practised upon a wool-hat after bowing; the last being done upon a

piece of cast metal, three feet across, of a circular shape, called a *bason*; the joining of each batt is made good here by the motion of the hand, that is, by rubbing, the edges of each batt folded over the other to excite the progressive action of the filaments in felting, and to join the two together.

The basoning is followed by a still more effectual continuation of the felting, called *working*. This is done at an apparatus called a *battery*, consisting of a kettle (containing water slightly acidulated with sulphuric acid, to which, for beaver hats, a quantity of wine-lees or the grounds of beer is added, or else plain water for rinsing out), and eight planks of wood joined together in the form of a frustum of a cone, and meeting in the kettle at the middle. The outer or upper edge of each plank is about two feet broad, and rises a little more than two feet and a half above the ground; and the slope towards the kettle is considerably rapid, so that the whole battery is little more than six feet in diameter. The quantity of sulphuric acid added to the liquor, is not sufficient to give a sour taste, but only renders it rough to the tongue. In this liquor, heated rather higher than unpractised hands could bear, the felt is dipped from time to time, and worked on the planks; before which it is plunged gently into the boiling kettle till fully saturated with the liquor, called *soaking*; and is then laid on the plank to cool. The imperfections of the felt now present themselves to the eye of the workman, who picks out knots and other hard substances with a bodkin, and adds more fur upon all such parts as require strengthening. This added fur is patted down with a wet brush, and soon incorporates with the rest. Many hatters, to hurry this work, use a quantity of vitriol, (sulphuric acid,) and then, to make the nap rise and flow, they kill the vitriol, and open the body again by throwing in a handful of oat-meal; by this means they expedite their hats, but at the same time they leave them quite grainy from the want of labour. This, in handling the dry grey hat when made, may be in part discovered. The beaver for the nap is laid on towards the conclusion of this kind of working. The hat now possesses the form of a cone, and the whole of the several actions it has undergone have converted it into a soft flexible felt, capable of being extended, though with some difficulty, in any or every direction; therefore the next thing to be done, is to give it the form required by the wearer. For this purpose the workman turns up the edge or brim to the depth of about an inch and a half, and then returns the point back again through the centre or axis of the cap, so far as not to take out this fold, but to produce another inner fold of the same depth. The point being returned back again in the same manner, produces a third fold, and thus the workman proceeds until the

whole has acquired the appearance of a flat circular piece, consisting of a number of concentric undulations, rings, or folds, with the point in the centre. This is laid upon the plank, where the workman, keeping the piece wet with the liquor, pulls out the point with his fingers, and presses it down with his hand, at the same time turning it round on its centre in contact with the plank, till he has, by this means, rubbed out a flat portion equal to the intended crown of the hat. In the next place, he takes a block, to the crown of which he applies the flat central portion of the felt, and, by forcing a string down the sides of the block, causes the next part to assume the figure of the crown, which he continues to wet and work until it has properly disposed itself round the block. The brim now appears like a flounced or puckered appendage round the edge of the crown; but the block being set upright on the plank, the requisite figure is soon given by working, rubbing, and extending this part. Water only is used in this operation of fashioning or blocking; at the conclusion of which it is pressed out by the blunt edge of a copper implement used for that purpose, called a *stamper*.

Previous to the dyeing, the nap of the hat is raised, or loosened out, with a wire-brush, or carding instrument. The fibres are too rotten, after the dyeing, to bear this operation. The dyeing materials are logwood, a little oak-bark, and a mixture of the sulphates of iron, and of copper, known in the market by the common names of green copperas and blue vitriol. The hats are boiled with the log-wood, and afterwards immersed in the saline solution. The dyed hats are, in the next place, taken to the stiffening-shop. The workman has two vessels, or boilers, one containing the grounds of strong beer, and the other containing melted glue, a little thinner than what is used by carpenters. The beer-grounds are applied in the inside of the crown to prevent the glue from coming through to the face, and also to give the requisite firmness at a less expence than could be produced by glue alone. Were the glue to pass through the hat in different places, it would be more difficult to produce an even gloss upon the face in the subsequent finishing. The glue-stiffening is therefore applied after the beer-grounds are dried, and then only upon the lower face of the brim, and the inside of the crown. For this purpose, the hat is put into another hat, called a stiffening-hat, the crown of which is notched, or slit open in various directions. These are then placed in a hole in a deal-board, which supports the brim, and the glue is applied with a brush. In France, however, they use wine-lees in lieu of beer-grounds, and gum-water instead of glue.

The dry hat, after this operation, is always rigid, and its figure irregular. The last dressing is given by the application of moist-

ure and heat, and the use of the brush, and a hot iron, as before mentioned, somewhat in the shape of that used by tailors, but shorter and broader on the face. The hat being softened by exposure to steam, is drawn upon a block, to which it is securely applied by the former method of forcing a string down from the crown to the commencement of the brim. The judgment of the workmen is employed in moistening, brushing, and ironing the hat, in order to give and preserve the proper figure. When the brim of the hat is not intended to be of an equal width throughout, as is oftentimes the case for military hats, it is cut by means of a wooden or metallic pattern. The contrivance for cutting them round, is very ingenious and simple. A number of notches are made in one edge of a flat piece of wood for the purpose of inserting the point of a knife, and from one side or edge of this piece of wood, there proceeds a straight handle, which lies parallel to the notched side, forming an angle somewhat like that of a carpenter's square. When the legs of this angle are applied to the outside of the crown, and the board lies flat on the brim of the hat, the notched edge will lie nearly in the direction of the radius, or line pointing to the centre of the hat. A knife being therefore inserted in one of the notches, it is easy to draw it round by leaning the tool against the crown, and it will cut the brim very regular and true. This cut is made before the hat is quite finished, and is not carried entirely through; so that one of the last operations consists in tearing off the redundant part, which by that means leaves an edging of beaver round the external face of the brim. When the hat is completely finished, the crown is tied up in gauze paper, which is neatly ironed down. It is then ready for the subsequent operations of lining, &c. for sale.

The principal improvements which have been made of late years in the manufacture of hats have been,

1st. Giving them any colour that is desired, which is described in the specification of a patent obtained in 1782, to be done after the following manner:—The nap of the hat to be raised by means of a card, on the side intended to be dyed, and then boiled in alum and argol. A thin paste should be made of flour or clay, which is spread over every part that is not to be dyed, and then closed; or the hat may be previously pasted, and instead of being boiled, it should only be simmered in the same liquor. As soon as the paste is spread, plates of copper or other metal, shaped like a common funnel, are fixed over the paste, to prevent the dye from penetrating through. In this state the hat is immersed in the dye, till the colour is sufficiently fixed, when it is taken out, opened, and cleansed from the paste; but if any colouring particles have penetrated through the

felt, they may be removed by rubbing them with a small quantity of spirit of salt, aquafortis, &c.

2dly, By a process which is denominated *carroting*, i. e. mixing mole fur and rabbits' wool, and by the introduction of substitutes for the more expensive parts of the composition of hats.

3dly, By what is called *re-beavering* hats, which is by adding a nap to old hats which are become smooth by wear. Much imposition is practised by some who pretend to re-beaver hats; but if done effectually, the hat is reduced to its original state, and nearly the same process is repeated as has been already described in manufacturing new hats of the coarser kinds, on which an adventitious nap is to be imposed.

A patent was obtained in 1794, by one Dunnage, for a water-proof hat, made in imitation of beaver. The articles employed are a mixture of silk with fur, made into an excessively thin covering, which is stretched over a frame of chip properly formed into the shape of a hat. They are somewhat heavier than the common hats, but preserve their colour *better*, and the nap *longer*; they are what they profess to be, water-proof, but the chip being formed into shape by means of size or glue, they are affected by damp, and easily put out of shape, if care be not taken of them. They will not bear to be brushed, but are preserved bright and clean by gentle rubbing with a damp sponge.

By 24 Geo. 3. c. 21. hare skins, hare wool, coney wool, and undressed coney skins are prohibited to be exported under a penalty of 50*l.* as a protection to the manufacturers of hats; and any person dyeing the same shall forfeit 20*l.*

And for the further encouragement of the said manufacture, Turkish goats' hair shall be imported duty free.

HATS of *chip*, *straw*, or *cane*, are made by platting, and sewing the plats together; beginning with the centre of the crown, and working round till the whole is finished.

Hats for the same purpose are also woven, and made of horse-hair, silk, &c. The capital for this trade requires only a single guinea to purchase the machines and materials for employing 100 persons for several months. The straw is cut at the joints; and the outer covering being removed, it is sorted of equal sizes, and made up into bundles of eight or ten inches in length, and a foot in circumference. They are then to be dipped in water, and shaken a little so as not to retain too much moisture; the bundles are afterwards to be placed on their edges, in a box which is sufficiently close to prevent the evaporation of smoke. In the middle of the box is an earthen dish containing brimstone broken in small pieces; this is set on fire, and the box covered over and kept in the open air several hours. It is the business of one person to split and select the

straws for fifty others who are braiders: The splitting is done by a small machine made principally of wood. The straws, when split, are termed splints, of which each worker has a certain quantity: on one end is wrapped a linen cloth, and they are held under the arm, and drawn out as wanted. Platters should be taught to use their second fingers and thumbs, instead of the forefingers, which are often required to assist in turning the splints, and very much facilitates the platting, and they should be cautioned against wetting the splints too much. Each platter should have a small linen work-bag, and a piece of paste-board to roll the plat round. After five yards have been worked up, it should be wound about a piece of board half a yard wide, fastened at the top with yarn, and kept there several days to form it in a proper shape. Four of these parcels, or a score, is the measurement by which the plat is sold.

The finest species of straw, and chip, hats are those imported from Leghorn, though it is well known that the greater number of these articles sold at London, and in other parts of the kingdom, as Italian hats, are made in Great Britain; after all, however, the Italians infinitely excel us, as well in the materials, as the manufacture.

HATCHEL, HACKLE, HECKLE, or HITCHEL, (*Hatchels.* GER. *Hecheln.* DU. *Hekels.* DA. *Hægler.* SW. *Häklor.* FR. *Serans.* IT. *Pettini.* SP. *Rastrillos.* RESTELLOS. RUS. *Tschesalki.* POL. *Ochlicy*.) a tool with which flax and hemp are combed into fine hairs. It consists of long iron pins or teeth, regularly set in a piece of board. There are several sorts of hatchels, each finer than the other, with which flax and hemp are prepared for spinning.

HATCHES, in a ship, a kind of trap-doors between the main-mast and fore-mast, through which all goods of bulk are let down into the hold.

Hatches also denote flood-gates set in a river, &c. to stop the current of the water: particularly certain dams, or mounds made of rubbish, clay, or earth, to prevent the water that issues from the stream-works and tin-washes in Cornwall, from running into the fresh rivers.

HATCHING, or HACHING, in designing, &c. the making of lines with a pen, pencil, graver, or the like; and the intersecting or going across those lines with others drawn a contrary way, is called counter-hatching. The depth and shadows of draughts are usually formed by hatching.

HATCHWAY, the way or passage over the hatch of a ship.

HATTOCK, a stock of corn containing twelve sheaves: others make it only three sheaves laid together.

HAUL, or HALE, an expression peculiar to seamen, implying to pull a single

rope, without the assistance of blocks or other such mechanical powers.

"To haul the wind," is to direct the ship's course nearer to that point of the compass from which the wind arises.

HAUTBOY, a musical instrument of the wind kind, shaped much like the flute, only that it spreads and widens towards the bottom, and is sounded through a reed. The treble is two feet long; the tenor goes a fifth lower, when blown open: it has only eight holes; but the bass, which is five feet long, has eleven.

HAWKERS and **PEDLARS**, are such dealers or itinerary petty chapmen as travel to different fairs or towns with goods or wares, and are placed under the controul of commissioners, by whom they are licensed for that purpose, pursuant to stat. 8 and 9 Will. 3. c. 25. and 50 Geo. 3. c. 41.

All hawkers, pedlars, petty chapmen, and every other person, trading from town to town, or to other men's houses, and travelling either on foot or with horses, carrying to sell, or exposing to sale, any goods, wares, or merchandizes, shall pay a duty of 4*l.* per annum; and persons travelling with any horse, ass, mule, or other beast, bearing or drawing burden, shall pay an additional 4*l.* for every such beast, over and above the afore-mentioned duty.

Persons applying for licences, to produce a certificate of their good character, signed by the clergyman of the parish, and two reputable inhabitants.

Hawkers are to mark upon all their packages, carts, waggons, or other vehicles of conveyance, and every room or shop in which they shall trade, and upon every handbill or advertisement they distribute, the words, *Licensed Hawker*, with the number, name, and distinction, written or painted upon the respective licences, in large Roman capitals, under penalty of 10*l.* for every offence. Persons unlicensed so marking their packs, to forfeit 10*s.*

Hawkers, pedlars, &c. selling smuggled goods, or goods fraudulently procured with their privacy and knowledge, shall forfeit their licences, and be incapable of obtaining a new one, exclusive of the penalties which may attach upon them from such illicit traffic.

No hawker, &c. can open any room or shop, or expose to sale any goods, wares, or merchandizes, in any town or place where he is not an householder, or the same not being the usual place of his abode, or carrying on business to sell any goods or merchandize whatsoever, by outery, hammer, candle, lot, parcel, or any other mode of sale at auction, under penalty of 50*l.* for every such offence.

Persons forging, counterfeiting, or travelling with forged and counterfeited licences, are liable to a penalty of 500*l.*; and persons lending or letting their licences to hire, or

trading with borrowed licences, shall forfeit 40*l.*; such licence shall be void, and the person lending it shall be incapable of having it renewed.

Any person whatsoever may seize and detain any hawker who shall be travelling without a licence, or refuse to produce such licence, until he can give notice to some peace-officer, who shall carry the person so detained, unless he shall in the mean time produce his licence, before some magistrate; and such magistrate, if the party produce no licence, is to levy 40*l.* by warrant of distress upon the owner of the goods, rendering to such owner the overplus.

Any person or persons authorised by two commissioners, shewing such authority, or upon demand of any justice of the peace, mayor, constable, or other officer, where the hawker shall trade, or by any officer of the customs or excise, may demand any hawker found travelling, to produce a licence according to this act; and upon refusal, or not having his licence ready to produce, shall forfeit 10*l.*; and for non-payment thereof, the magistrate may levy the same by distress and sale of goods, and may in the mean time commit the offender to gaol, until the distress is levied or the penalty paid.

Constables, &c. refusing to act in execution of this act, to forfeit 10*l.*

Hawkers, although licensed, vending their wares in any place where an order of quarter-sessions shall have been made to prohibit them, shall forfeit 10*l.*

Nothing in these acts shall prohibit any persons from selling any printed papers, licensed by authority, or any fish, fruits, or victuals, nor to hinder persons who are the real workers or makers of any goods, wares, or manufactures of Great Britain, their children, apprentices, agents, or servants, from carrying abroad, exposing to sale, and selling by retail or otherwise, any of such goods, wares, or manufactures, in any market or fair, and in every city, borough, town corporate, and market town, nor any tinkers, coopers, glaziers, plumbers, harness-menders, or other persons, usually trading in mending kettles, tubs, household goods, or harness, from going about, and carrying with them proper materials for mending the same.

No wholesale dealer in British goods, selling from house to house, to be deemed a hawker. 52 Geo. 3. c. 108.

Hawkers or pedlars offering for sale any tea, or spirituous liquors, although having permits for the same, such articles shall be seized and forfeited. See title *GROCER*.

A licensed auctioneer conveying goods by public stage waggons, from place to place, and selling them by commission, is a pedlar or trading person within 50 Geo. 3. c. 41. and must take out a hawker's licence. *Rev v. Turner*, 4 B. & A. (K. B.) 510.

So where the goods consisted of very large quantities of books sent after him by public

conveyances, and sold by retail and by auction. *Dean, q. t. v. King. Ibid.* 517.

A licensed hawker opening a room in a place, he not being a householder there, and that not being the usual place of his abode, and selling there by retail, does not thereby commit an offence within the statute, 50 G. 3. c. 41. s. 7. To constitute such an offence, the selling must be by outcry, &c., or some mode of sale at auction. *Allen v. Sparkall, 1 B. & A. 100.*

The penalties above 20*l.* are recoverable in the courts at Westminster, half to the king and half to the informer; under 20*l.* before a magistrate, with appeal to the quarter-sessions. Witnesses neglecting to appear, or refusing to be examined upon oath, forfeit 10*l.*

HAWSER, a large rope, or a kind of small cable, for various uses on board a ship.

HAWSES, in a ship, are two large holes under the bow, through which the cables run. Thus the hawse-pieces are the large pieces of timber in which these holes are made.

Hawse-bags, are bags of canvas made tapering, and stuffed full of oakum; which are generally allowed small ships, to prevent the sea from washing in at the hawse-holes; and hawse-plugs are plugs to stop the hawses, to prevent the water from washing into the inanger. A bold hawse is when the holes are high above the water. *Fresh the hawse*, that is lay new pieces upon the cable in the hawses, to preserve it from fretting. "Burning in the hawse," is when the cables endure a violent stress. "Clearing the hawses," is disentangling two cables that come through different hawses. "To ride hawse-full," is when in stress of weather the ship falls with her head deep in the sea, so that the water runs in at the hawses.

HAY, (GER. *Hew.* DU. *Hovi.* DA. *Høe.* SW. *Hü.* FR. *Foin.* IT. *Fieno.* SP. *Heno.* PORT. *Feno.* RUS. *Sjeno.* POL. *Siano.* LAT. *Fænum*.) any kind of grass, cut and dried, for the food of cattle. Regulations concerning the hay-market, and the selling of hay and straw, within the bills of mortality and thirty miles of the cities of London and Westminster, are enacted by 36 Geo. 3. c. 88. According to it, no hay or straw shall be sold within the expressed limit, but in trusses, the weight of which is regulated, as well as the number of trusses in each load. Penalties are inflicted for light weight, bad quality, for forestalling, regrating, for fraudulent delivery, for giving false receipts, and for salesmen and factors dealing on their own accounts, &c. &c.

HAZEL-NUTS, (GER. *Haslenüsse.* DU. *Hazelnooten.* DA. *Hasselnodder.* SW. *Haselnüßter.* FR. *Noisettes, Avelines.* IT. *Nocciuole, Avellane.* SP. *Avellanas.* PORT. *Avellãas.* RUS. *Orechi.* POL. *Laskowy orzech.* LAT. *Avellanae*.) the fruits of the hazel or common nut-tree. The kernels of the fruit have a mild, farinaceous, oily taste, agreeable to most palates. Squirrels and

mice are fond of them, as well as some birds, such as jays, nut-crackers, &c. A kind of chocolate has been prepared from them, and there are instances of their having been formed into bread. The oil expressed from them is little inferior to the oil of almonds; and is used by painters and chemists for receiving and retaining odours. The trees that produce these nuts are all of the large shrub kind, hardy and deciduous; and have several varieties valuable for their nuts, as also for their variety in large wildernesses and shrubbery walks. They will prosper in almost any situation, and turn to good account when growing in coppices, to cut as underwood, and as poles in various uses; as hoops, spars, hurdles, handles to husbandry-implements, walking-sticks, fishing-rods, &c. for which purpose they may be cut every fifth, seventh, or eighth year, according to the purposes for which they are designed. The best method of propagating them is by layers, though they may also be raised from the nuts.

HEAD-LAND, a promontory, or a cape.

HEAD-LINES, in a ship, those ropes of all sails which are next to the yards, and by which the sails are made fast to the yard.

HEAD-MATTER, the brains and blubber of the head of the South Sea spermaceti whale. This head-matter is packed in casks, and spermaceti prepared from it.

HEAD-SEA, is when a great wave or billow of the sea comes right a-head of the ship, as she is in her course.

HEAD-SAILS, in a ship, those which belong to the fore-mast and bow-sprit; for it is by these that the head of the ship is governed, and made to fall off and keep out of the wind; and these in quarter-winds are the chief drawing sails.

HEAD of a ship, or other vessel, is the prow or that part which goes foremost.

HEDERÆ, see GUM-HEDERÆ.

HEEL, in the sea language. If a ship leans on one side, whether she is aground or afloat, then it is said she heels a-starboard, or a-port; or that she heels offwards, or to the shore, i. e. inclines more to one side than to another.

HELIOTROPE, a word derived immediately from the Greek language, and signifying a "turning to the sun." It has been, from this derivation, applied to sun-dials, and other instruments connected with the science of astronomy; to certain plants, in that of botany; and, lastly, to certain articles, in that of mineralogy. In the last-mentioned science, it is given to a precious stone of a green colour, streaked with red veins. Pliny says it is thus called, because, when cast into a vessel of water, the sun's rays falling on it seem to be of a blood colour, and that, when out of the water, it gives a faint reflec-

tion of the figure of the sun, and is proper to observe eclipses of the sun as a helioscope. The heliotrope is also called oriental jasper, on account of its ruddy spots. It is found in the East Indies, as also in Ethiopia, Germany, &c. According to Dr. Thompson, the colour of this stone is different shades of green, often stained or striped with olive, yellow, and red. Found in mass, and in angular pieces, brittle, and infusible before the blow-pipe. Its specific gravity 2.6.

HELLEBORE. (GER. *Nieswurz*. DU. *Nieswortel*. DA. *Nyserod*. SW. *Prustrot*. FR. *Elébore*. IT. *Elleboro*. SP. *Vedegambre*. PORT. *Heleboro*. RUS. *Tschemeriza*. POL. *Ciemierzycza*. LAT. *Helleborus*.) the name of several rosaceous-flowered plants. Those employed medicinally are,

1. *Fetid, Black Hellebore*, called also *Setterwort*, and *Bear's Foot*. The root of this plant is small, surrounded by numerous dark-coloured fibres, involved very intricately. The stem rises to about a foot and a half in height. The plant grows wild in many parts of England, and flowers about February; its smell, when recent, is extremely fetid; the taste bitter, and remarkably acrid. It is chiefly used as a vermifuge; the dried leaves in powder are given from five grains to ten. A single green leaf infused in water is sufficient for three doses for a child seven years old. This is a popular remedy, and is a very efficacious one; but must not be used without medical advice, as the effects of an over-dose are fatal.

2. *Black Hellebore*, commonly called *Christmas Flower*, *Christmas Rose*, and *Melampodium*. It is a low plant, without any stalk; the leaf is divided quite to the pedicle, into six, seven, or more, smooth round segments, resembling bay-leaves, indented from about the middle to the extremity. The flower is large, naked, pentapetalous, of a pale rose colour, with numerous stamina in the middle, followed by five or six pods full of shining black seeds; the petals remaining, and turning greenish. The root consists of numerous fibres, hanging generally from a knotty head, externally of a blackish colour, internally white. It is perennial, grows wild in the mountainous parts of Germany and Switzerland, and flowers in our gardens in January.

The taste of the root is bitter and pungent, and when chewed for a few minutes it benumbs the tongue.

It is a very active cathartic in large doses, and proves useful in many disorders which affect persons of a torpid habit of body, acting, in smaller doses, as a general stimulus.

White Hellebore.—This plant has large, oval, ribbed leaves, placed alternately on a round stalk, which they embrace by a tubular basis. The root is short, commonly near an inch thick, with numerous fibres hanging

from it, externally of a brownish colour, internally more white. When fresh, it has a disagreeable smell, and a nauseous, bitter, pungent taste. It is common on mountainous places in Switzerland and Germany; and occurs in Italy, and even in Russia. This is, probably, not the same with the hellebore of the ancients, so celebrated for the cure of insanity; that appears rather, from the synonyms in Caspar Bauhine's *Pinax*, to be a species of anemone.

White hellebore acts as a violent emetic and purgative, producing great heat about the throat and fauces, and an increase of all the secretions. It is not often employed internally. As an external application, in the form of a decoction, it is very beneficial in many diseases of the skin; particularly the itch, which it frequently cures very speedily.

Hellebore is cultivated with success in this country, and in different parts of France, and in the Levant. The hellebore of the Levant is looked upon as the best of any that has hitherto been met with. It is sometimes mixed in external applications for destroying cutaneous insects.

HELM of a ship, is a piece of timber fastened into the rudder, which comes forward into the steerage, or place where the person at the helm steers the ship, by holding the whipstaff in his hand, which is joined to the helm. Steering-wheels are now more generally used. There are several terms in the sea-language relating to the helm: as, "bear up the helm;" that is, let the ship go more large before the wind: "helm a midship," or "right the helm;" that is, keep it even with the middle of the ship; "port the helm;" put it over to the left side of the ship: "starboard the helm;" put it on the right side of the ship.

HEMP, (GER. *Hanf*. DU. *Hennip*, *Kennip*. DA. *Hamp*. SW. *Hampa*. FR. *Chanvre*. IT. *Canape*. SP. *Canamo*. PORT. *Canhamo*, *Linhocanhamo*. RUS. *Konapli*, *Konapel*. POL. *Konop*. LAT. *Cannabis*.) a valuable plant which grows wild in the East Indies, and is cultivated to a very considerable extent in Britain.

It does not appear that the ancients were acquainted with the use of hemp, in respect of the thread it affords. Pliny, who speaks of the plant in his natural history, lib. xx. cap. 25., says not a word of this; contenting himself with extolling the virtues of its stem, leaves, and root. In effect, what some writers of the Roman antiquities remark, viz. that the hemp necessary for the use of war was all stored up in two cities of the western empire, viz. at Ravenna, and Vienne, under the direction of two procurators, called *procuratores linificii*, must be understood of linum or flax.

The use of hemp is so extensive and important, that vast quantities of it are annually imported into this, and other, kingdoms,

from those countries where it grows in greatest plenty, of which Russia and Poland are the principal.

Only the coarser kinds of hemp are employed in making cordage; the better sorts being used for linen, which, though it can never be made so fine as that from flax, is yet incomparably stronger, and equally susceptible of bleaching, both in the old, and new manner. Cloths made of hemp have also this property, that their colour improves by wearing, while that of linen decays. The prices of hemp-linen are various: from 10*d.* to 4*s.* 6*d.* per yard. The low-priced kinds are very generally worn in Suffolk, where hemp is cultivated, by husbandmen, farmers, &c.; those from 1*s.* 6*d.* to 2*s.* by farmers and tradesmen; and those from 2*s.* 6*d.* to 4*s.* 6*d.* are frequently preferred by gentlemen to flax-linen, on account of their strength and warmth. The English hemp is much superior in strength to that which grows in any other country. Next to it is the Russian, from which sacking is usually made, as it is sometimes also from the offal of the English kind; but none of the Suffolk hemp is ever made into cordage, on account of its fineness. A considerable quantity of Russia sheeting is imported into England merely on account of its strength, and is much coarser at the price than any other foreign linen.

Besides these uses of hemp, it is said to possess a property as a plant which renders it almost invaluable; viz. that of driving away almost all insects that feed upon other vegetables. Hence in some places of the continent they secure their crops from these mischievous attacks, by sowing a belt of hemp round their gardens, or any particular spot which they wish to preserve.

The important uses of hemp, and the superiority of that produced in Britain to other kinds, have rendered the culture of it an object of attention to government. Accordingly, in the year 1787, a bounty of three-pence per stone was allowed on all the hemp raised in England; and duties have been laid on that which comes from abroad. The export of British hemp is free.

The usual height of the plant when growing is from five to six feet, but this varies very considerably according to circumstances. That which is cultivated in Alsace is sometimes more than twelve feet high, and upwards of three inches in circumference, the stalks being so deeply rooted that a very strong man can scarce pull them up. Mr. A. Young, in a tour through Catalonia in Spain, says, that where the country is well watered, the crops of hemp are extraordinary; and that the plants generally rise to the height of seven feet. In Italy hemp is generally cultivated, though the Bolognese only can pretend to any superiority in the management of it. It is there sown upon their best lands, which are rich

strong loams; and on which they are at all possible pains to procure a fine friable surface. For manure they use dung, pieces of rotten cloth, feathers, and horns brought from Dalmatia. The plant, however, may be cultivated upon ground of every kind; the poorer land producing that which is finer in quality, though in smaller quantity; whereas strong and rich land produces a great quantity, but coarser. It does not exhaust the land on which it grows like flax. It may be raised for many years successively on the same ground, provided it be well manured. An acre requires from nine to twelve pecks, according to the nature of the soil; the latter being the most usual, though a variation in the quality of the soil makes an alteration both in the quantity, and quality, of the hemp. An acre produces on an average 36 or 38 stone. The season for sowing it extends from the 25th of March to the 15th of June. The seed ought always to be thin, not exceeding two bushels to an acre; and with the advantage of a drill-plough, still less will answer. As there are two kinds of hemp, the male, and female, of which the former only produces seed, regard must be had to this circumstance. In Sussex the male, and female, are pulled together about thirteen weeks after the sowing, but in the fens they are frequently separated. This last method is recommended, and little paths should be made lengthwise through the field, at about seven feet distance from each other, to allow a passage for the person who pulls up the female hemp from among the other; the latter requiring to stand more than a month after for the purpose of ripening the seeds. The female hemp is known to be ripe by the fading of the flowers, the falling of the farina fecundans, and some of the stalks turning yellow. After the whole of this kind is pulled, it must be manufactured according to the directions to be afterwards given, and ought to be worked if possible while green; the hemp thus produced being much finer than that which is previously dried. The reason of this is, that the plant contains a great quantity of glutinous matter; which being once dried, agglutinates the fibres in such a manner that they can never be afterwards perfectly separated. The female hemp, however, is always in smaller quantity than the male; and therefore where the crop is large, it will be impossible to work the whole as fast as it is pulled or cut. It is known to be ripe by the stems becoming pale; but it must be remembered, that hemp of any kind will be much less injured by pulling the plants before they are ripe, than by letting them stand too long.

The male hemp being stripped of its leaves, &c. as afterwards directed, will soon be dry for storing by the heat of the atmosphere, though sometimes it may be necessary to use artificial means; but where these are

used, the utmost care must be taken, hemp, when dry, being exceedingly inflammable. The stored, or dried, hemp must be steeped and treated in every other respect as though it had been green; whence it is evident that this operation ought never to be used but in cases of necessity. It is likewise impossible to make hemp, which has been dried previous to its being steeped, so white, as that which has been worked green.

After the hemp is pulled, it must be taken in large handfuls, cutting off the roots (though this is not absolutely necessary), the leaves, seeds, and lateral branches, being dressed off with a wooden sword or ripple. It is then to be made up into bundles of twelve handfuls each, in order to be steeped, like flax, in water. This, or something similar, is absolutely necessary, in order to separate the bark, which is properly the hemp, from the reed or woody part. In Suffolk this operation is called water-retting; but sometimes a mere exposure to the air is substituted in its place, turning the hemp frequently during the time it is exposed. This is called dew-retting; but the former method is universally deemed preferable. Such hemp as is designed for seed is seldom water-retted. Dew-retted hemp is generally stacked and covered during the winter; in January and February it is spread upon meadow land, and whitens with the frost and snow; though it is always much inferior to the other, and proper for coarser yarns only.

The length of time required for steeping hemp is various, and a complete knowledge of it can only be attained by practice. In Suffolk it is usual to continue the immersion four, five, or six days; standing water is preferred, and the same water will steep hemp three times during the season, but the first has always the best colour. Some prefer clear and running water, especially if overhung with trees. The bundles are to be laid crosswise upon each other, taking particular notice of the manner in which they lie when put in, that they may be taken out without difficulty. The time of steeping is from six to eleven days; and here we must observe, that it is much better to let it remain too long in the water than too short a time. The slenderest hemp requires the most soaking. The operation is known to be finished by the reed separating easily from the bark.

After the hemp is thoroughly steeped, the next operation is to separate the bark from the reed or woody part; and this may be done in two ways, viz. either pulling out the reed from every stalk with the hand, or drying and breaking it like flax. This last operation, called *reeding*, may be performed either in a trough under water or upon a table. The whole, however, may be reduced to the following, viz. pressing down the bundles either in a trough, or on a table,

by proper weights, to keep the hemp steady in the middle and top end. Then beginning at the upper part of the bundle, pull out the reeds one by one. As you proceed, the rind which remains will press closely upon the remaining unreeded hemp, and keep it more steady; so that you may take two, four, or even six stalks at a time. The weight is then to be removed from the top, and all the pieces of reed which remain there, having been broken off in the former operation, are to be taken out. Lastly, the middle weight is to be taken off, and any small pieces which remain there taken out. If the reeding is performed on a table, the bundle must be weeded frequently, though slightly; a continual dropping of water would perhaps be the best method.

After the hemp is reeded, it must next be freed from the mucilaginous matter with which it still abounds. This is done by pouring water through it, squeezing out the liquid after every affusion, but taking care not to let the threads twist or entangle each other.

Hemp is broken by machinery, after being steeped, in a manner similar to flax; but the instruments used for this purpose in Suffolk are all worked by the hand. That which breaks in the operation is called *shorts*, and is about half the value of the long hemp.

Beating is the next operation, which formerly was performed entirely by hand, but now in most places by a water-mill, which raises three heavy beaters that fall upon it alternately; the hemp being turned all the while by a boy in order to receive the strokes equally. The finer it is required to make the tow, the more beating is necessary. It is then dressed or combed by drawing it through heckles formed like the combs of wool-manufacturers, only fixed. Sometimes it is divided into two or three sorts of tow, and sometimes the whole is worked together into one sort; the prices varying from 6d. to 1s. per pound.

The hemp thus manufactured is sold to spinners, who reel their yarn as follows:

2 yards make	1 thread.
40 threads	- 1 lea.
20 leas	- 1 skain.
5 skains	- 1 clue of 4800 yds.

It is next delivered to the bleachers, who return it bleached on receiving 20 or 21 clues for every 120 bleached.

By 33 Hen. 8. c. 17., hemp or flax shall not be watered in any running stream, or common pond, under pain of 40s.

By 15 Car. 2. c. 15., any person, native or foreigner, may freely exercise the trade of dressing and using hemp, flax, or make tapestry hangings, twine, knots, or cordage, and after three years shall have the privilege of natural-born subjects.

HEMP-SEED, (GER. *Hanfsaat*. DU. *Hennipzaad*, *Kennepzaad*. DA. *Hampfrøe*.

Sw. Hampfrö. Fr. Chenevis, Chenevi. It. Canapuccia. Sp. Canamon. PORT. Linhaça do canhamo. Rus. Konopljanoë Semja. Pol. Siemi Konepniawie. LAT. Semen cannabinum,) the seed which produces hemp. It is deemed a good medicine in coughs, but its great virtues are against the jaundice.

The best hemp-seed for producing a crop is that which looks brightest, and will not break when rubbed. It should always be of the growth of the preceding year, and also the produce of some different soil. Nothing is better for the food of domestic fowls. It will feed those which are designed for the table, and will make laying hens very prolific.

HEPATIC ALOES. The inspissated juice of the common aloe, a native of Barbadoes, and other West India islands. Its smell is stronger and more disagreeable than the soccotrine aloes; the taste is uncommonly bitter and nauseous.

The best hepatic aloes come from the island of Barbadoes in large gourd-shells; an inferior sort, which is generally soft and clammy, is imported in casks. See ALOES.

HERRINGS, (GER. *Hüringe, Heringe. Du. Haringen. DA. Sild. Sw. Sill. Fr. Harengs. It. Aringhe. Sp. and PORT. Arenques. Rus. Seldi. Pol. Sledzie.*) No herrings shall be sold in any vessel, unless the barrel contain 32 gallons, and in the same proportion for the half barrel and firkin. Such fish are also directed to be well packed, and all of the same salting, and to be as good in the middle of the cask as at the ends, under the penalty of 3s. 4d. each barrel; and all vessels containing herrings are to be marked with the quantity they contain, and the place where packed. Sworn packers are also employed at all fishing-ports, under penalty of 100*l.* See FISHERY.

HIDE of land, such a quantity of land as may be ploughed with one plough within the compass of a year, or so much as would maintain a family; some call it 60, some 80, and some 100 acres.

HIDES, (GER. *Häute. Du. Huiden. DA. Huder, Hunder. Sw. Hudar. Fr. Peaux. It. Cuoja. Sp. Pellejos, Pielles. PORT. Pelles. Rus. Koshi. Pol. Skory,*) signify, generally, the skins of beasts; but the term is more particularly applied to those of large cattle, such as bullocks, cows, horses, &c.

Hides are either raw or green; that is, the same as when taken off the carcase, or salted and seasoned, in which case they are dressed with salt, alum, and saltpetre, to prevent them from putrefying, or they are cured or tanned.

The hides of South America are in the highest repute, and vast quantities of them are annually imported into Great Britain. Ireland also, where so many heads of cattle are slaughtered for provision, supplies England with horse, cow, and ox hides of very

excellent quality. These are mostly imported in the hair. When sent to foreign countries they are usually salted. See title CURRIERS.

HINGES, (GER. *Häspen, Thürangeln. Du. Herren, Hengzels. DA. Dorhager. Sw. Dorhakar. Fr. Gonds. It. Arpioni, Gangheri. Sp. Goznes, Quicios. PORT. Gonzos, Conceiras,*) are joints made of brass, iron, &c. on which gates, doors, lids and covers of boxes, trunks, &c. turn. They are principally manufactured at Birmingham, Wolverhampton, and in the neighbourhood of all these places, of all sizes and descriptions.

HITCH, in the sea-language, is to catch hold of any thing with a hook or rope, and by this means to hold it fast: thus when a boat is to be hoisted in, the sailors say, hitch the tackles into the ring-bolts of the boat; and when they are about to weigh anchor, hitch the fish-hook to the fluke of the anchor.

HIVE, (*Bee-hives. GER. Bienenkörbe. Du. Biekorven. DA. Biekurve. Sw. Biekorgar, Bikupor. Fr. Ruches, Paniers. It. Arnie. Sp. Colmenas. PORT. Colmeas, Corticos. Rus. Ueli. Pol. Uly,*) a convenient receptacle for bees, which is frequently formed of glass, but more commonly of platted straw, woven in the shape of a dome.

HOCK, a German wine of exquisite flavour when old. The best comes from Frankfort on the Maine, whence it is brought to us in casks called *aumes*, each of which contains 140 gallons. See WINE.

HOG, on board of a ship, is a sort of flat scrubbing broom, formed by inclosing a number of short twigs of birch or some such like wood between two pieces of plank fastened together, and cutting off the ends of the twigs. It is used to scrape the filth from a ship's bottom under water. For this purpose they fit to this broom a long staff with two ropes; one of which is used to thrust the hog under the ship's bottom, and the other to guide and pull it up again close to the planks.

HOGS' BRISTLES. See BRISTLES.

HOGSHEAD, a measure of capacity, containing sixty-three gallons. A hogshead is equal to half a pipe.

HOLLAND, a fine close kind of linen cloth, so called from its being first manufactured in Holland; but this kind of linen is now made in Ireland, and also in Scotland, in as great perfection as in any other part of the world.

HOLLAND, NEW. An island in that part of the globe lately distinguished by the appellation of Australasia, and entitled to a separate consideration here, as belonging to none of the four continents already described, and at the same time partaking of the qualities to entitle it to the denomination of a continent itself.

Its length from E. to W. is about 45 de-

grees of longitude; being 2730 British miles; and its breadth from N. to S. extends from 11° to 39°, being 1960 British miles. Comprehending in the estimate a great number of inferior islands in its vicinity, the area of this last discovered portion of the terraqueous globe is more than equal to that of Europe. It has been discovered only about two centuries, and not attempted to be peopled by Europeans till within about 40 years, when the loss of that receptacle for the off-scourings of an exuberant population, the largest portion of British America, obliged the government to look out for some other refuge for expatriated criminals. A considerable district on the eastern coast of this country was then seized, and appropriated to the purpose, under the denomination of New Holland; and, as it does not seem probable that any other power will speedily have the means of placing any limit to our colonization, it bids fair to rival, in interest and importance, some other of our possessions; which the man must be blind indeed who does not foresee will, at some future period, slip from our grasp, as the principal part of the North American continent has already done. Nature has done her part, even liberally, toward making this country a valuable possession; cultivation and commerce may, ere long, do the rest. The soil of the principal island abounds in coal, and some of the adjacent ones have lime-stone. There is plenty of timber, of at least an useful kind, if not equal to the produce of Europe: pines flourish luxuriantly, and furnish an extremely hard wood; and the gum-tree grows to an immense size. There are indeed but few kinds of animals fit for food, but cattle of all kinds imported from other countries thrive well, and increase abundantly. Water-fowl are in excessive plenty, and the coasts excel in various kinds of fish, and incredible numbers of turtle. There are fine bays, and excellent harbours for shipping. Wheat, maize, and most of the vegetables, which have been introduced from Europe, grow well; and there is no reason to doubt that various others from different parts of the world would succeed with proper care and cultivation, as the general state of the climate is mild and salubrious; and though occasionally subject to drought and storms, not more frequent in occurrence, nor more injurious in their effects, than in the West India islands, and other parts of the foreign dominions of Great Britain. Flax and wool have already afforded specimens of great promise for an export commerce. Their imports are necessarily confined to the wants of an infant colony, but these are rapidly increasing. Not an inconsiderable number of ready-made clothes shops, especially among the Jews, in London, derive their chief support from their intercourse with New Holland.

HOLLANDS. See GENEVA.

HONEY, (GER. *Honig*. DU. *Honig*, *Honing*. DA. *Honning*. SW. *Honing*. FR. *Miel*. IT. *Mele*. SP. *Miel*. PORT. *Mel*. RUS. *Med*. POL. *Miod*. LAT. *Mel*.) a saccharine substance prepared by bees. It has a white and yellowish colour, a soft and grained consistence, a saccharine and aromatic smell. By distillation it affords an acid phlegm, and an oil, and its coal is light and spongy, like that of the mucilage of plants. Nitric acid extracts from it oxalic acid precisely as it does from sugar; it is very soluble in water, with which it forms a syrup, and like sugar passes to the vinous fermentation. There are three distinctions of honey, according to its purity, fluidity, and the manner in which it has been procured from the honey-combs. The first and finest kind is virgin honey, or the first produce of a swarm, obtained from the combs without pressing; these being only set to drain, in order to its running out. The second kind is that known by the name of white honey, being thicker than the former, and often indeed almost solid; it is procured by pressing the combs, but without the assistance of heat. The third and worst kind is the common yellow honey, obtained from the combs first heated over the fire, and then pressed. It is frequently adulterated with flour, sugar, &c.; the best way, therefore, of buying it is in the comb.

By stat. 23 Eliz. c. 8. s. 4. All vessels of honey are to be marked with the initial letters of the name of the owner, on pain of 6s. 8d. and be of such a content, as follows: the barrel 32 gallons, the kilderkin 16 gallons, and the firkin 8 gallons, on pain of 5s. for every gallon wanting; and if any honey sold, be corrupted with any deceitful mixture, the seller shall forfeit the honey, &c.

HOOFs of ANIMALS. The hoofs of animals are composed of a substance nearly of the same nature as horn. They are not applied to any use, but to afford ammonia and animal coal, in the preparation of the prussiat of potash, and in the case-hardening of iron.

HOOKS, (GER. *Haken*. DU. *Haaken*. DA. *Hager*. SW. *Hakar*. FR. *Croos*, *Crochets*. IT. *Ganci*, *Uncini*. SP. and PORT. *Ganchos*. RUS. *Kajuki*. POL. *Haki*.) pieces of iron, or other metal, properly tempered and bent, and employed for various purposes. Such are fish-hooks, boat-hooks, meat-hooks, &c.

HOOPS, (GER. *Reifen*, *Fassreifen*. DU. *Hoepen*, *Banden*. DA. *Tindebaand*. SW. *Band*. FR. *Cercles*, *ou Cerceaux*. IT. *Cerchi*. SP. *Aros*, *Cellos*. PORT. *Arcos*. RUS. *Ob-rutschii*. POL. *Obroozy*.) are made of wood, and also of iron, for the purpose of binding such vessels as are used for domestic purposes, for the conveyance of liquids, &c. Iron hoops are exported to Spain, Portugal, the island of Madeira, and to our colonies in the West Indies, where they are employed

for hooping the pipes and butts of wine, the rum puncheons, &c. &c. Iron designed for making hoops should be remarkably well tempered.

HOPS. (GER. *Hopfen*. DU. *Hoppe*. DA. *Humble*, *Humble*. SW. *Humla*. FR. *Houblon*. IT. *Luppoli*, *Bruscandoli*. SP. *Oblon*. PORT. *Luparo*, *Lupolo*. RUS. *Chmel*. POL. *Chmiel*. LAT. *Humulus*, *Lupulus*.) Of hops there is only one species, the *lupulus*, which is sometimes found wild in the hedges near houses and gardens, but probably it is not indigenous. The stalk is weak and climbing; it creeps up the support in a spiral, ascending always from the right hand to the left.

Hops are said to have been first brought into England from the Netherlands, in the year 1524. They are first mentioned in the English statute-book in the year 1552, viz. in the 5th and 6th Edw. 6. c. 5.; and by an act of parliament of the first year of James 1. anno 1603, c. 18. it appears that hops were then produced in abundance in England. The hop being a plant of great importance in this country, we shall consider what relates to the culture, and management, of it, under distinct heads.

The soil.—As to the choice of soil, the hop-planters esteem the richest and strongest ground the most proper; and if it is rocky within two or three feet of the surface, the hops will prosper well; but they will by no means thrive on a stiff clay, or spongy wet land. The Kentish planters account new land best for hops; they plant their hop gardens with apple-trees at a large distance, and with cherry-trees between; and when the land has done its best for hops, which they reckon it will in about ten years, the trees may begin to bear.

To plant hops.—In the winter time provide your soil and manure for the hop-ground against the following spring. If the dung be rotten, mix it with two or three parts of common earth, and let it incorporate together till you have occasion to make use of it in making your hop-hills; but if it be new dung, then let it be mixed as before till the spring in the next year, for new dung is very injurious to hops. Hops require to be planted in a situation so open that the air may freely pass round and between them, to dry up and dissipate the moisture, which often destroys the middles of large plantations, while the outsides remain unhurt.

The hills should be eight or nine feet asunder. If the ground be intended to be ploughed with horses between the hills, it will be best to plant them in squares, chequer-wise; but if the ground is so small that it may be done with the breast-plough or spade, the holes should be ranged in a quincunx form. Which way soever you make use of, a stake should be stuck down at all the places where the hills are to be made. Be very particular in the choice of the plants as to

kind; for if the hop-garden be planted with a mixture of several sorts of hops, that ripen at several times, it will cause much trouble, and great detriment.

The two best sorts are the white, and the grey bind; the latter is a large square hop, more hardy, bears more abundantly, but ripens later than the former. There is another sort of the white bind, which ripens a week or ten days before the common; but this is tenderer, and a less plentiful bearer; though it has this advantage, that it comes first to market. If there be a sort of hop you value, and would wish to increase, the superfluous binds may be laid down when the hops are tied, cutting off the tops, and burying them in the hill; or when the hops are dressed, all the cuttings may be saved; for almost every part will grow, and become a good set the next spring.

Seasons of planting hops.—The Kentish planters approve the months of October and March. The most usual time of procuring the cuttings is in March, when the hops are cut and dressed. As to the manner of planting the sets, there should be five good sets planted in every hill, one in the middle, and the rest round about, sloping. Let them be pressed close with the hand, and covered with fine earth; a stick should be placed on each side of the hill to secure it.

Dressing hops.—When the hop-ground is dug in January or February, the earth about the hills, and very near them, ought to be taken away with the spade, that you may come the more conveniently at the stock to cut it. About the end of February, if the hops were planted the spring before, or if the ground be weak, they ought to be dressed in dry weather; but if the ground be strong and in perfection, the middle of March will be a good time; and if it is apt to produce over-rank binds, the beginning of April, may be soon enough. Then having, with an iron picker, cleared away all the earth out of the hill, so as to clear the stock to the principal roots, with a sharp knife you must cut off all the shoots which grew with the binds the last year; and also all the young suckers, that none be left to run in the alley, and weaken the hill. It will be proper to cut one part of the stock lower than the other, and also to cut that part low that was left highest the preceding year. In dressing those hops that have been planted the year before, you ought to cut off both the dead tops and the young suckers which have sprung up from the sets, and also to cover the stocks with fine earth, a finger's length in thickness.

The poling of hops.—About the middle of April the hops are to be poled, when the shoots begin to sprout up; the poles must be set to the hills deep in the ground, with a square iron picker or crow, that they may the better endure the winds; three poles are sufficient for one hill. These should be

placed as near the hill as possible, with their bending tops turned outwards from the hill, to prevent the binds from entangling; and a space between two poles ought to be left open to the south, to admit the sun-beams.

The tying of hops.—The buds that do not clasp of themselves to the nearest pole when they are grown to three or four feet high, must be guided to it by the hand, turning them to the sun, whose course they will always follow. They must be bound with withered rushes, but not so close as to hinder them from climbing up the pole. This you must continue to do till all the poles are furnished with binds, of which two or three are enough for a pole; and all the sprouts and binds that you have no occasion for, are to be plucked up; but if the ground is young, then none of these useless binds should be plucked up, but should be wrapped up together in the middle of the hill.

The gathering of hops.—About the beginning of July hops begin to blow, and will be ready for gathering about Bartholomew-tide. A judgment may be made of their ripeness by their strong scent, their hardness, and the brownish colour of their seed. When by these tokens they appear to be ripe, they must be picked with all the expedition possible; for if at this time a storm of wind should come, it would do them great damage, by breaking the branches, and bruising and discolouring the hops; and it is very well known, that hops, being picked green and bright, will sell for a third more than those which are discoloured and brown.

The most convenient way of picking them is into a long square frame of wood, called a bin, with a cloth hanging on tenter-hooks within it, to receive the hops as they are picked. They must be picked very clean, *i. e.* free from leaves and stalks; and as there shall be occasion, two or three times in a day, the bin must be emptied into a hop-bag made of coarse linen cloth, and carried immediately to the oast or kiln in order to be dried; for if they should be long in the bin or bag, they will be apt to heat and be discoloured. If the weather be hot, there should no more poles be drawn than can be picked in an hour, and they should be gathered in fair weather, if it can be, and when the hops are dry; this will save some expense in firing, and preserve their colour better when they are dried.

Drying of hops.—The best method of drying hops is with charcoal on an oast or kiln, covered with hair-cloth of the same form and fashion that is used for drying malt. The kiln ought to be square, and may be of ten, twelve, fourteen, or sixteen feet over at the top, where the hops are laid, as your plantation requires, and your room will allow. There ought to be a due proportion between

the height and breadth of the kiln, and the beguels of the steddle where the fire is kept; *viz.* if the kiln be twelve feet square on the top, it ought to be nine feet high from the fire, and the steddle ought to be six feet and a half square, and so proportionable in other dimensions.

The hops must be spread even upon the oast, a foot thick or more, if the depth of the curb will allow it; but care is to be taken not to overload the oast if the hops are green or wet. The oast ought to be first warmed with a fire before the hops are laid on, and then an even steady fire must be kept under them; it must not be too fierce at first, lest it scorch them, nor must it be suffered to sink or slacken, but rather be increased till the hops are nearly dried, lest the moisture or sweat which the fire has raised fall back or discolour them. When they have lain about nine hours they must be turned, and in two or three hours more they may be taken off. It may be known when they are well dried, by the brittleness of the stalks, and the easy falling off of the hop-leaves.

Bagging of hops.—As soon as the hops are taken off the kiln, lay them in a room for three weeks or a month to cool, give, and toughen; for if they are bagged immediately, they will powder, but if they lie a while, (and the longer they lie the better, provided they are covered close with blankets to secure them from the air,) they may be bagged with more safety, as not being liable to be broken to powder in treading; and this will make them bear treading the better, and the harder they are trodden the better they will keep.

The laws relating to hops are extremely numerous. In the first place, those for their protection; secondly, those which make them a subject of duty.

The 6 Geo. 1. commonly called the Black Act, enacts, that if any person shall maliciously cut any hop binds growing on poles, he shall be guilty of felony *sans* clergy.

9 Anne, c. 12. prohibits brewers from using other bitters to serve as substitutes for hops, under a penalty of 20*l.*

By 42 Geo. 3. c. 88. and 56 Geo. 3. c. 58. not only brewers are prohibited from using, but druggists are also prohibited from selling to brewers, any substitute for malt or hops, under a penalty of 500*l.*

By 9 Ann. c. 121. an additional duty of 3*d.* a pound is laid on all hops imported, over and above all other duties; and hops landed before entry and payment of duty, or without warrant for landing, shall be forfeited and burnt; (the ship also shall be forfeited, and the person concerned in importing or landing shall forfeit 5*l.* a hundred weight, 7 Geo. 2. c. 19;) and hop-grounds are required to be entered on pain of 40*s.* an acre. Places of curing and keeping are also to be

entered, on pain of 50*l.* which may be visited by an officer at any time without obstruction, under the penalty of 20*l.* All hops shall, within six weeks after gathering, be brought to such places to be cured and bagged, on pain of 5*s.* a pound.

The re-bagging of foreign hops in British bagging, for sale or exportation, incurs a forfeiture of 10*l.* a hundred weight; and defrauding the king of his duty, by using twice or oftener the same bag, with the officer's mark upon it, is liable to a penalty of 40*l.* Concealment of hops subjects the concealer to the forfeiture of 20*l.* and the concealed hops; and any person who shall privately convey away any hops, with intent to defraud the king and owner, shall forfeit 5*s.* a pound. And the duties are required to be paid within six months after curing, bagging, and weighing, on pain of double duty, two-thirds to the king, and one-third to the informer.

By 49 & 50 Geo. 3. c. 81. the grower of hops is to give 24 hours' notice to the excise officer of his intention to weigh, under a penalty of 50*l.*; and shall keep true weights and scales for the purpose, under a penalty of 100*l.*; and shall assist in weighing, under a penalty of 50*l.*; and shall not suffer any officer of excise inferior to a supervisor to weigh between five o'clock in the evening and four in the morning, under a penalty of 20*l.*; and shall mark on his bags, before bagging, his name and place of abode in durable paint or ink, under a penalty of 20*l.*; and the weight of each bag shall be no greater than in the proportion of 10*lb.* to the gross weight of bag and hops together of 112*lb.* under a penalty of 20*l.*; and the officer shall put his mark on each bag, and counterfeiting the said mark, shall be subject to a penalty of 100*l.*, and defacing the same, to a penalty of 20*l.*

By 48 Geo. 3. c. 134. the grower shall also mark on each bag the name of the parish and county where the hops were grown, under a penalty of 20*l.*; and obliterating the same, shall be subject to a like penalty. By 54 Geo. 3. c. 23. the letters of the said mark shall be four inches in length, and half an inch in breadth, for the name of the person, and of three inches length and half an inch breadth, the name of the parish, &c. under a penalty of 20*l.*; and shall not put the name of any other person, parish, or county on the same than the true one, under a like penalty; and shall not put hops of different values and qualities into the same bag, under a penalty of 20*l.* for every such bag.—*Adulterating* (by which is intended also any process to give them a false colour) hops is made subject to a penalty of 5*l.* per hundred weight, by 7 Geo. 2. c. 19. See, on this subject, 6 Term R. 674. R. v. Pack.

The hops principally sold in the London market are those of Kent, Sussex, Essex, and Farnham, the last mentioned of which

are usually sold in *pockets* only. These sell at nearly double the price of the other growths. The principal hop-factors reside in the borough of Southwark, where all hops are sold by sample.

HOREHOUND, or the **WATER OF GIPSEYWORT**, an indigenous perennial plant, growing on the banks of streams and ponds.

The French manufacturers are chiefly indebted to this plant for the deep black colour of their cloths; its juice imparts a permanent dye to wool, silk, and linen.

HORN, (GER. *Da.* and Sw. *Horn.* Du. *Hoorn.* FR. *Corne.* IT. *Corno.* SP. *Cuerno.* *Asta.* *Hasta.* PORT. *Corno.* RUS. and POL. *Rog.* LAT. *Cornu.*) a hard substance growing on the heads of animals, particularly the cloven-footed quadrupeds; and serving them both as weapons of offence, and defence. Horns are not very hard, as they may be easily cut with a knife, or rasped with a file; but they are so tough, as not to be capable of being pounded in a mortar.

When in thin plates they have a degree of transparency, and have been sometimes substituted for glass in windows. When heated sufficiently, they become very soft and flexible, so that their shape may be altered considerably. Hence they may be gradually squeezed into a mould and wrought into various forms. Horns make a considerable article in the arts and manufactures. Bullocks' horns, softened by the fire, serve to make lanthorns, combs, handles for knives, ink-horns, tobacco-boxes, &c. Glue is sometimes made of the raspings or shavings.

Dyeing of horns.—*Black* is performed by steeping brass in aqua-fortis till it is turned green: with this the horn is to be washed once or twice, and then put into a warmed decoction of logwood and water.

Green is begun by boiling it, &c. in alum-water; then with verdigris, ammoniac, and white-wine vinegar, keeping it hot therein till sufficiently green.

Red is begun by boiling it in alum-water; and finished by decoction in a liquor compounded of quick-lime steeped in rain-water, and to every pint an ounce of Brazil wood added. In this decoction the bone, &c. is to be boiled till sufficiently red.

Dyeing or staining horn to imitate tortoise-shell.—The horn to be dyed must be first pressed into proper plates, scales, or other flat form, and the following mixture prepared: Take of quick-lime two parts, and litharge one part; temper them together to the consistence of a soft paste, with soap-ley. Put this paste over all the parts of the horn, except such as are proper to be left transparent, in order to give it a near resemblance of the tortoise-shell. The horn must remain in this manner covered with the paste till it is thoroughly dry; when, the paste being brushed off, the horn will be found partly opaque and partly transparent, in the

manner of tortoise-shell, and when put over a foil of the kind of latten, called orsedue, will be scarcely distinguishable from it. It requires some degree of fancy and judgment to dispose of the paste in such a manner as to form a variety of transparent parts, of different magnitudes and figures, to look like the effect of nature: and it will be an improvement to add semi-transparent parts, which may be done by mixing whitening with some of the paste, to weaken its operation in particular places, by which spots of a reddish-brown will be produced, which if properly interspersed, especially on the edges of the dark parts, will greatly increase the beauty of the work, and its similitude to real tortoise-shell. British horns, unwrought, may not be transported, or sold to strangers, upon forfeiture of double their value. 4 Edw. 4. c. 8. s. 1. 1 Jac. 1. c. 25. s. 44. 7 Jac. 1. c. 14. s. 4.

HORN-BEAM. This is a very valuable tree, and grows to a large size: the wood is very tough and white, and will burn like a candle; it is much used by turners, is very useful for various implements of husbandry, and is wrought into cogs for the wheels of mills, presses, &c. which are far superior to those manufactured of other wood.

The inner bark gives a permanent colour to yarn.

HORNERS are artificers whose business it is to prepare various utensils of the horns of cattle.

The horners were a very ancient company in the city of London, being incorporated 12th January, 1638. To protect their trade from the intrusion of foreigners, a statute, 6 Edw. 4. was made, by which the sale of horns to foreigners (except such as the said horners refused) was prohibited; and the wardens had certain powers granted them to search all the markets in London, &c. This law was repealed in the reign of James I. but the horners again applied to parliament, and king Edward's statute was renewed, and still remains in force. The importation of unwrought horns into this country is also prohibited.

HORN-PRESSER. This is an art which requires more strength than ingenuity. The horns of oxen are cut into several rings about an inch and a half broad, and being held over the fire, these rings, when softened by the heat, are cut and pulled open with a pair of pincers. They are then placed between hot iron plates, and pressed with great force till they are spread, and become as thin as is necessary; this operation is repeated, in order to make the horns for lanterns, horn-books, &c. by heating fresh irons, and again putting them in the press till they become transparent and thin.

HORSE, (GER. *Pferd.* DU. *Paard.* DA. *Hest.* SW. *Häst.* FR. *Cheval.* IT. *Cavallo.* SP. *Caballo.* PORT. *Cavallo.* RUS. *Loschad.* POL. *Kon.* LAT. *Equus*.) a domestic qua-

druped, very useful in agriculture, commerce, war, hunting, racing, &c. Horses are distinguished into divers kinds, with regard to their country, as the Arabian, Neapolitan, Spanish genet, Barbarian, Dutch, English, Flemish, &c.; with regard to their uses, as race-horse, war-horse, coach-horse, dray-horse, pack-horse, &c.; and with regard to their colours, as bay, dun, grey, black, &c.

The Arabian and Barbary coursers are the swiftest in the known world, and next to these rank the English racers. For the harness and for draught, the horses of England are deemed superior to most others, as well on account of their uncommon vigour and activity, as their extraordinary beauty.

No horse shall be exported without the king's licence, nor mare above the value of 6s. 8d. 11 Hen. 7. c. 13.

By 1 Ed. 6. c. 5. no horse or mare shall be exported without the king's licence, on forfeiture thereof, and of 40l.; and no mare shall be exported exceeding 10s. in price.

Although the above acts remain on the face of the statute-book, they have long since fallen into total disuse and non-observance, particularly as subsequent acts, from 22 Car. 2. down to the present time, allow of the exportation of horses, mares, or geldings of British breeding, at an export duty; and they do in fact make a considerable article of export to most parts of the world, especially Russia.

No person convicted of feloniously stealing a horse, mare, or gelding, shall have the privilege of clergy. 1 Edw. 6. c. 12. And not only all accessories before such felony done, but also all accessories after such felony, shall be deprived and put from all benefit of their clergy, as the principal, by statute heretofore made, is, or ought to be.

If a horse be stolen out of the stable, or other curtilage of a dwelling-house in the night-time, it falls under the denomination of burglary; if in the day-time, under that of larceny from the house; and in either case there was till lately a reward of 40l. for convicting an offender, and the prosecutor was entitled to a certificate, which would exempt him from all parish and ward-offices in the parish and ward where the burglary or larceny was committed, and which might be once assigned over, with the same exemption to the assignee, as to the original proprietor. But now by 58 Geo. 3. c. 70. the pecuniary rewards for convictions are done away, and the certificates of exemption from parochial, and other, offices, are declared not to be transferrable or assignable.

Horses, sale of. The property in horses is not easily altered by sale, without the express consent of the owner, 2 Inst. 719. for a purchaser gains no property in a horse that has been stolen, unless it be bought in a fair or market overt, according to the directions of the stats. 2 Phil. and Mar. c. 7. and 31 Eliz. c. 12.

Slaughtering horses.—Great abuses having arisen, and many horses having been stolen, from the facility and safety of disposing of them to those who kept slaughter-houses for horses, some regulations and restrictions seemed absolutely necessary for the prevention of the evil. These were accomplished by 26 Geo. 3. c. 71. and subsequent statutes. See title CURRIER.

Killing or maiming horses.—Where any person shall, in the night-time, maliciously, unlawfully, and willingly, kill or destroy any horses, sheep, or other cattle, of any person, every such offence shall be adjudged felony, and the offender shall suffer as in the case of felony. 22 & 23 Car. 2. c. 7. Offenders may be transported for seven years, either at the assizes or at the sessions, by three justices of the peace, one to be of the quorum. By the 9th Geo. 1. c. 22. commonly called the *black act*, if any person shall unlawfully and maliciously kill, maim, or wound any cattle, every person so offending, being thereof convicted in any county of England, shall be adjudged guilty of felony, and shall suffer death, as in cases of felony, without benefit of clergy. But not to work corruption of blood, loss of dower, nor forfeiture of lands or goods.

Prosecution upon this statute shall be commenced within three years from the time of the offence. If a horse, or other goods, be delivered to an inn-keeper or his servants, he is bound to keep them safely, and restore them when his guest leaves the house. 2 Black. 451.

By the custom of London and Exeter, if a man commit a horse to an inn-keeper, if he eats out his price, the inn-keeper may take him as his own, upon the reasonable appraisalment of four of his neighbours; which was, it seems, a custom arising from the abundance of traffic with strangers, that could not be known so as to be charged with an action. But though an inn-keeper in London may, after long keeping, have the horse appraised and sell him, yet, when he has had him appraised, he cannot justify the taking him to himself at the price he was appraised at. *Vin. Abr.* 233. Stat. 182 Geo. 4. repeals certain duties on husbandry horses, and makes perpetual several former acts for reducing other duties on horses and mules.

HORSE, in a ship, is a rope made fast to each yard-arm, and on which the men stand to furl the sails.

It is also a wooden frame with a rowel fixed in it, made use of by the riggers to woad ships' masts.

HORSE ALOES. (GER. *Ross aloë*. DU. *Paarde aloë*. DA. *Heste aloë*. SW. *Grof aloë*. FR. *Aloës caballin*. IT. *Aloë caballino*. SP. *Acibar cabalino*. PORT. *Azevra caballino*. LAT. *Aloë caballina*.) See ALOES.

HORSE-BREAD. Inn-keepers shall not make horse-bread. 13 Rich. 2. c. 8. 4 Hen. 4. c. 25. 21 Jac. 1. c. 21. Permitted to bake horse-bread, 32 Hen. 8. c. 41.

HORSE-CHESNUT, the common. A method is said to have been discovered of making soap, as also of preparing a paste, or size, from horse-chesnuts, which may be used preferably to that made of wheaten flour, by shoemakers, bookbinders, card manufacturers, and paper-hangers, in which no moths or vermin will breed.

The horse-chesnut is also said to have been advantageously employed in tanning: the husks, when burnt to coal, produce an excellent black water colour; the branches and leaves communicate a good brown in dyeing; the shells also produce a good brown water colour, and the timber is useful in building.

HORSE-DEALERS. Every person exercising the trade or business of a horse-dealer, must take out a licence from the stamp-office, for which he shall pay annually, if within London, Westminster, the bills of mortality, the parish of St. Pancras, or the Borough of Southwark, 25*l.* elsewhere 12*l.* 10*s.*

Horse-dealers so licensed shall cause the words "*licensed to deal in horses*" to be painted or written in large and legible characters, either on a sign hung out, or on some visible place in front of their house, gateway, or stables, under a penalty of 10*l.* 36 Geo. 3.; and if they carry on the said business without having obtained a licence under the act, shall be liable to be assessed to the duties on riding-horses, and shall deliver lists thereof as other persons.

HORSE-HAIR, (GER. *Pferdehaar*. DU. *Paardshaair*. DA. *Hestehaar*, *Hestetagl*. SW. *Hästhor*, *Tagel*. FR. *Crin de cheval*. IT. *Crine del cavallo*. SP. *Crin*. PORT. *Crina s. Sedas do cavallo*. RUS. *Scherst loschadinaja*. POL. *Włosie konskie*.) is principally used by upholsterers, for stuffing chairs, sofas, &c. also by saddlers, in their manufacture of saddles, &c. It is an article of great consumption in Great Britain and Ireland, and from the latter country vast quantities of the article are annually exported.

HOSIER. The hosiers sell silk, worsted, thread, and cotton hose, (or stockings,) night-caps, and gloves, linsey, and bays; also cotton, silk, and worsted pieces for waistcoats, breeches, &c. which some export, and others sell only by retail. Some employ looms themselves, and are in that respect stocking-weavers. The hosiery branches of manufacture are mostly carried on at Nottingham, Leicester, and Derby.

HOT-PRESSER. The business of a hot-presser is to render smooth, glossy, and in even folds, most sorts of woollen goods for sale, by means of hot-presses, made of steel plates and screws. In the same manner he presses paper and gives its surface a fine gloss. See PRESSING.

HOURL-GLASS. An ordinary chronometer, measuring time for one hour by two glass vessels, and sand, which descends in

a given quantity from one to the other. Almost every ship carries with her hour, half-hour, quarter of an hour, and minute-glasses.

HOVERING, is an expression used to denote the vessels which keep near to, or *hover about* the coasts, for the purposes of smuggling, and the statutes which have been made to encourage the seizure and condemnation of them, "*hovering acts*." These are numerous, but the principal ones are, 9 Geo. 2. c. 35. 19 Geo. 3. c. 69. 42 Geo. 3. c. 82. and 56 Geo. 3. c. 104.

HOY, a large decked boat, or coasting vessel.

HUDSON'S BAY COMPANY. See COMPANY.

HULKS, large vessels that have their gun-decks from 113 to 150 feet long, and from 31 to 40 broad. They will carry from 400 to 1000 tons. They chiefly serve to set masts into ships, &c.

HULL, in the sea language, is the main body of a ship, without either masts, yards, sails, or rigging. Thus to strike a hull in a storm, is to take in her sails, and to lash the helm on the lee side of the ship; and to hull, or lie a hull, is said of a ship whose sails are thus taken in and helm lashed a-lee.

HUMHUMS, a species of Bengal calico.

HUNDRED, is ten times ten, or the square of ten. The proportion of the profits in commerce is reckoned by the hundred, or so much per cent.

HUNDRED of a County, a well-known division of the English counties, first ordained by king Alfred. Each hundred had its court, which was only a large court baron, holden for the inhabitants of that hundred. They are fallen into general disuse, but are still preserved in some particular places. The courts of conscience, as they are called, in and about the metropolis, are remnants of this antiquated institution.

HUNDRED-WEIGHT, a weight of 112lb. avoirdupois.

HUNGARY-WATER, a distilled water, so denominated from a queen of Hungary, for whose use it was first prepared. It is now known to be only a distillation of rosemary flowers. Take of them two pounds, and of rectified spirits of wine two quarts; put them together, and distil them immediately in balneo. This spirit, though of German origin, is now principally manufactured in France, under the name of *Eau de Cologne*. Considerable quantities of it are imported into Great Britain, although the duties on it are extremely heavy. The Jesuits, who were much addicted to medical science, contributed largely to its celebrity, by prescribing the use of it extensively.

HUSO, the Danube whale, from which chiefly is obtained the glue called *ichthyocollo*, or *isinglass*. Fish-glue is a solid gela-

tinous substance obtained from certain large fish. It is brought to us from Muscovy, folded up in different forms. Such rolls, or cakes, as are composed of white, thin, transparent plates, which have no smell, and perfectly dissolve in water, are best.

HYACINTH, a pellucid gem, whose colour is, red, with an admixture of yellow. See ZIRCON.

HYDRO-CARBONATES, combinations of carbon with hydrogen. A gas of this name is obtained from moistened charcoal by distillation.

HYDROGEN GAS, is the gaseous fluid which is given out in such abundance in coal-mines, and is known under the name of *fire-damp* by the miners: it has also been termed *inflammable gas*. It is perpetually issuing from stagnant lakes, drains, &c. from decomposing animal and vegetable matter. The *ignes fatui*, or *Jack-a-lanterns*, seen in low marshy grounds and church-yards, arise from phosphuretted hydrogen gas, disengaged from putrefying animal bodies, which takes fire spontaneously on contact with the atmosphere. In combination with water it forms, in bulk, two parts of that fluid.

Hydrogen gas may be obtained artificially by the following process:—Take one part of iron or zinc filings, and introduce them into a tubulated retort; add two parts of sulphuric acid, previously diluted with four times its bulk of water. A violent effervescence immediately takes place, and the gas that is evolved may be collected in the usual way. It is the lightest body known; 100 cubic inches weigh at a mean temperature and pressure, 2.25 grains. It is elastic, transparent, and colourless; has no taste, a disagreeable smell, and though it may be respired for a short time, soon proves fatal.

It is highly combustible when pure. The flame of hydrogen, when pure, is of a white colour; but when carbon is held in solution, it is reddish. Nitrous gas passing into it, occasions a green flame. When it is mixed with seven or eight times its bulk of air, it burns rapidly and with detonation. Combined with oxygen, by combustion, it forms water. Combined with chlorine, in equal proportions, it forms muriatic acid gas, which, dissolved in water, constitutes muriatic acid.

Hydrogen gas has lately been employed for the production of artificial light; for this purpose it may be obtained sufficiently pure from pit-coal. (See GAS-LIGHT.) It has, from its lightness, been also used for filling air-balloons.

HYDROMEL, a fermented liquor, made of honey and water. It is more commonly known by the name of **MEAD**, which see.

HYDROMETER, an instrument much used for determining the specific gravities of liquids. The most accurate of these in-

struments was contrived by *Fahrenheit*. It is a metallic hydrometer, having a very slender stem, terminating in a small dish. The middle, or half-length of the stem, is distinguished by a fine line across. In this instrument every division of the stem is rejected, and it is always immersed to the line by means of weights put into the dish. Thus, as the part immersed is constantly of the same magnitude, and the whole weight of the hydrometer is known; this last weight, added to the weight in the dish, will be equal to that of the fluid displaced by the instrument. Consequently, as the whole weight of the hydrometer and its load, when adjusted in distilled water, is to 1.000; so is the whole weight, when adjusted in any other fluid, to the number expressing the specific gravity of that fluid.

HYGROMETER, or **HYGROSCOPE**, an instrument whereby to measure or ascertain the dryness or moisture of the atmospheric air; or, in other words, to ascertain the disposition of the atmosphere to deposit water in the shape of rain, or to absorb it and be fair weather.

HYPOCIST, (GER. *Hypocisten*, *Cisten-saft*. DU. *Hypocist*. DA. *Hypocistsaft*. SW. and FR. *Hypocist*. IT. *Ipcistide*. SP. *Hypocistide*. PORT. *Hypociste*, *Prtegas*. LAT. *Hypocistides succus*.) is an inspissated, shining black juice, of a rough, styptic, and sourish taste. It greatly resembles the juice of acacia. C. Bauhine terms it the inspissated juice, of the (*hypocistis subcisto*) undergrowth or excrescence of the cistus.

The herb which yields this juice grows abundantly in Provence, Languedoc, and some other parts of France; and is held there in some esteem as a slight astringent, but is in little request here.

HYPOTHECATE, (from the Lat. *hypotheca*, a pledge,) is the pledging or pawning of a ship for necessities. Thus if a ship be at sea and spring a leak, or be otherwise in

danger of being lost, or the voyage defeated, for want of provisions or other necessities, in these cases of extremity, the master may pledge, or hypothecate, the ship and goods, or either of them, for such necessities as are wanting; which power is impliedly given him, in constituting him master, and which he may exercise rather than that the ship should be lost, or the voyage defeated. *Roll. Abr.* 53. 2 *Black. Com.* 159.

But the master can only hypothecate where the calamity or want of necessities happened after the ship had put to sea. *Molloy*, 214. And in no case, but for the preservation of the ship, and completing her voyage. *Molloy*, 213.

And although the power of *hypothecation* be necessary for the navigation, without which masters could not get credit abroad, yet a master cannot make the owner *personally* liable by any contract of his: but only the ship and cargo by way of hypothecation. 6 *Mod.* 79. And therefore the admiralty court hath jurisdiction, so far as to subject the ship, but cannot proceed against the person, otherwise than is necessary to make him a party towards condemnation of the ship. *Molloy*, 214. 6 *Mod.* 70. But the master of a ship has no right to sell the cargo, except in cases of absolute necessity; and therefore, where in the course of a voyage the ship was wrecked, and some indigo was saved and sold by public auction, by the authority of the captain, acting *bonâ fide* according to the best of his judgment, for the benefit of all persons concerned, but the jury found that there was no absolute necessity for the sale, the court of King's Bench held, that the purchaser acquired no title; and the indigo having been sent to this country, the original owners were held entitled to recover its value. *Freeman v. The East India Company*, 5 B. & A. 617.

JAC

J, The ninth letter of our alphabet, used as a numeral, signifies no more than one; and stands for so many units as it is repeated; thus, I, one; II, two; III, three, &c. and when put before a higher numeral, it subtracts itself, as IV, four; IX, nine, &c. but when set after it, so many are added to the higher numeral, as there are I's added; thus, VI, is 5 + 1, or six; VII, 5 + 2, or seven; VIII, 5 + 3, or eight. The ancient Romans likewise used I for 500, CI for 1000, I for 5000, CCI for 10,000, I for 50,000, and CCCI for 100,000. Farther than this, as Pliny observes, they did not go in their notation, but when necessary, repeated the last number, as, CCCI for 200,000, CCCI for 200,000, CCCI for 300,000; and so on.

JACK, in mechanics, an instrument in common use used for raising heavy timber,

JAC

or very great weights of any kind, being a powerful combination of teeth and pinions; the whole is inclosed in a strong wooden stock or frame, and moved by a winch or handle.

JACK is also the name of a well-known engine in the kitchen, used for turning a spit. Here the weight is the power applied, acting by a set of pulleys; the friction of the parts, and the weight with which the spit is charged, are the forces to be overcome; and a steady, uniform motion is maintained by means of a fly.

The most common sorts of jacks for roasting meat are those moved by weight, consisting of a double set of wheels, a barrel, round which the rope fastened to the pulleys is wound, a perpetual screw, and a fly. Some of them have a multiplying wheel, or a wheel of a larger diameter, upon which the rope first goes, and then round

the barrel of the jack; as the barrel is four, or five, times less than the wheel, the jack is proportionably longer in going down, since every five turns of the barrel take off but one turn of the multiplying wheel.

The *smoke-jack* is generally moved by a fan of tin, or sheet-iron, placed horizontally in the chimney. This moves a wheel, round which the chain is placed by a pinion; and this fan being carried about by the smoke of the fire, the jack goes constantly, and having no weight, is never wound up.

Smoke-jacks are also sometimes moved by means of spiral flyers coiling about a vertical axle, and at other times by a vertical wheel, with sails like the float-boards of a mill.

JACK, in a ship, a flag hoisted up at the sprit-sail top-mast head.

JACOBUS, a gold coin, struck in the reign of King James I. of England, value twenty-five shillings.

JADE, (GER. *Nierenstein*. DU. *Nierensteen*. DA. *Nyresteen*. SW. *Njunpsten*. FR. *Pierre nephritique*, *Jade*. IT. *Pietra nefritica*. SP. *Nefritica*. PORT. *Nephritica*. RUS. *Potschetschnoi kamen*. POL. *Nerek polenie*. LAT. *Nephriticus lapis*.) or nephritic stone, a species of jasper. It is sometimes of a whitish milky colour, from China; but mostly of a greenish or deep green colour, from America. It gives fire with steel, is semi-pellucid like flint, does not harden in the fire, but melts by the solar heat in the focus of a burning lens. It is supposed to cure nephritic pains, by external application to the loins, and is therefore called *lapis nephriticus*.

JALAP, or **JALOP**, (GER. *Jalapp*. DU. *Jalappe*. DA. *Jalaprod*. SW. *Jalaprot*, *Purgerot*. FR. *Jalap*. IT. *Sciarappa*. SP. *Jalapa*. PORT. *Jalappa*, *Batatade purga*. RUS. *Jalap*. POL. *Jalapa*. LAT. *Jalapapa*.) is the root of a sort of convolvulus, which is a native of Chalapa, or Xalapa, situated between La Vera Cruz and Mexico, in South America, whence its name is derived. The leaves of this species of convolvulus are like those of ivy, but not so thick; the flowers are red, and have this remarkable property, that they open in the night, and shut again on the least appearance of the sun; whence the French call the plant *Belle de nuit*, the beauty of the night.

Jalap is brought over to us cut into transverse slices; which should be chosen dry, dark-coloured, heavy, close, full of resin, hard, and neither brittle nor pliable. It is a strong acrid purgative to the human race, but is eaten by hogs in large quantities without any detriment. Half an ounce of the juice, or a drachm of the resin, when reduced to powder, is an acrid purge. The leaves of this root, applied externally, are said to diminish dropsical swellings of the feet. The roots of jalap grown in Europe are by no means so strong as the American.

JAMAICA-PEPPER. (GER. *Piment*. DU. *Piement*, *Jamaikapeper*. DA. *Piment*, *Allehaande*. SW. *Kryddpeppar*. FR. *Piment des Anglois*, *Poivre de la Jamaïque*. IT. *Pepe garofanato*. SP. *Pimienta de Jamaica*, *Todaespecia*. PORT. *Amomo ou piment da Jamaica*. RUS. *Anglinskoi pere*. POL. *Pieprz Jamaicki*. LAT. *Piper Jamaicense*.) See PIMENTO.

JAMAICA-WOOD, is an appellation commonly bestowed upon mahogany, and all other kinds of wood the produce of the island of Jamaica. Properly speaking, however, it is only used to signify a species of speckled wood, (whereof mention is made in 15 Car. 2. c. 5.) from which cabinet-ware is manufactured. The tree which furnishes this speckled timber grows abundantly in the island of Jamaica: it is low and small, seldom exceeding the size of a man's leg. Jamaica-wood, properly so called, is not very frequently imported into Great Britain.

JAMDANNIES, a species of Bengal muslin.

JAPAN, a kind of cane, called also *Wangee*.

JAPANING, is properly the art of varnishing and painting ornaments on wood, in the same manner as is done by the natives of Japan, in the East Indies. The substances which admit of being japanned are almost every kind that are dry and rigid, or not too flexible; as wood, metals, leather, and paper, prepared for the purpose. Wood and metals do not require any other preparation, but to have their surfaces perfectly even and clean; but leather should be securely strained, either on frames, or on boards; as its bending, or forming folds, would otherwise crack and force off the coats of varnish. Paper should be treated in the same manner, and have a previous strong coat of some kind of size; but it is rarely made the subject of japanning till it is converted into *papier maché*, or wrought by other means into such form, that its original state, particularly with respect to flexibility, is changed. One principal variation, from the method formerly used in japanning, is, the omitting any priming, or under-coat, on the work to be japanned. In the older practice, such a priming was always used; the object of which was to save in the quantity of varnish, by filling up the inequalities in the surface of the substance to be varnished. But there is this great inconvenience arising from the use of it, that the japan coats are constantly liable to be cracked, and to peel off, by any violence, and will not endure near so long as the articles that are japanned without any such priming.

The nature of japanned grounds.—When a priming is used, the work should first be prepared by being well smoothed with fish-skin or glass-paper; and being made thoroughly clean, should be brushed over once

or twice with hot size, diluted with two-thirds water, if it is of the common strength. The priming should then be laid on as evenly as possible, and should be formed of a size, of a consistency between the common kind and glue, mixed with as much whiting as will give it a sufficient body of colour to hide the surface of whatever it is to be laid upon, but not more. This must be repeated until the inequalities are completely filled up, and then the work must be cleaned off with Dutch rushes, and polished with a wet rag.

When wood or leather is to be japanned, and no priming is used, the best preparation is to lay two, or three, coats of coarse varnish, composed in the following manner:

Take of rectified spirit of wine one pint, and of coarse seed-lac, and resin, each two ounces; dissolve the seed-lac and resin in the spirit, and then strain off the varnish. This varnish, as well as all others formed of spirit of wine, must be laid on in a warm place; and if it can be conveniently managed, the piece of work to be varnished should be made warm likewise; and for the same reason, all dampness should be avoided; for either cold or moisture chills this kind of varnish, and prevents its taking proper hold of the substance on which it is laid. When the work is so prepared, or by the priming with the composition of size, and whiting, above described, the proper japan-ground must be laid on, (of which the best is that formed of shell-lac varnish,) and the colour desired, except white, which requires a peculiar treatment; and if brightness is wanted, then also other means must be pursued. The colours used with the shell-lac varnish may be any pigments whatever, which give the tint of the ground desired. As metals never require to be under-coated with whiting, they may be treated in the same manner as wood, or leather.

The method of painting japan-work.—Japan-work ought properly to be painted with colours in varnish; though, for the greater dispatch, and in some very nice work, for the freer use of the pencil, the colours are sometimes tempered in oil, which should previously have a fourth part of its weight of gum anime dissolved in it; or in default of that, gum sandarach, or gum mastic. When the oil is thus used, it should be well diluted with oil of turpentine, that the colours may lie more evenly and thin; by which means fewer of the polishing or upper coats of varnish become necessary. In some instances, water-colours are laid on grounds of gold, in the manner of other paintings; and are best, when so used in their proper appearance, without any varnish over them; and they are also sometimes so managed, as to have the effect of embossed work. The colours employed in

this way, for painting, are best prepared by means of isinglass-size, corrected by honey or sugar-candy. The body, of which the embossed work is raised, need not, however, be tinged with the exterior colour, but may be best formed of very strong gum-water thickened to a proper consistence by bole armenian and whiting in equal parts; which being laid on the proper figure, and repaired when dry, may be then painted with the proper colours, tempered with isinglass-size, or, in the usual manner, with shell-lac varnish.

The manner of varnishing japan-work.—The finishing of japan-work depends on the laying on, and polishing, the outer coats of varnish, which are necessary, as well in the pieces that have only one simple ground of colour, as with those that are painted. This is in general done best with common seed-lac varnish, except in the instances, and on those occasions, where particular methods are deemed to be more expedient; and the same reasons which decide as to the fitness or impropriety of the varnishes, with respect to the colours of the ground, hold equally with regard to those of the painting. For where brightness is the most material point, and a tinge of yellow will injure it, seed-lac must give way to the whiter gums; but where hardness and a greater tenacity are most essential, it must be adhered to; and where both are so necessary, that it is proper one should give way to the other, in a certain degree reciprocally, a mixed varnish must be adopted. This mixed varnish, as we have already observed, should be made of the picked seed-lac. The common seed-lac varnish, which is the most useful preparation of the kind hitherto invented, may be thus made: Take of seed-lac three ounces, and put it into water, to free it from the sticks and filth that are frequently intermixed with it; which must be done by stirring it about, then pouring off the water, and adding fresh quantities, in order to repeat the operation, till it is freed from all impurities, as is very effectually done by this means: dry it then, and powder it grossly, and put it, with a pint of rectified spirit of wine, into a bottle, of which it will not fill above two-thirds. Shake the mixture well together, and place the bottle in a gentle heat, till the seed-lac appears to be dissolved; the shaking being in the mean time repeated as often as may be convenient; then pour off all that can be obtained clear by this method, and strain the remainder through a coarse cloth. The varnish, thus prepared, must be kept for use in a bottle well stopped. When the spirit of wine is very strong, it will dissolve a greater proportion of the seed-lac; but this quantity will saturate the common, which is seldom of a strength sufficient to make varnishes in perfection.

The manner of using the seed-lac, and the white varnish, is the same, except with regard to the substance used in polishing: which, where a pure white of a great clearness of other colours is in question, should be itself white, whereas the browner sorts of polishing dust, as being cheaper, and doing their business with greater dispatch, may be used in other cases. The pieces of work to be varnished, should be placed near a fire, or in a room where there is a stove, and made perfectly dry: and then the varnish may be rubbed over them by the proper brushes made for that purpose, beginning in the middle, and passing the brush to one end, and then with another stroke from the middle, passing it to the other; but no part should be crossed, or twice passed over, in forming one coat, where it can possibly be avoided. When one coat is dry, another must be laid over it; and this must be continued at least five or six times, or more, if on trial there be not sufficient thickness of varnish to bear the polish, without laying bare the painting or ground-colour underneath. When a sufficient number of coats is thus laid on, the work is fit to be polished; which must be done, in common cases, by rubbing it with a rag dipped in tripoli, or rotten stone, finely powdered; but, towards the end of the rubbing, a little oil of any kind should be used along with the powder; and when the work appears sufficiently bright and glossy, it should be well rubbed with the oil alone, to clear it from the powder, and give it a still brighter lustre.

A patent was several years ago obtained by one Eyre of Sheffield, for a method of impressing japan upon the ornamented handles of knives and other articles: this process, which is very simple, is as follows:

As soon as the pattern is impressed on the handle, &c. it is taken out of the press, (having been previously marked so as to be replaced in the same situation,) and the japan is laid on. The press is then heated to a certain degree, and the japanned article returned to it, by which means the varnish is pressed in, and rendered more firm and capable of receiving a high polish.

This method is applicable to ornamented handles of knives and forks, &c. made of wood or paper, in imitation of carved horn or bone.

JAPANNED WARES, (GER. *Japanische ware*. DU. *Japansch lakwerk*. DA. *Japonisk varer*. SW. *Japonish varor*. FR. *Merchandises de Japon*.) articles of every description, such as tea-trays, clock-dials, candlesticks, snuff-boxes, &c. covered with coats of japan, whether plain, or embellished with painting, or gilding. Birmingham is the grand staple of this manufacture, which is carried on in the town and its vicinity to an astonishing extent. Many ingenious artists are here employed in painting designs for the centres of tea-trays, &c. and

numbers of women and children are engaged in making the numerals upon clock-dials, and in the various inferior branches of the manufacture. Vast quantities of japanned wares are annually exported from Birmingham to all parts of the habitable globe (some parts of Asia excepted,) and very high prices are frequently given for articles of this description, more especially for such as are made from *papier maché*. No inconsiderable quantity of the smaller articles are also now japanned in the metropolis. At Pontypool, in Monmouthshire, there is a manufactory of a peculiar species of japanned wares, which bears the name of that town: it is extremely beautiful, but very little of it is exported, and the manufacture of the article there is said to be on the decline. At Bilston, in Staffordshire, the coarser kinds of japanned wares are made in abundance; as also at other places in the neighbourhood.

JAR, an earthen pot or vessel of oil, containing 20 gallons.

JASPER. (GER. *Jaspiss*. DU. DA. SW. and LAT. *Jaspis*. FR. *Jaspe*. IT. *Diaspro*. SP. and PORT. *Jaspe*. RUS. *Jaschma*. POL. *Jaspid*, *Kamien*.) This stone, which is usually found in the East Indies, Egypt, Tartary, and China, is an ingredient in the composition of many mountains. It occurs usually in large amorphous masses, sometimes in round or angular pieces; its fracture is conchoidal; specific gravity from 2.3 to 2.7. Its colours are various; when heated it does not decrepitate: it is usually divided into four sub-species.

1. *Egyptian pebble*.—This variety is found chiefly in Egypt; it usually has a spheroidal or flat-rounded figure, and enveloped in a coarse rough crust; specific gravity 2.564 to 2.6. It is chiefly distinguished by the variety of colours which always exist in the same specimen, in regular stripes or layers. These colours are different browns and yellows, greens, &c.

2. *Striped jasper*.—This variety is also distinguished by regular stripes or layers of different colours: these colours are yellow, brownish-red, and green. It is distinguished from the last variety by its occurring in large amorphous masses, and by the disposition of its stripes.

3. *Porcelain jasper*.—So called because its fracture presents the appearance of porcelain. Its colours are various shades of grey, yellow, red, brown, green, mixed together. Found in mass, and in rounded pieces. Greasy. Fracture imperfectly conchoidal: opaque: brittle. It is found in the neighbourhood of pseudo volcanoes, supposed to have been altered by the action of fire.

4. *Common jasper*.—Its colours are different shades of white, yellow, red, brown, and green; often variegated, spotted, or veined, with several colours.

The above are the species of jasper, com-

monly known to exist in various parts of the world; but M. Daubenton, an ingenious French naturalist, mentions no less than 15 varieties of this precious stone, an enumeration of which we shall extract from his work.

" 1. The green jasper, brought from Bohemia, Silesia, Siberia, and the shores of the Caspian sea. 2. The red, or *diaspro rosso* of the Italians, which is neither so common, nor in such great masses as the green. 3. The yellow, from Freyberg and Rochlitz: it is sometimes of a lemon colour, and looks as if composed of silky filaments; this is called the *silk jasper*. 4. Brown, from Dalecarlia, in Finland and Sweden. 5. Violet, from Siberia. 6. Black, from Sweden, Saxony, and Finland; this is the *paragone antico* of the Italians. 7. Blueish-grey, which is very rare. 8. Milky white, of which Pliny speaks; it is found in Dalecarlia. 9. Variegated with green, red, and yellow clouds. 10. Blood-stone, which is green with red specks, brought from Egypt, and was supposed to stop the blood. 11. Veined, with various colours; when these veins have the resemblance of letters, the stone is then called *jaspé grammatique* by the French; some of this kind are found near Rochelle, in France. 12. That which has various coloured zones. 13. That called *fiorto* by the Italians, which has its various colours blended promiscuously. 14. When the jasper has a great number of colours together, it is then called *universal*. 15. When the jasper is found to contain some portions of agate, it is then called *agatized jasper*."

Jasper is mostly employed by jewellers in the formation of seals, and when well polished is esteemed a very beautiful stone.

Green jasper put into the fire loses all its greenness, and becomes of a fine pale grey.

JAZEL, a precious stone of a fine blue colour, found in different parts of the East Indies.

ICELAND AGATE, a precious stone met with in the islands of Iceland and Ascension, employed by the jewellers as an agate, though too soft for the purpose. It is supposed to be a volcanic product, being solid, black, and of a glassy texture; when held between the eye and the light, it is semi-transparent, and greenish, like the glass bottles which contain much iron. In the islands which produce it, such large pieces are met with that they cannot be equalled in any glass-house.

ICELAND MOSS, (GER. *Isländischer mos*. DU. *Yslandsch mos*. DA. *Islands mos*, *Fjællegræs*. SW. *Hedemossa*. FR. *Lichen ou mousse d'Islande*. IT. *Muschio islandico*. SP. *Musgo de islandia*. PORT. *Lichen islandico*. LAT. *Lichen islandicus*.) a species of lichen or liver-wort, which grows on many mountains both of the highlands, and lowlands, of Scotland; it consists nearly of erect leaves about two inches high, of a stiff substance when dry, but soft and pliant

when moist, variously divided without order into broad distant segments, bifid or trifid at the extremities; the upper or interior surface of the leaves is concave, chesnut colour, smooth and shining, but red at the base; the under or exterior surface is smooth and whitish, a little pitted, and sprinkled with very minute black warts; the margins of the leaves, and all the segments from bottom to top, are ciliated with small, short, stiff, hair-like spinules, of a dark chesnut colour, turning towards the upper side; the shields are rarely produced. Made in broth, gruel, or jelly, it is said to be very serviceable in coughs and consumptions, and, according to Haller and Scopoli, is much used in these complaints at Vienna. No inconsiderable quantities have of late been imported from the Northern countries, especially Norway, into Great Britain, where also it is becoming a fashionable medicine.

ICELAND SPAR, a substance which has greatly engaged the attention of philosophers under this name, or that of Iceland crystal; Bertholin, Huygens, Newton, Beccaria, and others of later date, have made experiments on its remarkable property of separating the rays of light in such a manner as to exhibit two images of an object seen through it.

ICHTHYOCOLLA, ISINGLASS.

See HUSO, and ISINGLASS.

JENNET, a name given to a fine species of Spanish horses, as also the Barbary horse. The jennet is principally valued for its fine figure.

JEER, or JEER-ROPE, in a ship, is a large rope reeved through double or treble blocks, lashed at the mast-head, and on the yard, in order to hoist or lower the yards.

JERQUER, or JERKER, an officer of the customs, whose duty it is to visit vessels in port, for the purpose of discovering whether they have any unentered goods on board. This proceeding is called *jerquing* the ship; and when the jerquer certifies that the goods found on board are conformable to the manifest, the vessel is said to be *jerqued*.

JERSEY. The finest wool, separated from the coarse by an instrument, called a Jersey comb. The Flemings first introduced the manufacture into England, and denominated it *Ostades*, of which probably our *worsted* is merely a corruption. The French call it *Estame*.

JESUITS' BARK. See BARK, Peruvian.

JET. (GER. DA. SW. and RUS. *Gagat*. DU. *Git*, *Zwarte barnsteen*. FR. *Jais*, *Jayet*. IT. *Gagata*, *Lustrino*. SP. *Axabache*. PORT. *Azeriche*. POL. *Gagatek*. LAT. *Gagus*, *Gagates*.) This substance is found in France, Spain, Germany, Britain, and other countries. It is found in detached kidney-formed masses, of various sizes, from an inch to seven or eight feet in length. The

colour is full black; internal, glossy, opaque: not so brittle as asphaltum: texture striated: fracture conchoidal. Specific gravity 1.259. It has no smell except when heated, and then it resembles asphaltum in its odour. It melts in a strong heat, burns with a greenish flame, and leaves an earthy residuum. Becomes electric by friction; and when distilled, it yields a peculiar acid. This fossil admits of a high polish, and is chiefly converted into small boxes, bracelets, buttons, and other toys. Combined with oils, it forms an ingredient in varnishes; and when mixed with pulverized lime, it is said to produce a hard and durable cement.

JETSON, JETSEN, or JETSAM, in law, is used for any thing thrown out of a ship or vessel that is in danger of being a wreck, and which is driven by the waves on shore. See **FLOTSAM**.

JEWELS, (GER. and DU. *Juwelen*. DA. and SW. *Juveler*. FR. *Pierreries*, *Joyaux*. IT. *Gioje*. SP. *Jovas*, *Pedreria*. PORT. *Joias*, *Pedreria*. RUS. *Almasü*. POL. *Drogi kamienie*, *Kleinoty*.) include all kinds of precious stones, as diamonds, rubies, &c. used as ornaments of dress.

JEWELLER, it is scarcely necessary to say, is a person dealing in jewels.

A jeweller should be a good judge of the quality and value of all kinds of precious stones. Those of this business send rough diamonds to be cut and polished to the diamond-cutter, and all other stones for the same purpose to the lapidary, and afterwards send them to be set to the working jewellers.

JEWS'-EARS, (GER. *Judasohren*, *Flieberschwämme*. DU. *Judasoren*. DA. *Hyl-desvamp*, *Judaöere*. SW. *Judöron*. FR. *Oreilles de Judas*. IT. *Orecchi di Guida*. SP. *Orejas de Judas*. PORT. *Orelhas de Judas*. LAT. *Auriculæ Judæ*, *Spongia sambusci*.) so called from its resemblance to the human ear, is a fungus, tough and thin; naturally, while growing, of a rumpled figure, like a flat and variously hollowed cup; from an inch to two inches in length, and about two-thirds of its length in breadth. A decoction of this fungus in milk is used as a gargle in some cases of quinsy.

JEWS'-PITCH, (GER. *Judenpech*. DU. *Jodenlym*. DA. *Jödeberg*, *Jodelüm*. SW. *Judebeck*. FR. *Asphalte*, *Bitume de Judée*, *Poir joive*. IT. *Asfalte*, *Bitume guidaico*. SP. *Asfalto*, *Betun Judaico*. PORT. *Asphalto*, *Betume Judaico*. RUS. *Asfalt*, *Jidowskaia smola*. POL. *Kły ziemsky*. LAT. *Asphaltum*, *Bitumen Judaicum*.) See **AS-PHALTUM**.

IGNATIUS's or JESUITS' BEANS, (GER. *Ignatius Bohnen*. DU. *Ignatius boonen*. DA. *Ignatius bönnner*. SW. *Ignatius bönor*. FR. *Fèves de St. Ignace*. IT. *Fève de S. Ignacio*. SP. *Habas de S. Ignacio*. PORT. *Favas de S. Ignacio*. LAT. *Ignatii fabæ*.) a small solid fruit which grows upon a tree in some of the Philippine islands, and

is eagerly bought up by the Chinese. The figure of this fruit is irregular; it is about the size of a green almond, when wrapped up in all its coats; its outward colour is grey; the inside of the bean resembles a brown jelly, but its consistency is almost as hard as that of horn, on which account it is usually grated; its taste is bitterish, and it commonly weighs a little above a drachm. These beans have been used as a medicine in ague, epilepsy, &c.; but they must be given with the utmost caution.

JIB, the foremost sail of a ship, being a large stay-sail extended from the outer end of the bowsprit prolonged by the jib-boom, towards the fore-top-mast-head. See **SAIL**.

JIB-BOOM, a boom run out from the extremity of the bowsprit, parallel to its length, and serving to extend the bottom of the jib, and the stay of the fore-top-gallant-mast.

IMBEZZLE, signifies to steal, pilfer, or purloin, and also to waste or diminish goods, &c. entrusted to a person's charge or care.

To such an extent had imbezzlement by agents and servants of different denominations arrived, that the detection and punishment of the offence makes now a principal title in our criminal law. See *ante*, title **EMBEZZLEMENT**.

IMPORTATION, the act of bringing goods into a country from foreign parts. But the mere coming into a port, without intention to break bulk, or unlade, is not an importation, so as to make duties of customs due, nor to subject ship or cargo to forfeiture. *Reeves*, 200. *2 Chalmers*, 280. It has generally been considered, that for any country to carry on a profitable trade, it is necessary that the value of the goods sent out of it should be greater than that of the articles imported: this, however, is a very erroneous axiom, unless it be understood with great limitations. All articles of merchandise, imported merely for re-exportation, and also such as are used or worked up in our own manufactures, are far from being hurtful to our commerce; and may even, in many respects, be deemed of equal profit with our own native commodities; it is therefore an excess of such importations alone, as are either for luxury, necessity, or for both, which is disadvantageous to the country; and not such importations as, like many of ours, consisting of raw silk, Spanish wool, cotton wool and yarn, mohair, flax, and hemp, iron, oils, pot-ashes, dyeing stuffs, naval stores, &c. either used in our ship-building, or worked up in our manufactures, a principal part of which are for exportation: neither can our importations of East India goods and colonial produce, which are chiefly designed to be afterwards exported, be deemed unprofitable, but are, on the contrary, some of the most lucrative branches of our foreign trade.

The following statement of the total value of the imports of England, in the year

1354, furnishes a curious comparison with their present magnitude, viz.	£.	s.	d.
1831 fine cloths, at 6 <i>l</i> . pr. cloth	10,986	0	0
3973 $\frac{3}{4}$ cwt. of wax, at 40 <i>s</i> . per cwt. with the customs	815	7	5
1829 $\frac{1}{2}$ tons of wine, at 40 <i>s</i> . per ton, which with do. come to	3,841	19	0
Linen cloth, mercery, grocery, and all other wares	22,945	6	10
On these last articles the customs were	285	18	3

Total - £38,872 11 6

At this period, and for a long time after, foreigners were the principal importers of goods into this country; and as it was thought that many of them, after disposing of their merchandise here, returned with the value in money to their own country, which was deemed a serious injury, many laws were made against carrying out of the realm any gold or silver, either in coin, plate, or bullion; and merchant strangers were compelled to give security that they would lay out all the money they received for the wares they imported, in English merchandise to be exported. These injudicious restrictions have been long since done away; and, excepting the prohibition of some foreign manufactures, the import of this country is probably as free, as the regulations necessary to secure the payment of heavy duties on almost every article of trade, will admit.

During the 12 years which comprised the reign of Geo. I. the whole produce of the duties of customs was 21,632,985*l*. The produce of the single year ending Jan. 5, 1816, was 10,487,522*l*. This, too, it must be recollected, was immediately after the conclusion of a war of 25 years' duration, during the greatest part of which we had little connection with the continent of Europe. The imports for the year ending Jan 5, 1821, were value 31,517,891*l*. and the duties of customs in the same year were 10,547,579.

IMPORTATION, Laws of. These laws, comprehending that immense mass of provisions, by which the shipping and trade of Great Britain, and its dependencies, are protected, are too numerous, even to be referred to more than once individually in this work; we must therefore, for particular information on the subject, point the reader's attention to *title SHIPPING AND TRADE*, in this place only observing in general terms the few following rules.

Goods imported or conveyed away without entry or payment, or security given for the duties, are to be seized.

After a ship is cleared inwards, and the watchmen or tidesmen discharged from their attendance, and any goods are found concealed which have not paid the import duties, the master or other person taking charge of such vessel, shall forfeit 100*l*.

Porters, cammen, watermen, &c. assisting in carrying on board, or landing uncustomed or prohibited goods, shall be committed for the first offence until they find surety for their good behaviour, and for the second, be committed for two months, with a penalty of 5*l*.

Merchants trading to the ports of London, may load, and unload, their goods at any of the lawful quays; between the Tower and London-Bridge, between sun-rising and sun-setting, from the 10th of September to the 10th of March; and between six in the morning and six in the evening, from the 10th of March to the 10th of September, giving notice thereof to the respective officer appointed to attend the lading and un-lading of goods, who shall, upon refusal for such attendance, forfeit 5*l*. for every default.

All foreign goods permitted to be landed by bills of sight, bills of sufferance, or bills of view, shall be landed at the most convenient quays and wharfs, as the officers of the customs shall direct; and there or at the King's storehouse of the respective ports, shall be measured, weighed, numbered, &c. by the officers appointed, who shall perfect the entry, and thereunto subscribe their names, and the next day make their report to the customer, collector, or comptroller, under penalty of 100*l*.

Produce of the British plantations must be imported directly to some port of Great Britain or Ireland.

No ship arriving from beyond sea shall be above three days sailing from Gravesend to the place of discharge in the river Thames, unless prevented by a contrary wind, or any other just impediment; nor shall any ship, bound to the port of London, touch or stay at any place adjoining to any shore between Gravesend and Chester quay; and true entries shall be made of all such ship's lading, upon oath of the master or purser of that voyage; and shall also specify the place where she took in her lading, of what country built, how manned, who was master, and who the owners; and all vessels belonging to the out-ports, shall come directly to the port of unloading, under penalty of 100*l*.

IMPOST, signifies the tax received by the prince, for such merchandise as is brought into any haven within his dominions from foreign nations. It may be distinguished from *custom*, because *custom* is rather that profit the prince makes of wares shipped outwards; yet they are usually confounded.

IMPRESSING Men. By stat. 2 & 3 Phil. & Mar. c. 16. if any waterman, who uses the river Thames, shall hide himself during the execution of any commission for pressing for his majesty's service, he is liable to heavy penalties.

By stat. 5 Eliz. c. 6. no fisherman shall

be taken by the queen's commission to serve as a mariner, but the commission shall be first brought to two justices of the peace, inhabiting near the sea-coast, where the mariners are to be taken, to the intent that the justice may choose out and return such a number of able-bodied men as in the commission are contained to serve her majesty. And by stat. 7 & 8 W. c. 21. 2 Anne, c. 6. 4 & 5 Anne, c. 19. 13 Geo. 2. c. 17. especial protections are allowed to seamen in particular circumstances, to prevent them from being impressed. All of which certainly imply a power of impressing to reside somewhere; and if any where, it must, from the spirit of our constitution, as well as from the frequent mention of the king's commission, reside in the crown alone. 1 Black. 419.

IMPREST. A word which it should seem has outgrown, as it were, its original meaning. It is now used colloquially, as well as technically in public offices, for an authority from public boards to certain officers to advance money on account; but it probably at first stood for that seal, or other mark, which was *impressed* by the examiners or commissioners of public accounts on them, as vouchers of their correctness, and of their having passed examination.

INCENSE, or FRANKINCENSE. See FRANKINCENSE.

INCH, a well-known long measure, being the twelfth part of a foot, and equal to three barley-corns in length.

INCH OF CANDLE, Sale by. In this mode of selling, a small piece of wax-candle, about *an inch* long, is kept burning, and the last bidder, when the candle goes out, is entitled to the lot or parcel exposed to sale.

If any difference arise in adjusting a lot, when several bid together, the lot is again put up, and the last bidder is bound to stand to his bargain, and take the lot with all its imperfections.

In these cases, the goods are set up at a certain price, and no person shall bid less than a sum specified, more than the last bidder.

INCLE. See **INKLE.**

INDEMNITY, is where one person secures another from responsibility against any particular event; thus, a policy of insurance is a contract of indemnity against any particular loss.

Where one person also becomes bail for another, a bond of indemnity is frequently executed; and where a bond or bill of exchange has been lost or mislaid, the acceptor or obligee would not act prudently in paying it, without being secured by a bond of indemnity.

As circumstances occur daily in trade, which may render an indemnity necessary, the following are forms which are in general use.

The Condition of a Bond of Indemnity on paying a lost Bond.

Whereas the above-named B. B. by his bond or obligation, duly sealed and delivered, and bearing date on or about the — day of —, became bound to the above-bounden A. A. in the penal sum of —£. conditioned for the payment of the sum of —£. unto the said B. B. his executors, administrators, or assigns, at the end of — months next after the date thereof, as in and by the said bond, when produced, will more fully appear. And whereas the said bond is alleged to be lost, or so mislaid that the same cannot be found. And whereas the said B. B. the day of the date hereof, at the request of the said A. A. and on his promise of indemnity, have made him full satisfaction of and for the said bond. Now the condition of this obligation is such, that if the above-bounden A. A. his heirs, executors, or administrators, or any or either of them, do and shall, in case the said bond or obligation shall happen to be found, or come to his, their, or any of their hands, custody, or power, or of the hands, custody, or power of any other person for them, deliver, or cause the same to be delivered, unto the —, in order to be made void, cancelled, and destroyed; and also shall and do, from time to time, and at all times hereafter, save, keep harmless, and indemnified, the said master, wardens, and society, and their successors, of and from all actions, suits, troubles, costs, charges, damages, and expenses whatsoever, which shall or may at any time hereafter happen or come to them, for or by reason of the said bond or obligation, or any of the money thereby paid, or for, touching, and concerning the same, then this, &c.

Condition of a Bond of Indemnity upon paying a lost Bill.

Know all men, &c. (See **BOND.**)

Whereas the above named A. B. in the name of himself and C. D. his partner, gave a bill or note under his hand, dated, &c. for the sum of —£. payable to E. F. which said bill or note was delivered to the above-bound G. H. and I. K. but is since lost or mislaid. And whereas the said A. B. hath, at or before the sealing and delivery hereof, paid unto the said G. H. and I. K. the said sum of —£. due and payable on the said bill, notwithstanding the said bill or note cannot be found to be delivered up, the receipt of which said sum the said G. H. and I. K. do hereby acknowledge; and of and from the same and every part thereof, do acquit and discharge the said A. B. and C. D. their executors and administrators for ever, by these presents. Now the condition, &c. that if the said G. H. and I. K. their heirs, executors, and administrators, do and shall deliver up the said note, when it shall be found, to be cancelled, and until the same shall be so delivered up and cancelled, *s ve,*

and keep harmless and indemnified, the said A. B. and C. D. their heirs, executors, and administrators, and their and every of their lands, tenements, goods, and chattels, of and from the said bill and note, and the sum of —*l.* therein mentioned, and of and from all actions, suits, costs, charges, payments, and damage, whatsoever, which shall or may be brought, commenced, sued, prosecuted, recovered, or awarded against them, or any or either of them; or which they, either, or any of them, may sustain or be put unto, by any person or persons whatsoever, for, upon, or concerning the said bill or note, and the said sum of —*l.* therein mentioned, and which is so paid to the said G. H. and I. K. as aforesaid. Then the said obligation to be void, otherwise to be, and remain, in full force virtue, and effect.

Sealed and delivered, being }
first duly stamped, in the presence of ———— }

INDIAN-BERRY, (*Indian berries*. GER. *Fischkörner*, *Follkörner*. DU. *Kokeltjes*. DA. *Köckekjerner*. SW. *Fiskkärnor*. FR. *Coques de Levant*. IT. *Coccole di Levante*. SP. and PORT. *Cocas de Levante*. LAT. *Cocci Indici*, *Cocculus Indicus*.) the name of a poisonous berry, too frequently mixed with malt liquors, in order to make them intoxicating; but this practice is expressly forbidden by act of parliament. It is the fruit of the *menispermum cocculus*. Fishermen have a way of mixing it with paste; this the fish swallow greedily, and are thereby rendered lifeless for a time, and float on the water. We have it from Malabar, and other parts of the East Indies.

INDIAN ARROW-ROOT, *Maranta Arundinacea*. It has a stalk and leaf exactly like the plant called Indian Shot; but the flower differs; that of the latter being a beautiful scarlet, and that of the former milk-white. The leaves fall in December, and the root is fit to dig up in January. It is mealy, but may be kept perfectly sound for many years, as no insect will meddle with it. It is the root of the tree from which the Indians in South America used to make their arrows. It is indigenous in South America, has been introduced abundantly into all the West India islands, and is not uncommon now in the hot-houses of England.

INDIAN-CORN. (GER. *Türkischer weigen*, *Maïs*. DU. *Spaansche tarro*, *Turksch koorn*, *Indiaansch koorn*, *Mays*. DA. *Tyrkisk korn*. SW. *Tyrkiskt hvete*. FR. *Maïs*, *Bled de Turquie*, *d'Espagne*, *d'Inde*, *de Guinée*. IT. *Gran Turco*, *Formento Turco*, *Grano d'India*. PORT. *Mair*, *Milho de Turquia*. RUS. *Turezkoj chlyeb*. POL. *Zyto turreckie albo Indyyskie*. LAT. *Fruentum Indicum*.) See MAIZE, and ZEA.

INDIAN-INK. (GER. *Tusch*. DU. *Oostindische inkt*. DA. *Tusk*. SW. *Tusch*. FR. *Encre de la Chine*. IT. *Inchiostro della*

China. SP. *Tinta de la China*. PORT. *Tinta da China S. de Nankin*. RUS. *Tschernilii*, *Kitaishia*, *Tusch*. POL. *Czernidlo Indyyskie*, *Tusa*. LAT. *Atramentum Indicum*. S. *Chinense*.) This valuable black, for water-colours, is brought to us from China and the East Indies, in small quadrangular cakes, generally marked with Chinese characters. By dipping the end of one of the cakes in a little water, and rubbing it about on the bottom or sides of the vessel, a part of its substance is taken up by the water, which may thus be readily tinged to any shade of black or grey, from such as shall just colour paper, to a fine full black.

It is ascertained, as well from experiment as from information, that Indian ink is made of lamp-black and size, or animal glue, with perfumes. The fine soot from the flame of a lamp or candle, mixed with clean size, will make an ink equal to that imported.

INDIAN-LEAF, (GER. *Indianisches Blatt*. DU. *Indiaansch blad*. DA. *Indianskt blad*. SW. *Indianiskt blad*. FR. *Feuille d'Inde*, *Malabatre*. IT. *Foglio Indo*. SP. *Folio Indico*, *Hoja Indica*. PORT. *Folha da India*. LAT. *Folium Indicum*, *Malabathrum*.) a large leaf of a dusky-green, or somewhat brownish colour, the produce of a tree which is large and lofty, and in its flowers and fruit resembles the cinnamon-tree. This tree is common in Malabar. Indian leaf has an aromatic smell, somewhat resembling that of a mixture of cloves and cinnamon; its taste is rather acrid and bitter, but very aromatic. It is used in pharmacy, being an ingredient in the *theriaca mithridate*, and some other compositions.

INDIAN-RUBBER. (GER. *Federharz*. DA. *Veérkragtig hars*. DU. *Fiergummi*, *Elastisk gummi*. SW. *Elastisk Kæda*. FR. *Caoutchouc*, *Résine élastique*. IT. *Gomma o Resina elastica*. SP. *Resina elastica*, *Ule*, *Ulce*. PORT. *Boracha*, *Resina do Para*, *Resina elastica das borachinhas*. LAT. *Gummi elasticum*.) See GUM, Elastic.

INDIAN SAFFRON. See TURMERIC.

INDIGO, (GER. DU. DA. SW. and FR. *Indigo*. IT. *Induco*. SP. and PORT. *Anil*. RUS. *Krutick*, *Bruskowaja*, *Kraska*, *Indigo*. POL. *Indych*. LAT. *Indigo*.) *Indigofera*, is the indigo plant, and of this there are 35 species, the most remarkable of which is the *tinctoria*, now a native of the warm parts of Asia, Africa, and America, but originally of Asia only, whence the Dutch alone imported it, till about the commencement of the 17th century, when their exorbitant extortions occasioned its being transplanted to other hot climates. Indigo, as well as woad and madder, are the objects of protection of an early stat. of Car. I. This plant requires a rich soil, well tilled, and not too dry; the seed of it, which, as to figure and colour, resembles gunpowder, is sown in little furrows that are about the breadth of the hoe,

two or three inches deep, at a foot distance from each other, and in as straight a line as possible. Continual attention is required to pluck up the weeds, which would soon choke the plant. Though it may be sown in all seasons, the spring is commonly preferred. Moisture causes this plant to shoot above the surface in three or four days; it is ripe at the end of two months. When it begins to flower, it is cut with pruning-knives; and cut again at the end of every six weeks, if the weather is a little rainy. It lasts about two years, after which term it degenerates; it is then plucked up, and fresh ones planted. As it soon exhausts the soil, because it does not absorb a sufficient quantity of air and dew to moisten the earth, it is of advantage to the planter to have a vast space which may remain covered with trees, till it becomes necessary to fell them in order to make room for the indigo. The valuable dye-stuff, called indigo, bears some faint resemblance to starch; but its properties are sufficiently peculiar to distinguish it from all other substances, and its importance entitles it to a distinguished place among vegetable productions.

The method of making indigo.—When the plant has been cut down, it is placed in layers in a large wooden vessel, and covered with water. In this situation it cannot remain long in warm climates without undergoing some change. Putrefaction, accordingly, very soon commences, or rather a kind of fermentation, which goes on best at the temperature of 80°. The water soon becomes opaque, and assumes a green colour; a smell resembling that of volatile alkali is exhaled, and bubbles of carbonic acid are emitted. When the fermentation has continued long enough, which is judged of by the paleness of the leaves, and which requires from six, to twenty-four, hours, according to the temperature of the air, and the state of the plant, the liquid is decanted off the plants into large flat vessels, where it is constantly agitated till blue flocculi begin to make their appearance; fresh water is now poured in, which causes the blue flakes to precipitate. The yellow liquid is decanted off, and the blue sediment poured into linen bags. When the water is drained from it sufficiently, it is formed into small lumps, and dried in the shade. In that state it is imported into Europe, and sold under the name of indigo.—A bastard sort of indigo may be obtained from the *isatis tinctoria* or woad; and from other plants, commonly enough cultivated, and even found wild, in England. When arrived at maturity, woad is cut down, washed, dried hastily in the sun, ground in a mill, placed in heaps, and allowed to ferment for a fortnight. It is then mixed, and made up into balls, which are piled upon each other, and exposed to the wind and sun. In this state they become hot, and exhale a putrid, ammoniacal smell.

The fermentation is promoted, if necessary, by sprinkling the balls with water. When it has continued for a sufficient time, it is allowed to fall to a coarse powder; in which state it is sold as indigo.

Genuine indigo is a fine light friable substance, of a deep blue colour; its texture is very compact, and the shade of its surface varies according to the manner in which it has been prepared. The principal tints are copper, violet, and blue; the lightest indigo is the best, but it is always more or less mixed with foreign substances, partly owing, doubtless, to the carelessness of the preparation, and partly to the bodies which the plant containing indigo yields to water. From the analyses of Bergman, to whom we are indebted for one of the most complete treatises on the properties of indigo which has yet appeared, the purest indigo which he could procure was composed of the following constituents:

47 pure indigo.	The earth consisted of
12 gum	10.2 barytes
6 resin	10.0 lime
22 earth	1.8 silica
13 oxide of iron	
	22.0
100	

But in all probability the earth differs in different specimens; for Proust found magnesia in considerable quantity in the specimens which he examined.

Berthollet speaks of the indigo from Guatemala as the best of any; it is so light as to swim on the surface of the water, instead of sinking to the bottom, as all the other kinds do. Carolina indigo is usually of very inferior quality; the Jamaica indigo is still worse. The different qualities of South American indigo are expressed by the three terms, *Flora*, *Sobres*, and *Cortes*, whereof the first is the best, and the last the worst. The indigo brought from South America is imported in *serons*, or small bags made of buffalo-hides; that of North America in casks and boxes. Many species of the *indigofera* have been discovered at the Cape of Good Hope.

INDORSEMENT, is a term usually applied to the holder of a negotiable instrument, characterising that act by which he transfers or assigns his interest in the same to some third person, by indorsing or signing his name on the back of the instrument.

Indorsements are either *in blank* or *in full*; in the former, the party signs his name only; in the latter, some particular person is mentioned; they may also be either *general* or *restrictive*; a general indorsement is synonymous with an indorsement in blank; a restrictive indorsement is to some particular person, or upon some certain condition.

The indorsement is considered in law as constituting a new instrument; and an addi-

lional security; as the indorser guarantees the payment of the bill, and stands responsible for the acceptor and all antecedent indorsers. *See* **BILLS OF EXCHANGE.**

INFERNAL STONE, (GER. *Höllenstein*. DU. *Helsche steen*. DA. *Sølvsteen*, *Blaasteen*, *Helvedes Steen*. SW. *Silfver*, *Frätsten*. FR. *Pierre infernale*. SR. *Piedra infernal*. PORT. *Pedra infernal*. RUS. *Adz-kii*, *Kamen*. POL. *Kamich piekielny*. LAT. *Lapis infernalis*.) in pharmacy, is prepared from an evaporated solution of nitrate of silver, commonly known by the name of lunar caustic.

INGOT, a mass of gold or silver from the mines, melted and cast into a sort of mould, but neither coined nor wrought. *See* **BULLION.**

INGROSSER. *See* **FORESTAL-LING.**

INK. (*Writing-ink*. GER. *Dinte*. DU. *Ink*, *Inkt*. DA. *Blek*. SW. *Blåk*. FR. *Encre*. IT. *Inchiostro*. SP. *Tinta*. PORT. *Tinta de escrever*. RUS. *Tschernilo*. POL. *Atrament*, *Inkaust*. LAT. *Atramentum*.) There are two principal kinds of ink, writing and printing ink.

Black writing-ink.—Take eight ounces of Aleppo galls, in coarse powder; four ounces of logwood, in thin chips; four ounces of green copperas; three ounces of gum-arabic, in powder; one ounce of blue vitriol; and one ounce of sugar-candy. Boil the galls and logwood together in twelve pounds of water for one hour, or till half the liquid has been evaporated. Strain the decoction through a hair-sieve, or linen-cloth, and then add the other ingredients. Stir the mixture till the whole is dissolved, more especially the gum; after which leave it to subside for twenty-four hours. Then preserve it in bottles of glass or stone-ware corked closely, and laid by for use. For another species of ink, *see* title **PRIVET.**

Red ink.—Take of the raspings of Brazil-wood a quarter of a pound, and infuse them two or three days in vinegar. Boil the infusion for an hour over a gentle fire, and afterwards filter it while hot. Put it again over the fire, and dissolve in it, first, half an ounce of gum-arabic; and afterwards of alum and white sugar, each half an ounce.

Printing-ink is a black paint, composed of lamp-black and linseed, or other oil, boiled, so as to acquire considerable consistence and tenacity. The obtaining good lamp-black appears to be the chief difficulty in making it. The ink used by copper-plate printers differs from the last only in the oil not being so much boiled, and the black which is used being Frankfort-black. *See* title **PRINTING.**

Sympathetic inks are such as do not appear after they are written with, but which may be made to appear at pleasure, by certain means to be used for that purpose. A va-

riety of substances have been recommended. The most common are these:

1. Dissolve some sugar of lead in water, and write with the solution. When dry, no writing will be visible. When you want to make it appear, wet the paper with a solution of alkaline sulphuret, (liver of sulphur,) and the letters will immediately appear of a brown colour. Even exposing the writing to the vapour of this solution will render it apparent.

2. Write with an infusion of galls, and when you wish the writing to appear, dip it into a solution of green vitriol; the letters will appear black.

3. Write with diluted sulphuric acid, and nothing will be visible. To render it so, hold it to the fire, and the letters will instantly appear black.

4. Milk, the juice of lemons, or onions, a solution of sal ammoniac, green vitriol, &c. will answer the same purpose, though not so easily, nor with so little heat.

5. Green sympathetic ink. Dissolve cobalt in nitro-muriatic acid, and write with the solution. The letters will be invisible till held to the fire, when they will appear green, and will disappear completely again when removed into the cold. In this manner they may be made to appear, and disappear, at pleasure; and a very pleasant experiment of this kind is to make a drawing representing a winter scene, in which the trees appear void of leaves, and to put the leaves on with this sympathetic ink; then, upon holding the drawing near to the fire, the leaves will begin to appear in all the verdure of spring. *See* title **COBALT.**

INK, Indian. *See* **INDIAN INK.**

INK, removing stains of. The stains of ink on cloth, paper, or wood, may be removed by almost all acids; but those acids are to be preferred which are least likely to injure the texture of the stained substance. The muriatic acid, diluted with five or six times its weight of water, may be applied to the spot, and, after a minute or two, may be washed off, repeating the application as often as may be found necessary. But the vegetable acids are attended with less risk, and are equally effectual. A solution of the oxalic, citric, (acid of lemons,) or tartareous acids, in water, may be applied to the most delicate fabrics without any danger of injuring them; and the same solutions will discharge writing, but not printing. Hence they may be employed in cleaning books which have been defaced by writing on the margin, without impairing the text. Lemon-juice, and the juice of sorrel, will also remove ink-stains, but not so easily as the concrete acid of lemons, or citric acid.

INKLE, a sort of broad linen tape, principally manufactured at Manchester and some other towns in Lancashire.

INLAID-WORK. *See* **MARQUETRY.**

INLAND BILLS, bills of exchange made payable in the same country in which they are drawn. *See* **BILLS OF EXCHANGE**.

INSOLVENT. A tradesman, who has not a capital adequate to the payment of his debts, is said to be insolvent. By 1 Geo. 4. c. 119, amended by 3 Geo. 4. c. 123, a court of three commissioners, barristers of ten years standing, is established. It is styled, *The Court for Relief of Insolvent Debtors*. The court may remand insolvents for spaces of time, of which none exceed three years. If insolvents are imprisoned in the country, the final hearing is before the magistrates, at general quarter sessions, or an adjournment thereof.

INSTALMENT, is where a sum of money due is, by agreement between the debtor and creditor, to be paid in certain proportions, and at stipulated times.

Where a warrant of attorney, bond, or other instrument, has been given to pay by instalments, unless it is stipulated, that, upon default in payment of the first instalment that shall become due, the penalty shall attach, and the creditor shall be at liberty to proceed for the whole, he will be compelled to wait until the day after that assigned for payment of the last, before he can proceed: it is therefore the usual practice, to stipulate on any instrument for payment by instalments, that upon default of payment of the first, the creditor shall be at liberty to proceed for the whole. *See* **COMPOSITION and AGREEMENT**.

INSURANCE. Although there are many different sorts of insurance, in their principle, and objects, they are perfectly similar. The principle consists in giving a certain small sum to avoid an eventual great loss; and the sum given, which is called a premium, is in all cases proportioned to the loss against which the persons insuring are to purchase a guarantee, and the degree of probability of the event taking place.

Several insurance-offices have been established against loss by fire, losses at sea, and what are called life-insurances: the two first are perfectly simple in the abstract, however complicated in detail. The latter is liable to an infinite variety of cases, and is transacted in many different modes.

No human invention is perhaps more creditable to the wisdom of man, nor is any so conducive to the alleviation of misery, as insurances; because loss of money in the small is scarcely an evil, but in the great is sometimes productive of the most lamentable consequences.

There are a great variety of incorporated bodies or companies established for these purposes, and all of them publish their plans and conditions in a plain and fair manner. No wise man who has risks to run, should omit applying to one or other of these companies, that, whilst he is in affluence, he may secure himself against

eventual misfortune. To the credit of the understanding of the inhabitants of this country, there are few so foolish and heedless as not to take advantage of so great a benefit. *See* title **EUROPE**, article **LONDON**.

The *life-insurances* are to secure a man or his survivor, &c. &c. against want, by laying up a trifle when he can afford to do so. Nothing is more prudent for individuals, nor more advantageous for the community, than this practice: all persons who have children under age, and no property to leave them, persons enjoying annual incomes which must cease with their lives, or following professions which age or disease may render unproductive, ought to avail themselves of those advantages which insurance holds forth to persons in their predicament; but as the circumstances are almost infinite, the most eligible method is for each person to inspect the different printed proposals, and select those which are more peculiarly adapted to their case.

Insurance against fire.—A policy of insurance against fire is a contract of indemnity, by which the insurers are bound to be responsible against any loss which the insured may sustain from accidents by fire.

A premium is given as a consideration for this policy, and several companies and societies have been established in London and different parts of the country for this purpose: some of these are called contribution societies, in which the parties insured become members or proprietors, participating in profits and losses; the other companies insure houses and goods at their own risk.

The conditions of insurance are contained in the proposals, and they vary in the different offices.

The London Assurance inserts a clause, that they will not be liable for any damage by fire, occasioned by any invasion, foreign power, or any military or usurped power whatever: under this clause it has been held, that the insurers were liable to make good a loss by fire occasioned by a mob, which, under pretext of the high price of provisions, assembled riotously and burned down the plaintiff's malting-house.

The Sun fire-office, in its exempting clause, introduces civil commotions; and under this it was held, that they were exonerated from the losses occasioned by the rioters in the year 1780.

By the proposals of the Phoenix Company it is stipulated, that "persons insured shall give notice of the loss forthwith, deliver in an account, and procure a certificate of the minister and churchwardens, and some reputable householders of the parish, importing, that they knew the character "of the assured, and believed that he really sustained the loss, and without fraud." On the question whether the procuring of such certificate were a condition precedent to the

right of the assured to recover on the policy, the Court of B. R. on a writ of error from the Court of B. C. held it to be a condition precedent, and that it was immaterial that the minister, &c. wrongfully refused to sign the certificate. *Wood v. Worsley*, 2 H. B. 574. 6 T. R. 710.

The proposals of these societies comprise the terms of the contract, and the conditions upon which they agree to insure; these proposals therefore must be strictly complied with; and when any loss happens, the insured ought to give notice immediately of the loss, stating as particular an account of the value as circumstances will permit.

A policy of insurance is not in its nature assignable, nor can it be transferred, without the express consent of the office; when, however, any person dies, his interest shall remain in his executors or administrators respectively, who succeed or become entitled to the property, provided such representatives respectively procure their right to be indorsed on the policy.

The party insured, to be entitled to indemnity, must prove an interest in the property insured, at the time the fire happened. The subject of insurance may be considered under two points of view:

First, The nature and commencement of the risk.

Second, The interest of the insured.

First, The nature and commencement of the risk.—The risk commences in general from the signing of the policy, unless there be some other time specified. Policies of insurance may be annual, or for a term of years, at an annual premium; and it is usual for the office, by way of indulgence, to allow fifteen days after each year for the payment of the premium for the next year in succession, and provided the premium were paid within that time, the insured has always been considered as within the protection of the office.

In case of the burning of houses under lease, and there is an exception of damages by fire, the landlord is not obliged to rebuild, although he may have insured; and if there be an express covenant to pay the rent, the tenant is bound by law to pay the rent for the remainder of the term, although he has no premises to occupy.

If in a general covenant to repair without any exception as to fire, the tenant, in case of accidental fire, will be compelled to rebuild.

Any trustee, mortgagee, reversioner, factor, or agent, has sufficient interest in the goods under his custody, to effect a policy of insurance, provided the nature of such property be distinctly specified at the time of executing such policy.

The Union Fire-office differs from the rest in the adoption of two new terms, viz. *half-hazardous*, and *hazardous and half-hazardous*. The premium for 1000*l.* half-hazardous is 2*s.* 6*d.*—Hazardous and half-hazardous, 4*s.*—2000*l.* half-hazardous, 3*s.*—Hazardous and half-hazardous, 5*s.* 6*d.*—3000*l.* half-hazardous, 3*s.* 6*d.*—Hazardous and half-hazardous, 6*s.* 6*d.*—30,000*l.* half-hazardous, 4*s.*—Hazardous and half-hazardous, 7*s.*

WESTMINSTER.

10000	0 2 0	0 3 0	0 5 0
-------	-------	-------	-------

Exclusive of these, is the County Fire-office, Southampton-street, and several others for different counties.

Explanation of the Terms.

COMMON INSURANCE.

Buildings not hazardous.—Brick or stone buildings, with party-walls, covered with slate, tile, or metal, in which no hazardous trades are carried on, or hazardous goods deposited.

Goods not hazardous.—Wearing apparel, printed books, plate, and liquors, in private use, come under the general article *furniture*, without any particular specification. Watches,

jewels, and trinkets, in private use, must be separately described; but the premium on these does not exceed that upon goods not hazardous.

HAZARDOUS INSURANCE.

Hazardous buildings.—Timber, or plaister buildings, and buildings without party-walls of stone, or brick, in which no hazardous trades are carried on, or hazardous goods deposited.

Brick or stone buildings, in which hazardous trades are carried on.

Thatched buildings not having a chimney, and not adjoining to any building having a chimney.

Hazardous goods.—Goods not hazardous, deposited in hazardous buildings.

Stock of hazardous trades in brick or stone buildings.

Pictures, horses, harness, carriages, and fodder, in buildings not hazardous.

Ships in port, and their cargoes; ships building, or repairing; barges, and other small craft, on rivers.

DOUBLE HAZARDOUS.

Buildings.—Hazardous buildings, in which hazardous trades are carried on.

Goods.—The stock of hazardous trade in hazardous building.

Pictures, horses, carriages, and fodder in hazardous buildings.

China and glass.

Insurance upon Lives.—A policy of insurance upon lives, is, like all other policies, a contract of indemnity, whereby persons having incomes determinable upon their own lives, or the lives of others, arising from landed property, church livings, public employments, pensions, annuities, &c. by paying such annual premium as they can spare from their present necessities, may secure to their widows, children, or other dependants, an adequate sum of money, or an equivalent annuity, payable upon their deaths.

The fines to be paid on the renewal of copyhold leases, may also be provided for by these annuities: and any person having a life-income, who wants to borrow money, but who can give only his own personal security for it, may, by insuring his life, secure to the lender the repayment of such money, though he should die before he is enabled to discharge the debt.

The first life-insurance established in England was that of the Amicable Society, which was so beneficially productive, that the precedent was followed upon a more enlarged basis by the establishment of the *Royal Exchange*, and *London Insurance*, companies, which, by charter in the reign of George the First, were also enabled to make insurances upon lives.

The society for equitable insurances on lives and survivorships was founded by deed, enrolled in the court of King's Bench, in the year 1762, in which every person insured becomes a member, participating the profit and loss of the society.

Subsequent to the above, other establishments were formed upon similar principles, viz. the *Westminster Society* for insurance upon lives and survivorships, and granting annuities, and others.

This subject may be considered in three distinct points of view:

First, Warranty of health and age of the insured.

Second, The interest of the insured.

Third, The risk, its commencement, and termination.

FIRST, Warranty of health and age of the insured.—This warranty is generally inserted

in the policy, or contained in the declaration or agreement signed by the insured, that the person whose life is the object of insurance, has no disorder which tends to the shortening of life; that he has had or has not had the small-pox; and that his age does not exceed so many years; that this declaration shall be the foundation of the contract between the parties; and that if any misrepresentation or untrue averment be contained therein, the contract shall not only be void, but the premium shall be forfeited.

It is to be understood from the words in the warranty, that the insured has no disorder which tends to the shortening of life, and that he is perfectly free from the seeds of all disorder.

The warranty is sufficiently true, if the party insured, at the time of insurance, be in such a reasonable good state of health as to be insured upon common terms, for persons of his age and condition; and even if, at the time of insurance, the party insured laboured under some particular infirmity, as spitting blood, &c. if it can be proved that such particular infirmity had no tendency to shorten life; nor will the warranty be forfeited, by showing that the party was troubled with spasms and cramps, arising from violent fits of the gout.

Where there is no warranty, the insurer takes the risk upon himself, however the health of the insured may be, unless there should be some concealment or fraudulent misrepresentation.

Where the insured refuses to warrant, but the broker tells the first underwriter, that from the account he had received he believed it to be a good life, there being no fraud, the underwriter runs all risks.

Every subsequent underwriter may give in evidence any representation made to the first.

SECONDLY, The interest of the insured.—Every insurance made upon lives, in which the insurer has no interest, is void; the name of the person interested in the event shall be inserted in every policy, and the insured shall recover no more than the amount or value inserted in such policy, and his interest, as proved therein.

Every creditor has an insurable interest in the life of his debtor; but it has been determined, that the holder of a note won at play, the consideration of which is void by law, has no insurable interest in the life of the maker, and consequently such policy will be void; but the infancy of a debtor cannot be objected to a person insuring, and a trustee may insure the life of his *cestui que trust*.

THIRDLY, Of the risk, its commencement, and termination.—In insurance upon lives, as there can be no partial event, the loss must universally be total.

The following are among the exceptions annexed to the conditions of different insurance companies. In some, as in the *Royal Exchange* and *Westminster Societies*,

"Every insurance shall be void, if the party insured shall depart the limits of Europe; shall die upon the seas; or enter into any military or naval service whatever without the consent of the company; or shall die by suicide, duelling, or the hands of justice."

Where the insurance, however, is made by a person on the life of another, death by suicide, duelling, or the hands of justice is not excepted. Such too are the terms of the *Equitable Insurance and Pelican Life Insurance*, with the exception of duelling.

In all insurance upon lives, not only the cause of the loss, but the loss itself, must appear to have happened during the continuance of the risk; and, therefore, if a man's life be insured for a year, and some short time before the expiration of the term he receive a mortal wound of which he dies after the year, the insurer will not be liable; but where there is any uncertainty, whether the death happened within the time limited, this is a question of fact that must be left to the decision of a jury. 1 T. R. 260.

A creditor may insure the life of his debtor to the extent of his debt, but such a contract is substantially a contract of indemnity against the life of the debtor; and therefore if after his death his executors pay the debt to such insuring creditor, the latter cannot afterward recover upon the policy; and that although the debtor died insolvent, and the executors were furnished with means of payment by a third person. *Godsal v. Boldico*, 9 East. R. 72.

It is not to be concluded that a disorder with which a person is afflicted before he effects an insurance on his life is "a disorder tending to shorten life" within the meaning of the declaration required by the Equitable Assurance Office, from the mere circumstance that he afterwards dies of it, if it be not a disorder which generally has that tendency. *Watson v. Mainwaring*, 4 Taunt. 763.

Shipping Insurance, or insurance against losses by sea, is of very ancient date in this kingdom, being recognized by stat. 43 Eliz. c. 12. as a practice "time out of mind." In what country this practice originated, or at what period written policies were introduced, are matters of little interest but to the antiquary; however, it is highly probable that a maritime country gave birth to them, and there is reason to think that country was England, for, in 1523, in the policies of the merchants of Antwerp, there was a clause providing that "all things concerning the said assurance should be as was accustomed to be done in Lombard-street, in London." At that time Lombard-street was the emporium of wealth, as it is now, and was inhabited by the "goldsmiths," of whom the present race of bankers are the successors in calling or profession, as well as in situation.

Marine Insurance, is regarded by the law as a contract between two or more parties; that on one paying a certain premium he shall be indemnified and insured against certain risks set forth in the policy. As it was a common practice of insuring large sums on vessels, without having property on board, and which were called wager-policies of insurance, interest or no interest, and of insuring the same goods several times over, it was enacted by 10 Geo. 2. c. 37. that all insurances, interest or no interest, or without further proof of the interest than the policy, or by way of gaming, or without benefit of salvage to the insurer, should be void, except on privateers, or on ships or goods from the Spanish or Portuguese dominions, and that no re-assurance shall be legal, unless the former insurer be insolvent or dead; and that in the East India trade the lender of money on bottomry, or at respondentia, shall alone have a right to be insured for the money lent; and the borrower shall recover no more upon any insurance than the surplus of his bottomry or respondentia bond. This statute, however, does not extend to foreign ships, upon which, as before the statute, there may still be insurances, interest or no interest. These were not included in the act, on account of the difficulty of bringing witnesses from abroad to prove the interest. *Doug.* 302. But where there is an interest on board, the owner by a valued policy, in which the value of the goods is agreed upon and fixed between the parties, may insure far beyond the extent of the real value. For the excess of the insurance is held not to be within the statute, unless it should appear, that the interest is so small as to be a mere evasion of the act, and a pretence for gaming. In an open policy, where no value is fixed, the prime cost of the goods must be proved. 2 Burr. 1170.

No insurance can be made on any illegal voyage. It is generally stipulated in policies that the insurer shall not be answerable for any partial loss on certain articles; but on others less difficult to be preserved at sea, but liable to partial injuries, shall be liable for any partial loss above five per cent.; and as to all other goods and the ship and freight, he shall only be liable for such losses, above three per cent. But he is liable on all losses, however small, called general average, or losses occasioned by the ship stranding, but this loss must be an immediate, not a remote consequence of the stranding. The commencement of the risk on the ship varies in most cases, but usually continues till the ship has been twenty-four hours at safe anchor. Upon goods it commences when they are on board, and continues till they are removed or landed. The ship insured must be sound, and in every respect fit to bear the sea, and perform the voyage; and if she deviates from the usual

course, and stops at places not usually stopped at, without a proper cause, the contract is void.

The following are some of the principal cases relative to *Marine, Fire, and Life Insurances* which have been determined in our courts of law.

ABANDONMENT.

Insured must *abandon* before he can recover. *Randall v. Cockran*, 1 *Ves.* 98.

Proceedings to be adopted. *Mitchell v. Edie*, 1 *Term Rep.* 608. *Da Costa v. Newnham*, 2 *T. R.* 407.

Abandonment must be *total*, not *partial*. 2 *Burr.* 697.

Upon an embargo in a foreign port, the owner, who had separately insured *ship* and *freight*, abandoned them; after which the embargo was taken off, and the ship completed her voyage and earned her freight: held assured could not recover as for a total loss of freight, the freight having been earned. *McCarthy v. Abell*, 5 *East*, 588.

Insured cannot take chance of endeavouring first to save and make the best of their cargo on their own account, and afterwards *abandon*, when they find they cannot turn it to their advantage. *Anderson v. The Royal Exchange Assurance Company*, 7 *East*, 58.

On a wagering policy the assured cannot *abandon*. *Kemp v. Vyne*, 1 *T. R.* 504.

When the voyage is lost, but the property is saved, the owners may *abandon*. *Mitchell v. Edie*, 1 *T. R.* 608.

A foreigner insuring here his ships, or goods, on a voyage, is not entitled to *abandon* on an embargo laid on the property in the ports of his own country, as his assent is virtually implied in every act of his own government, and makes such embargo his own voluntary act. *Conway v. Grey*, 10 *E. R.* 536.

Ship wrecked, but goods landed in a damaged state, so that they become unprofitable to the assured. Underwriters on the goods, who were freed by the policy from particular average, could not be made liable as for a total loss by *abandonment*. *Thompson v. Ass. Com.* 16 *E. R.* 214.

ACTION,

Not maintainable for premiums on *Reassurance*. *Edgar and another, assignees of Carden, v. Fowler*, 5 *East*, 222.

Will lie for *not insuring*, triable on the same principles as action on policy. *Harding v. Carter and another, Sittings at Guildhall, after Easter T.* 1781.

Against insurance companies must be debt or covenant. *The Royal Exchange Assurance Company, and the London Assurance Company, erected by 6 Geo. 1. c. 18. Park*, 396. 59 *Geo. 3. c. 83, &c.*

Against a private underwriter, *indebitatus assumpsit*, and may be brought in the broker's name. 3 *Black. Com.* 157. *Park*, c. 20. See 19 *Geo. 2. c. 37. sec. 6.*

In what cases *action* for money had and

received lies. 2 *Burr. B. R.* 105. 1 *Tidd.* 557. *Park's Introd.*

Actions upon promises will lie to recover general average loss, incurred by sacrificing ship's tackle, &c. for benefit of the whole concern. *Birckley v. Presgrave*, 1 *East*, 220.

ADJUSTMENT.

What is so called. *Park*, 117, 118.

Consequence of underwriter refusing to pay after adjustment. *Thellusson v. Fletcher, Dougl.* 515. See also *tit. Loss*.

A partial loss on a policy on goods by reason of sea damage, is to be calculated by ascertaining the difference between the respective gross proceeds of the same goods when sound, and when damaged, not the net proceeds. *Harry v. Exch. Com.* 3 *Bos. and Pul.* 508.

A ship was insured, warranted free of capture in port. A letter announcing her capture stated it to be in port, on which the underwriter and insured *adjusted*; the former returning, and the latter receiving back, the premium. It afterwards appeared the capture was *not* in port. Held that the assured was not precluded by the adjustment and repayment from recovering on the policy. *Reyner v. Hall*, 4 *Taunt.* 725.

AVERAGE, general.

Goods must be *thrown overboard*; the mind and agency of man must be employed to recover for general average. *Dig.* 14, 2. 1. *Mouse's Case*, 12 *Co.* 63. mentioned also in *Bird v. Astock*, 2 *Bulst.* 280. *Park*, 124. 6. *Lex Merc.* 2 *Term R.* 407.

Definition and acceptance of the word *average*. 3 *Burr.* 1555.

Where owners are liable to contribute. 2 *Magens*, 96, 283. *Molloy, tit. average*, 7, 12.

Diamonds and jewels must contribute. *De Leg. Rhod. s. 2. art. 8. Oler. art. Wisb. art. 20. Molloy, l. 2. c. 8. s. 4.*

Ships' provisions, wearing apparel, &c. bottomry and respondentia bonds, sailors' wages, &c. shall not. *De Leg. Rhod. s. 2. art. 8. Oler. art. Wisb. art. Molloy, l. 66. c. 8. s. 4.*

Where a ship is obliged to go into port for the benefit of the whole concern, expence of repairs, &c. are *general average*. *Da Costa v. Newnham*, 2 *T. R.* 407.

Goods stowed upon deck are excluded from *general average*. *Liv. 5. tit. Du. Jet. art. 13. Mayer and others v. Vander Doyl, Sittings at Guildhall, Dec. 1803. Backhouse and another v. Ripley, tried before Chambre J. a short time before; Abbott, part III. c. VII.* Principle on which *general average* is to be calculated. 1 *Mag.* 59. *Abbott, part. III. c. VIII.* 528.

Customary for a broker to draw up adjustment of *average*. *Shepherd and others v. Wright, Show. Parl. Case*, 18.

What sort of estimate must be made in

settling gross average. *Beawes' Lex Merc.* fo. edit. 149.

Charge of reclaiming ship, wages, and expenses of ship's company, may be brought into a general average. *Magens*, 290.

When contribution of general average is made. *Peters v. Milligan, Sittings after Mich.* 787.

Small or petty averages do not fall on the underwriter. *2 Mag.* 189, 278.

AVERMENT.

Where averment is good. *Knight v. Cambridge*, 2 *Ld. Raym.* 1549. 1 *Stra.* 581. *Park*, c. 20. *Gardiner v. Crosedale*, 2 *Burr.* 904. 1 *Black. Rep.* 198. *Page v. Rogers, Sittings after Hil.* 1785. *Nantes v. Thompson*, 2 *East*, 385. *Perchard v. Whitmore*, 2 *Bos.* and *P.* 155. n. *Page v. Fry*, *ibid.* 240. (See also *tit. Proceedings*.)

BARRATRY,

Derivation and definition of. *Coup.* 154. *Knight v. Cambridge*, 1 *Stra.* 581. *Stamma v. Brokin*, 2 *ibid.* 1173. *Vallejo v. Wheeler. Coup.* 143. 1 *Term Rep.* 323.

It is barratry in the master to smuggle. *Coup.* 143. *Lockyer v. Offley*, 1 *T. R.* 252. *Havelock v. Hancel*, 3 *ibid.* 277, on demurrer. 1 *ibid.* 127.

Freighter considered owner *pro hac vice*, and if master commit criminal act without his privity, though with knowledge of original owner, it is barratry. *Coup.* 143. 154.

Act of captain, with knowledge of owner of the ship, without privity of owner of goods, is not barratry. *Natt and others, assignees of Hague, v. Bourdieu.* 1 *T. R.* 323.

If master of the ship be also owner, he cannot be guilty of barratry. *Park*, 94.

In an action for loss by barratry, proof of that person described as master, without showing negatively that he was not the owner, or affirmatively that another person was, held sufficient to entitle plaintiff to recover. *Ross v. Hunter*, 4 *T. R.* 33.

Not necessary loss should happen 4 *ibid.* very act of barratry. 1 *T. R.* 252. in the 33. *Coup.* 143. *Park*, 84, 90.

The moment ship is carried from its proper track with evil intent, it is barratry. *idem.*

Assurer undertakes against barratry of master, &c. though appointed by insured, which is peculiar to law of England. *Park*, 85.

If ship take a prize, and is obliged to return to port therewith, against orders of owners, it is not barratry. *Elton v. Brogden*, 2 *Stra.* 1264. Punishment of barratry, and statutes for prevention thereof. *De Frise v. Stephens*, 1 *July*, 1800. 1 *Anne*, st. 2. c. 9. 12 *Anne*, st. 2. c. 18. 11 *Geo.* 1. c. 29. 29 *Geo.* 3. c. 46. Case of *Easterby and Macfarlane*, tried at Admiralty Sessions, 1802. See *Addenda per East's Pl. of the Crown*, xvi. 11 *Geo.* 1. c. 29. s. 5, 6, 7. 43 *Geo.* 3. c. 113.

Where master had general instructions to

make purchases with dispatch, he was not warranted in going to an enemy's settlement — deemed barratry. *Earle and others v. Rowcroft*, 8 *East*, 126.

Barratry in master, not paying port duties, whereby goods are forfeited. *Knight v. Cambridge*, *ib.* 135.

If captain, contrary to instruction of his owners, cruize for and take a prize, and his vessel is afterwards lost, it is barratry. *Moss v. Byrom*, 6 *T. R.* 379.

Deviation of captain through ignorance, barratry. *Phyn v. Royal Ex. As. Com.* 7 *T. R.* 505.

BILL OF LADING

Held to be complete acknowledgment of captain of receipt of goods. *Caldwell and others v. Ball.* 1 *T. R.* 205.

Assignable in its nature, *id.*

Where there are several bills of lading, of same date, but different imports, no reference to be had to time when first was signed by captain. *Hibbert v. Carter*, 1 *T. R.* 145. *Kulen and Kemp v. Vigne*, 1 *ibid.* 304. *Taylor v. Royal Ex. As. Com.* 8 *East*, 393.

A bill of lading is not a necessary instrument of the transfer of property in goods consigned to the owner. *Meyer v. Sharpe*, 5 *Taunt.* 80.

A bill of lading may operate as a contract between the master and consignee for payment of demurrage, as well as freight. *Lees v. Yates*, 3 *Taunt.* 387.

There is no distinction between a bill of lading indorsed in blank, and an indorsement to a particular person. *Lickbarrow v. Mason*, 2 *T. R.* 63.

The usual clause in a bill of lading, engaging the master of the ship to deliver the goods to the consignee or his assigns, *he or they paying freight for the same*, is introduced for the benefit of the master only, and not for that of the consignee, and the master is not bound to consign or to withhold delivery unless the consignee or his assigns pay freight. *Shepherd v. De Bernales*, 13 *East*, *R.* 565.

BOTTOMRY.

Bottomry and respondentia bonds do not contribute to general average. *De Leg. Rhod.* s. 2. art. 8. *Oler. art. Wisb. art.* 20. *Molloy*, l. 2. c. 8. s. 4.

All sums lent on *bottomry* and *respondentia* shall be lent only on ship and merchandise, and so expressed in bond, 19 *Geo.* 2. c. 37. s. 5.

And must be mentioned and specified in policy. *Glover v. Black*, 3 *Burr.* 1594.

Definition of *bottomry*. 2 *Blackst. Com.* 457. *Ibid.* 458. 2 *Valin. Com.* p. 4.

Distinction between *bottomry* and *respondentia*. 2 *Valin. Com.* p. 4.

Various application of term *bottomry*. 2 *Blackst. Com.* 458. 1 *Siderfin.* 27.

Legislative regulations contained in 19 *Geo.* 2. c. 37. *Molloy*, lib. 2. c. 11. s. 8. Above act does not mean to prevent king's subjects

from lending money on *bottomry* on foreign ships trading from their own country to their settlement in the East Indies. 19 Geo. 2. c. 27. s. 5. *Sumner v. Green*, 1 H. B. 501. act.

Loan upon voyage without a security upon ship or goods, is entirely prohibited by the laws of France. Ord. de Lou. 14 tit. de Contrats à grosse avant. art. 3. Loc. cit. art. 15.

Origin of *bottomry* and *respondentia*. 1 Blackst. Com. 457. *Barnard v. Bridgman*, Moor, 918. fully reported in *Hobart*, p. 11.

Master may hypothecate either ship or goods. *Justin v. Ballam*, 1 Salk. 34. The ship *Gratitudine*, 3 Robinson's Adm. Rep. p. 240. *Molloy*, b. 2. c. 2. s. 14. Leg. Oler. art. 1. c. 22. Laws of the Hanse Towns, art. 60. *Hobart*, 11. *Noy*, 95.

Ship must be abroad, as well as in a state of necessity, to justify captain in taking money on *bottomry*. *Molloy*, l. 2. c. 11. s. 11. *Molloy*, Loc. cit. Ord. of Lou. 14. tit. avant. à la grosse, art. 8. c. 9. 2 Valin. Com. 10.

Lenders on *bottomry*, or at *respondentia*, run nearly the same risk as insurer. *Pothier*, Tr. du pret à la grosse avant, not. 6.

Ancients well acquainted with *bottomry* and *respondentia*. Leg. Rhod. s. 1. art. 21. Leg. Rhod. s. 2. art. 16. Digest. lib. 22. tit. 2. Cod. lib. 4. tit. 33. 2 Valin. Coms. 1. Laws of Oleron, art. 1 and 2. Laws of Wisberg. art. 45.

If ship arrive safe, lender on *bottomry* shall be paid his principal, however much it exceeds the legal rate. *Molloy*, lib. 2. c. 11. s. 8. 13. 2 Ves. 148. 154. 12 Anne, st. 2. c. 16. *Pothier*, not. 16.

Usury cannot be pleaded to actions for obligations on *bottomry*, &c. as on account of risk, the interest shall be larger than the common rate. *Sharpley v. Hurrell*, Cro. Jac. 208. *Roberts v. Tremayne*, Cro. Jac. 508. *Joy v. Kent*, Hard. Rep. 418. *Park*, 5th edit. 417. *Soame v. Gleen*, 1 Sid. 27. 1 Lev. 54.

But a court of equity will not assist a *bottomry* bond which carries unreasonable interest. *Dandy v. Turner*, 1 Equity Cases, Abr. 372.

If a contract were made by colour of *bottomry* in order to evade the statute, it would be usurious and void. 4 Com. Dig. 193. 2 Ves. 146.

Where ship does not perform voyage, and lender incurs no hazard, he should lose the premium, and be content with principal and ordinary interest. *Deguilder v. Depeister*, 1 Vern. 265.

Commencement of contingency in *bottomry* bond. *Beawes' Lex Merc. Red.* 4th edit. p. 127.

Amount of loan on *bottomry* or *respondentia* not restrained by any regulation. 19 Geo. 2. c. 37. s. 50.

Lender is likewise answerable for losses by capture. *Joyce v. Williamson*. B. R. Mich. Term, 23 Geo. 3. *Park*, 5th edit. 422.

But if a ship be taken and detained for a short time, and yet arrive at destined port within time limited, bond is not forfeited. *Id.*

Lender on *bottomry* or at *respondentia* not entitled to benefit of salvage, nor liable to contribute in case of general average. 19 Geo. 2. c. 37.

In an action on a *respondentia* bond, the ship being Danish, and an average loss sustained, held that plaintiff was entitled to recover, as by the law of Denmark lenders upon *respondentia*, &c. are liable to average, and bound to contribute. *Walpole v. Ever*, Sitt. aft. Trin. 1789.

Where ship deviates from voyage described, lender not bound to bear the loss. *Weston v. Wildy*, Skinn. 152. *Williams v. Steadman*, Holt's Rep. 126. *Skin*. 545. S. C. 1 Eq. Cases, Abr. 372. 2 Ch. Cases, 150.

Obligee in any *bottomry* or *respondentia* bond may be admitted to claim under a commission of bankruptcy, and receive a dividend. 19 Geo. 2. c. 32. See second section of this statute.

BROKER

Has a *lien* on policies; though he part with possession of policy, if it returns into his hands *lien* revives. *Whitehead v. Vaughan*, Trin. 25 Geo. 3. *Parker v. Carter*, Trin. 1788. When no *lien*. 1 East, 335.

May open policy in his own name, declaring for whose use, &c. 25 Geo. 3. c. 44. 28 Geo. 3. c. 56. 1 Burr. 490.

If limited to too small a premium (whereby insurance cannot be effected), merchant is liable to his correspondent. 2 Term Rep. 188, note (a).

Broker to draw up adjustment of average. *Shepherd v. Wright*, Show. Parl. Cas. 18.

Is only authorized to receive payment of loss from underwriters, for the assured in money; and therefore a custom to set off the general balance due from broker to underwriter, in the settlement of a particular loss, is illegal. *Todd v. Reid*, 4 B. & A. 210.

CAPTURE,

Definition of. *Park*, c. 4. 2 Burr. 694.

No capture can be so total a loss, as to leave no possibility of recovery. 2 Burr. 696. 29 Geo. 2. c. 35. s. 24. 33 Geo. 3. c. 66. s. 42. 2 Burr. 683. *Park*, 66.

Effect, re-capture had, upon contracts of insurance before, 19 Geo. 2. c. 37. 10 Mad. 77. 2 Burr. 695. Com. 360. 1 Wils. 191. 2 Strat. 1250. *Park*, 73, 77. 2 Burr. 695. 1198.

On payment of salvage in case of re-capture, right of original owner preserved to him for ever. See 43 Geo. 3. c. 160. s. 39. and 45 Geo. 3. c. 72. s. 7.

A capture having been illegal, but charges, &c. being great, insured made compromise on liberation of ship. Underwriter held answerable for charges of such compromise. *Berens v. Buckner*, 1 Black. Rep. 312.

Rule not settled among nations, as to pre-

cise period when property is diverted by capture. *Helena, Heslop*, 4 Rob. A.R. 3.

Marine law of England, as to capture. 1 Rob. A. R. 139. See ante, I. 3. *Geyer v. Aguilar*. *Christie v. Secretan*. *Oddy v. Bovil*. *Bolton v. Gladstone*. *Baring v. Roy*. *Ex. Ass. Comp.*

States in alliance with the captors, and at war with the country to which captured ship belongs, form one community with captor. *Oddy v. Bovil*, 2 East, 473.

And prize carried into such state may be legally condemned. *The Christopher, Slyboom*, 2 Rob. A. R. 109.

Unlawful for British subjects to ransom ship captured by enemy. Penalty 500*l.* 22 Geo. 3. c. 25. sec. 1. sec. 3. 43 Geo. 3. c. 160. s. 34, 36. 33 Geo. 3. c. 66. 43 Geo. 3. c. 160. s. 33.

Sum paid on account of ransom, not recoverable from underwriters. *Havelock v. Rockwood*, 8 Term Rep. 268.

CHANGING SHIP,

Proceedings in regard to. *Dick v. Barrel*, 2 Stra. 1248.

Insured have no right to change ship, as one may be less able to resist perils of the sea, or sail faster, so as to escape an enemy, than another, and consequently alters the risk. 1 Burr. 351. See *Plantamous v. Staples*, 1 Term Rep. 611. note.

But if necessity required, ship may be changed. *Park*, 19. a. 290.

CONCEALMENT

Vitiates all contracts of insurance. *Park*, c. 10. *Dougl.* 247. 260. *Park*, c. 10. *Skinn.* 327. 3 Burr, 1419. 1 Black. Rep. 427. 2 P. Wms. 170. 1 Black. R. 463. 594. *Park*, c. 10. *Carter v. Boehm*. 3 Burr. 1905. 1 Black. Rep. 593. *Littledale and others, assignees of Kenyon v. Dixon*, 1 Bos. and Pull. New Reports, p. 151.

Policy is void if broker conceal any material circumstances, though the only ground for not mentioning them should be, that the facts concealed appeared immaterial. *Park*, c. 10. *Cowp.* 785. *Dougl.* 247. *Dougl.* 260. *Bize, v. Fletcher*, *Dougl.* 271; or *Lavabre v. Wilson*, 271. 284. See ante, I. 3, *Shirly v. Wilkinson*, *Doug.* (295) 306. n.

What is not deemed fraudulent concealment. *Thompson v. Buchanan and another*, 4 Bro. Parl. Cases, 482. *Freeland and another, assignees of Tipping*, a bankrupt, *v. Glover*, 7 East, 457.

If a ship is advertised to be in danger, and the insurer effect a policy on ships, knowing that the ship in danger is one of them, without stating the ships' names, this is a concealment which avoids the policy, even though the rumour was false. *Lynch v. Hamilton*, 3 Taunt. 37.

If insurer effect a policy on ship or ships knowing their names, but not communicating them, such an insurance is tantamount to a representation that he does not

know by what ships the goods will come. *Ibid.*

But it is not necessary to disclose to the underwriter on a policy at and from London, whether the ship has sailed, or not. *Tort v. Lee*, 3 Taunt. 381.

It was known at Lloyd's that a particular ship of Bristol was at sea without convoy, and the broker enquired of plaintiff at Bristol if that ship was insured, and was informed it was, and plaintiff supposed adverse winds had prevented her joining convoy; but broker got policy altered without disclosing this answer to underwriters. This concealment voided the policy. *Sawtell v. London*, 5 Taunt. 363.

CONDEMNATION.

Condemnation on ground of infraction of treaty, in not being properly documented, conclusive against warranty of neutrality. *Baring v. Christie*, 5 East, 398.

Condemnation on goods warranted American, though in ship hired and loaded at London, and destined for the English islands, not conclusive evidence against warranty of neutrality. *Calvert v. Bovill*, 7 Term Rep. 523.

Condemnation of ship warranted American, for want of role d'*equipage*, or list of crew, conclusive against warranty of neutrality, though really American. *Geyer v. Aguilar*, 7 Term Rep. 681.

Practice of courts relative to sentences of foreign courts of admiralty. *Park*, c. 18. ad fin. *Dougl.* 554. 574. *Bernardi v. Motteux*. *Christie v. Secretan*, 8 Term Rep. 192. *Havelock v. Rockwood*, 8 Term Rep. 268. *Price v. Bell*, 1 East, 663. *Wright v. Barnard*, *Sittings after Mich.* 1798.

Sentence of foreign court conclusive on a policy, upon every matter within jurisdiction of such court. *Bolton v. Gladstone*, 5 East, 155.

CONSIGNEE

May insure commissions. *Flint v. Le Mesurier*, *Sittings after Hil. Term*, 1796.

CONVOY.

Unforeseen separation from convoy renders underwriters liable. 3 Ler. 320. 2 Salk. 443. *Carth.* 216. 1 Show. 320. 4 Mod. 58. S. C.

Where ship is prevented from joining convoy by tempestuous weather, yet endeavours to do so, deemed a satisfaction of warranty to sail with convoy. *Victoria v. Cleeve*, 2 Stra. 1250.

Penalty on captain of merchant-ship, under convoy, disobeying signals or instructions, 500*l.*

The term *convoy*, in a policy, means such convoy as shall be appointed by government. *D'Eginno v. Bewick*, 2 H. B. 551.

The 43 Geo. 3. c. 57. is the great statute for the regulation of convoys; by that stat. a policy is not avoided on the ground of the ship sailing without convoy, unless the party

interested in the insurance was privy to it. *Henderson v. Hind*, 1 Taunt. 250.

DETENTION.

What is deemed a detention. *Park*, 78. 2 Burr. 696.

On detention by foreign power, to search for enemies property, costs and charges, &c. must be borne by underwriter. *Sallouci v. Johnson*, B. R. Hill. 25 Geo. 3.

But not on detention for non-payment of customs, or navigating against laws of those countries. 2 Vern. 176.

Uncertain whether detention by power of country to which ship belongs is within the policy. *Green v. Young*, Ld. Raym. 840. 2 Salk. 444.

In case of loss by detention, assured must abandon, as detention includes and entitles assured to abandon, and recover for a total loss. *Park*, 82.

DEVIATION.

What is so understood. *Roccus*, Not. 52. Dougl. Rep. 288. *For v. Black*. Townson v. Guyon, *Park*, 295. *Elliot and others v. Wilson's Crs.* 4 Bro. Parl. Cases, 2d edit. 470.

Whenever deviation is occasioned by absolute necessity, the underwriter continues liable. *Elton v. Brogden*, 2 Stra. 1264.

It is no deviation when ship is obliged by storm, &c. to make the nearest port to refit 1 Term R. 22. 2 Salk. 445. 2 Stra. 1265. *Motteux and others v. the Lond. Ass. Com.* 1 Atk. 545. *Park*, c. 17.

So if to escape a storm she goes out of her course, or is driven thereout by stress of weather. *Delaney v. Stoddard*, 1 T. R. 22. *Park*, c. 17.

Deviation may be justified if done to avoid an enemy, or seek convoy. *Bond v. Gonsales*. 2 Salk. 445. *Gordon v. Morley*, Campbell v. Bordieu, 2 Stra. 1265. *Park*, c. 17. § 2.

In case of deviation from necessity, ship must pursue such voyage of necessity in the direct course, and in the shortest time possible. *Lavabre v. Walter*, Dougl. (271) 284.

Deviation merely intended, but never effected, does not discharge insurers. *Foster v. Wilmer*, 2 Stra. 1249. *Thelluson v. Ferguson*, Dougl. 546, 561. *Green v. Young*, 2 Ld. Raym. 840. 2 Salk. 444. S. C.

Wilful deviation from the due course of voyage insured, is a determination of policy. *Elliot and others v. Wilson and Co.* Bro. Parl. Cases, 2d edit. 470.

If voyage described in policy be from A. to B. and C. and the ship go to C. before B. (though C. be nearer to A. than B.), it is a deviation, if it be not the regular course of the voyage to C. first. *Beatson v. Haworth*, 6 T. Rep. 531.

Deviation from voyage insured, through ignorance of captain, though it void policy, is not barratry. *Phyn v. Royal Ex. Ass. Company*, 7 Term Rep. 505.

On policy for goods "against sea risk and fire only," ship was carried out of her course by a king's vessel and being afterwards releas-

ed, proceeded on the voyage, and sustained sea damage, underwriters held liable, *Scott and another v. Thompson*, 1 Bos. and Pul. New Rep. 181.

Policy on ship with or without letters of marque, giving leave to chase, capture, and man prizes, will not warrant, after capture, shortening sail and lying to for protection of prize, although port within voyage insured. *Laurence and others v. Sydebotham*, 6 East, 45.

Nor authorise direct cruising out of the voyage. *Pan v. Anderson*, 6 East, 202.

DOUBLE ASSURANCE

Different from re-assurance, and is not void. 1 Burr. 496. *Park*, 285.

Cases in which double insurances may be made. 1 Black. Rep. 416. 1 Burr. 492. *Godin v. London Ass. Comp.* 1 Burr. 489. 1 Black. Rep. 105.

EAST INDIA VOYAGES,

Usage of trade in respect of. *Salvador v. Hopkins*, &c. 5 Burr. 1707, & seq. *Lavabre v. Wilson*, and *Lavabre v. Walter*, Dougl. 234.

EMBARGO.

Ship arriving at a port where an embargo is previously laid, and the day after extended to her, not deemed moored in safety twenty-four hours. *Minet v. Anderson*, *Park*, 211. *Sittings after Hil.* 34 Geo. 3.

Effect of embargo by this country on ship insured here; any act done in contravention of embargo is illegal. *Rotch v. Edie*, 6 Term Rep. 422. *Hadley v. Clark*, 8 Term Rep. 259. *Thompson v. Rowcroft*, 4 East. 34.

ENEMY,

Trading with, illegal. *Potts v. Bell*. 8 T. R. 548. *Vandyck v. Whitmore*, 1 East's R. 475. *Brandon v. Nesbitt*, 6 T. R. 23. *Gamba and another v. Le Mesurier*, 4 East, 407. *Lubbock v. Potts*, 7 East, 449.

As also insurances on enemies' ships. *Id.*

But enemies' ships taken, and condemned as lawful prizes, may become entitled to privileges and advantages of British ships under the regulations of the register acts and 45 Geo. 3. c. 32.

FIRE, INSURANCE AGAINST.

Definition. *Park*, c. 23.

Construction therein. *Park*, c. 23.

Clause of London Assurance and some other offices, that they do not hold themselves liable for any loss or damage by fire happening by any invasion of foreign enemy, or any military or usurped power. *Ibid.*

Question, what species of insurrection should be deemed a military or usurped power? It was held by the Court of Common Pleas, against the opinion of Mr. Justice Gould, that it could only mean to extend to houses set on fire by means of an invasion from abroad, or of internal rebellion, when armies are employed to suppress it. *Park*, c. xxiii. *Drinkwater v. the Corporation of the London Assurance*, 2 Wils. 363.

Proviso against civil commotion by Sun Fire Office deemed good. *Longdale v. Mason and*

others, *Sittings at Guildhall, Mich. Vac. 1780. Park, c. xxiii.*

Loss happening within fifteen days appointed for renewal of policy, but before premium paid; does not entitle assured to recover. *Tarleton and others v. Stangforth, 5 Term Rep. 695.* This judgment was afterwards affirmed in the *Ex. Chamber, 1 Bos. and Pull. 471.*

Notice of *Phoenix Company* that they would hold themselves liable for loss during fifteen days, notwithstanding above judgment. *Ibid.*

When fire happens, insured must give immediate notice, and make proof of loss by affidavit, &c. and produce certificate from churchwardens, &c. *Park, c. xxxiii.*

Printed proposals, requiring certificate, held as part of the policy, and that such certificate is a condition precedent to right of assured to recover, and cannot be dispensed with. *Worsley v. Wood, 6 Term Rep. 701. 2 H. Black. Rep. 573. S. C.* See also *Roulledge v. Burrell, 1 H. Black. 254.*

When loss is sustained and adjusted, sufferers are to receive immediate satisfaction without any deduction. *Lex Mercatoria.*

Policies are not in their nature assignable. *Delaney v. Stoddard, 1 T. Rep. 26. Lynch and another v. Dalzell and others, 3 Brown's Parl. Cases, 497.* But where person dies, policy and interest shall continue to the heir, executor, &c. *Park, c. xxiii.*

Assignment executed after loss null and void. *Delaney v. Stoddard, 1 T. Rep. 26. Salvin v. James, 45 Geo. 3. 6 East, 571.*

No insurance takes place till premium actually paid. *Idem.*

On notice from office to pay increased premium, if insured do not comply, they cannot recover. *Idem.*

FOREIGN PROPERTY.

Doubts as to extension of, 19 G. 2. c. 37. with regard to insurance on foreign property. *Thelluson v. Fletcher, Dougl. 301.*

FRAUD

Annuls all policies. *Grot. de Jure Belli, lib. 2. c. 12. sec. 23. Puffendorf de Jure Nat. l. 5. c. 9. sec. 8. Bynkershoek Quest. Jur. p. 4. c. 26. Or de Lew. 14. sec. 38.*

Various cases of fraud. *Park, c. 10. Dougl. 247. 260. Park, c. 10. Skinn. 327. Burr. 1419. 1 Black. Rep. 427.*

Misrepresentation will void policy equally as fraud. *Park, c. 10. Coup. 785. Dougl. 247. Dougl. 260. Bize v. Fletcher, Dougl. 271.; or Lavabre v. Wilson, 271. 284.* See ante, 1. 3. *Shirley v. Wilkinson, Dougl. (293) 306. n.*

In all cases of fraud, immaterial whether it be act of person himself or his agent. *Stewart v. Dulop, in Dom. Proc. 1785. Fitzherbert v. Mather, 1 Term Rep. 12. Park, c. 10.*

Policy will not set aside on the ground of fraud, unless fully and satisfactorily proved. *Park, 214.*

Positive and direct proof of fraud not necessary. *Roccus, Not. 51. 78. Middlewood v. Blakes, 7 Term Rep. 162.*

Statutes for punishment of fraud in policies. 1 Ann. st. 2. c. 9. 4 Geo. 1. c. 12. s. 4. 43 Geo. 3. c. 113. s. 1. *Rex v. Easterby and Macfarlane, at the Admiralty Sessions, Oct. 1802.*

FREIGHT

Cannot be recovered by insured, if accident prevent ship from sailing. *Tonge v. Watts, Sitt. after Trin. 1791. 1251.*

But if policy be a valued one, and part of cargo on board, freight may be recovered. *Montgomery v. Egginton, 3 Term R. 362.*

Where ship chartered from A. to B. to take goods and proceed to C. for which freight was to be paid at so much per ton. policy attached from sailing of ship. *Thompson v. Taylor, 6 T. Rep. 478.*

No insurable interest in freight, unless legal transfer of ship. *Camden v. Anderson, 5 T. R. 709.*

Insured cannot recover, if ship does not carry her freight to its destined port. *Seller v. M'Vicar, 1 B. and P. New Rep. p. 25.*

Insurance for freight will attach while delivering outward cargo, and before homeward are shipped. *Annesley on Insurance, p. 44.*

Freight being received at so much per month, was earned at the end of each month, although the stipulated time of payment were from four months to four months (beginning at the end of two months), and the ship were lost before the end of fourteen months. *Havelock v. Geddes, 10 East. R. 555.*

If the owner of a ship, having chartered her for a voyage, assign her before the voyage, though he afterward assign the charter-party to another, if she earn freight, the assignee of the ship is entitled to the freight as incidental to the ship. *Morrison v. Parsons, 2 Taunt. 407.*

If the master be prevented by fault of consignees, or restraint of governments, from delivering the whole cargo, he shall be entitled to freight *pro rata* for part delivered. *Christy v. Row, 1 Taunt. 300.*

If ship be freighted for single voyage outward, and be prevented from delivering her cargo, she shall be entitled to freight for bringing it back, and master would not be entitled on losing delivery, to cast away residue of cargo. *Ibid.*

ILLEGAL VOYAGES.

Insurance made on voyage prohibited by law, void *ab initio.* *Johnston v. Douglas, Dougl. 241. Camden v. Anderson, 6 T. R. 723. 1 Bos. and Pul. Rep. 273. Wilson v. Marryat, 8 T. R. 31. 1 Bos. and Pull. 430. Bird v. Appleton, 8 T. R. 562. 1 Black. Com. 270. Grot. de Jure Belli, lib. 2. c. 2. sec. 10. Delmaaa v. Motteur, B. R. Mic. 25 Geo. 3. Lever v. Fletcher, Park, 237.*

INFRACTION OF TREATY.

Condemnation of ship on ground of in-

fraction of treaty, in not being properly documented, &c. conclusive against a warrant of neutrality. *Baring v. Royal Exchange Assurance Company*, 5 East, 99.

INSURANCE.

On seamen's wages prohibited. *Webster v. De Tastet*, 7 Term Rep. 157.

"On goods" generally does not include goods lashed on deck, captain's clothes, or ship's provisions. *Park*, 21. *Abbott*, on merchants' ships, &c. Part. III. c. viii. 323. See PORT.

"On ship and furniture," includes provisions sent out for the use of the crew. 4 Term Rep. 206.

"On goods till safely landed," damaged in lighter, renders underwriter liable. *S. P. Rucker v. London Assurance Company*, Guildhall, 8th June, 1804, coram Buller J. 432, note (a).

"On goods till safely landed," lost in a lighter, cases where underwriter was not liable. *Strong v. Nataly*, 1 Bos. and Pull. New Rep. 16. See *Sparrow v. Carruthers*, 2 Stra. 1256. Where a party by taking goods into his own lighter, discharged the underwriters. *Rook J.* observed, that in *Hurry v. the Royal Exchange Company*, they did not intend to shake the authority of *Sparrow v. Carruthers*. *Ib.* p. 19.

May be effected on profits of a cargo. *Barclay v. Cousins*, 2 East, 544.

Ditto on a fort against attacks of an enemy. *Carter v. Boehm*, 3 Burr. 1905.

Ditto on goods, though purchased with the proceeds of a former illegal cargo. *Bird v. Appleton*, 8 Term Rep. 562.

Ditto on imaginary profit. *Henrickson v. Margetson*, 2 East, 549. in n.

Ditto on enemy's property prohibited. See Post. III. 5. 7. *Brandon v. Nesbitt*, and *Bristow v. Towers*, 6 Term Rep. 23 and 35. *Potts v. Bell*, 8 Term Rep. 548.

Cannot be effected on slaves in certain cases. 34 Geo. 3. c. 80. s. 10. continued by 39 Geo. 3. c. 80. s. 24, 25.

On alien property, cannot extend to cover any loss during existence of hostilities between the countries of the assured and assurer. *Brandon v. Curling*, 4 East, 410.

On freight will attach while delivering outward cargo, and before homeward are shipped. *Annesley on Insurance*, p. 44. made in order to protect smuggled goods, or in contravention of navigation acts, void. *Park*, 255. 4 & 5 W. & M. c. 15. s. 14, 15, & 16. and 8 & 9 W. 3. c. 36. s. 1. *Mir.* c. 1. s. 3. 11 Ed. 5. c. 1. 8 Eliz. c. 3. 12 Car. 2. c. 32. 7 & 8 Wm. 3. c. 28. 4 Geo. 1. c. 11. 12 Geo. 2. c. 21. s. 29 and 33. 28 Geo. 3. c. 38. s. 45. 33 Geo. 3. c. 52. s. 146. *Camden and others v. Anderson*, 6 T. R. 723, and 1 Bos. and Pull. 272.

On privateer valued at 1000*l.* for cruise of four months, without further account, and free from average. Crew mutinied, and benefit of cruise was lost; but ship was in

safety at expiration of four months. Underwriters not liable. *Fitzgerald v. Pale*. 4 Bro. Parl. Cases, 2d edit. 459.

Equitable construction as to insurance on merchandize, &c. from places in Europe or America belonging to Spain or Portugal. 19 Geo. 2. c. 37.

A. having insured 800*l.* on his own ship, and being indebted to B. deposits with him several securities, and makes an assignment of ship. Underwriters cannot depend on ground of A. having no interest. *Alston and others v. Campbell*, 4 Bro. Parl. Cases, 2d edit. 476.

Upon joint capture by army and navy, officers and crews before condemnation, having an insurable interest. *Le Cras v. Hughes*, B. R. East. 22 Geo. 5.

Insurances made by persons having no interest are void. *Kent v. Bird*, Cowp. 583. *Lowry and another v. Bourdieu*, Dougl. 451.

A natural born subject domiciled in a foreign country in amity with this, may lawfully exercise the privileges of the country where he is domiciled; and may effect an insurance on a ship from that country to another at war with this. *Bell v. Reid*, 1 M. & S. Rep. 726.

INSURERS,

Who may be? (6 Geo. 1. c. 18.) ans. Royal Exchange Company and the London Assurance Company. Policies, therefore, are now either underwritten by these companies, or individual underwriters; a policy subscribed by any society or partnership being absolutely void. *Park*, 5th edit. p. 5. 9. *Lees v. Smith*, 7 Term Rep. 358. *Brunton v. Taddy*. 1 Taunt. Rep. 6.

LICENCE.

Trading under licence with an alien enemy for specie or goods brought in his ships, incidentally legalizes insurance on enemy's ship, as well as goods of British subject. *Annesley on Insurance*, p. 44.

A licence to trade, which is to expire on a certain day, will protect the adventure beyond that day, if it be protracted by events which the licensed party cannot controul; and that, even though the cargo be not shipped till after the licence be expired. And where a homeward-bound cargo shipped without laches, after the licence expired, was through perils of the sea necessarily unladen in the course of the voyage, and destroyed by fire on shore; it was decided that the licence protected a cargo of the specified goods substituted for the cargo burnt. *Siffhon v. Glover*, 4 Taunt. 717.

If a vessel bring from an hostile country, under a licence, a cargo of enumerated goods, and other goods not licensed, the insurance on the licensed goods is not vitiated. *Pieschel v. Allnut*, 4 Taunt. 792. See further case on licence to export, 4 B. & A. 184.

LIEN.

Broker has a lien on policies, and though he parts with possession of policy, yet if it

returns into his hands *lien* revives. *Whitehead v. Vaughan*, Trin. 25 Geo. 3. in *B. R. Parker & al. v. Carter*, C. P. Trin. 1788.

In what case broker has not a *lien*. *Maans v. Henderson*, 1 East, 355.

LIVES, INSURANCE ON.

Definition. 1 *Postlethw. Dic. of Fr.* p. 150.

Advantages resulting from such insurance.

1 *Postlethw.* 150.

History of different societies. *Park*, c. xxii.

Antiquity of this practice uncertain. *Le Guidon*, c. 16. art. 5. published in 1661.

No insurance can be made, unless person effecting one has an interest in the life insured. 15 Geo. 3. c. 48. s. 1, 2, 3.

A person holding a note for money won at play, has not an insurable interest in the life of the maker of the note. *Dwyer v. Eddie*, London Sitt. after Hil. 1788. *Park* c. xxii.

But a creditor has an insurable interest in the life of his debtor. *Anderson v. Eddie*, B. R. London Sitt. in Tr. T. 1795.

All policies of a gambling nature, or in which there is no interest, are void. *Park*, c. xxii.

Policy may be bequeathed to persons not parties to the insurance, and executor may support an action. *Tidswell v. Angerstein*, Peak. N. P. Cases, 151.

Fraud affects a life policy the same as another. *Park*, c. xxii.

Loss must happen within time in policy. *Park*, c. xxii. The case of *Lockyer v. Offley*, 1 T. R. 252, was here stated by Mr. Justice Willes. *Patterson v. Black*, Sittings at Guildhall, Hil. Vac. 1780.

Full sum must be paid when loss happens. *Lex Merc. Red.* 4 edit. p. 294.

Doubts as to extension of 19 Geo. 2. c. 37 s. 2. to life policies removed. *Cox v. Liotard*, Dougl. Rep. p. 166. note. *Patteson v. Bankes*, Coup. Rep. 540. *Mace v. Fadell*, Coup. 252.

Above act held to extend to bonds for payment of annuity. *Ibid.*

Statute of *James* construed to extend to goods of third person. *Mace v. Cadell*, Coup. 252.

Formerly a doubt, when a policy was to run from the date thereof till that day twelvemonth, and the person died on the day named; whether insurer was liable—held that he was. *Sir Robert Howard's case*, 2 Salk. 625. 1 Ld. Raym. 480. S. C. Vide *Pugh v. The Duke of Leeds*, Coup. Rep. 714.

Day of date, &c. shall be either *exclusive* or *inclusive*, according to the context and subject matter. *Ibid.*

Usual, to prevent disputes, to insert in modern policies "the first and last days included." *Ibid.*

Where there is no warranty, underwriter runs the risk of its being a good life or not. *Stackpole v. Simon*, Sittings at Guildhall, Hil. Vac. 1799.

And where there is a warranty, it is sufficient that he is in a reasonable good state of

health, for it never can mean that he is free from the seeds of disorder. *Ross v. Bradshaw*, 1 Black. Rep. 312. *Park*, 439.

If even insured laboured under particular infirmity, if it be proved that it did not contribute to his death. Warranty has been complied with, *ibid.* *Wallis v. Poole*, Sitt. at Guildhall, after Easter Vac. 1780. *Park*, 439.

When risk once begun, there is no apportionment or return of premium, although it should cease the day after its commencement. *Tyrie v. Fletcher*, Coup. 669. *Bermon v. Woodbridge*, Dougl. 789.

Declaration of person, and apprehension that she could not live ten days longer, admissible evidence to show her own opinion, who best knew the ill state of her health at the time of effecting policy. *Aveson v. Ld. Kinnaird*, 6 East, 188.

LOSS.

What is considered as a total loss. 1 T. R. 150. n. (a.) *Park*, 98. 145.

In what case insured may call upon underwriter for a total loss. *Ibid.* *Hamilton v. Mendes*, 2 Burr. 1108. 1 Black. Rep. 276.

Proof of interest necessary for total loss on an open policy, *aliter* on a valued one. See ante, l. 4 *Park*, 105. 111.

Any thing that human prudence could not foresee, or human strength prevent, is a loss by peril of the sea, and entitles assured to recover. *Park*, 61. 1 Show. 525. 2 Rolle's Abr. 248. p. 10. Camb. 56.

Mistake of captain in missing a port, not deemed a loss by peril of the sea. *Gregson v. Gilbert*, Pasch. 23 Geo. 3. *Park*, 63.

A ship never heard of after her departure, presumed to be lost at sea. *Green v. Brown*, 3 Stra. 1199. *Newby v. Read*, Sittings after Mich. 3 Geo. 3.

Usage in respect of time for presumption of loss. *Salk.* 22.

In case of adjustment of such supposed loss, that the ship afterwards arrives, the underwriter may recover back the money paid by him. *Park*, 64.

Ship destroyed by species of worms, not a loss by peril of sea. *Rohl. v. Parr*, Guildhall Sitt. after Hil. 1796.

Where a ship arrived in port a mere wreck, and in attempting to remove her, sunk, although cargo saved and sold to a profitable market, assured recovered. *Shaw v. Felton*, 2 East, 109.

A ship under repair on a beach within tide away, bilged and damaged, is not a loss by perils of the sea. *Thompson v. Whitmore*, 5 Taunt. Rep. 227.

PARTIAL LOSS.

Mode by which partial loss may be adjusted. *Lewis v. Rucker*, 2 Burr. 1167, et seq. *Johnson v. Shedden*, 2 East, 581.

Proportion to be paid by underwriter. *Ib.* General rules as to partial loss. *Ibid.*

Meaning of partial loss when applied to the ship. *Park*, 101. 3.

Ditto when to the cargo. 2 Burr. 1167.

Such loss does not fall on the underwriter under 3l. per cent. *Park*, 101. 3.

When goods are partially damaged, underwriter must pay according to prime cost, or value in policy, or invoice price. 2 *Burr*. 1167.

No regard to be paid to rise or fall of market, nor any regard to be paid to difference of exchange. See *Thellusson v. Bewick*, *Sitt. after Mich.* 34 *Geo.* 3. *Espinasse*, p. 77.

Rule to be adopted where there is property of various kinds. *Park*, 111.

Underwriters not answerable for partial loss to "corn, fish, salt, fruit, flour, or seed, &c." unless ship stranded. *Catillon v. The London Assurance Company*, 3 *Burr*. 1553.

Decision of courts with regard to partial loss on "corn, fruit, &c." *Mason v. Skurray*, *Sittings after Hil.* 1780. *Wilson v. Smith*, 3 *Burr*, 1550. *Cocking v. Fraser*, B. R. East, 25 *Geo.* 3. *Burnet v. Kensington*, 7 *T. R.* 210. *Dobson v. Bolton*, *See ante*, II. 5. p. 69. *Byfield v. Brown*, 2 *Stra.* 1065. *Cantillon v. The London Assurance Company*, cited in 3 *Burr*. 1553. in *Wilson v. Smith*, and 2 *Mag.* 385. 7 *Term Rep.* 216. in n.

Where there is a *bona fide* stranding, goods excepted in memorandum are subject to partial loss. *Page v. Thompson*, *ante*, II. 5.

MISREPRESENTATION. See FRAUD.

NEUTRALITY.

If warranty of neutrality be not complied with, contract void *ab initio*. *Park*, c. 10. *Skin.* 327. 3 *Burr*. 1419. 1 *Black. Rep.* 427.

If ship neutral at commencement of risk, insurer takes upon him chance of peace, or war. *Doug.* 752. *Eden v. Parkinson*.

Condemnation of ship on ground of infraction of treaty, in not being properly documented, conclusive against warranty of neutrality. *Daring v. Royal Exchange Assurance Company*, 5 *East*, 99.

Warrant of neutrality not falsified by sentence of foreign court. *Pollard v. Bell*, 8 *Term Rep.* 454.

Condemnation of goods warranted American, though in a ship hired and loaded at London, and destined for the English islands, not conclusive evidence against warranty of neutrality. *Calvert v. Bovill*, 7 *T. Rep.* 523.

Condemnation of ship warranted American, for want of role d'equipage or list of crew, conclusive against warranty of neutrality, though really American. *Geyer v. Aguilar*, 7 *T. Rep.* 681.

Warranty of neutrality disproved, by master's forcibly rescuing ship to avoid search. *Garrels v. Kensington*, *ibid.* 230. (*see ante*).

PAROL EVIDENCE.

Where it may reasonably be admitted. *Nesbitt v. Kensington*, 4 *T. Rep.* 783.

PARTIAL LOSS. See *tit. LOSS*.

PERIL OF THE SEA. See *tit. LOSS*.

POLICY,

Its nature. 2 *B.* 1117.

Different kinds. 1 *Ven.* 317. *Motteux v. Lond. Ass. Co.* 1 *Atk.* 545. *Bates v. Graham*, *Salk.* 444.

For detention of which trover lies. *Park*, 4. Name of person insured. See *Cox and another, Executors, v. Parry*, 1 *T. Rep.* in which it was held that the executors could not recover, because, amongst other grounds, the name of their testator was not inserted in the policy.

Name of person insured. 3 *Burr.* 155. *Park*, 19.

Name of ship and master. *Kewley and another v. Ryan*, 2 *H. B. Rep.* p. 343. on ship or ships, and *Henchman v. Offley*, *ib.* 345, note (a); and see *Marshal* on ship or ships.

What is considered a sufficient name. *Le Mesurier and another v. Vaughan*, 6 *East*, 382.

Name of shipping port. *Moll. b.* 2. c. 7. s. 14.

Name of port of destination. *Park*, 22.

Time when risk commences and when it ends. On the goods it usually begins from the lading on board the ship, and continues till they are safely on board the ship; from her beginning to lade at A. and continues till she arrive at the port of destination, and be there moored in safety 24 hours.

Time fixed for unloading, not fixed unless unreasonable delay. *Noble v. Kenoway*, *Dougl.* 492.

Stamp on policy. 44 *Geo.* 3. c. 98. See also 35 *Geo.* 3. c. 63. s. 1 to 16

Whether policy made on ship, goods, or merchandise. The only material difference between the memorandum of private underwriters, and those of the two insurance companies, consists in the omission of the words "or the ship being stranded," and that they insert *rum* among the articles upon which they will not be liable to any partial loss under 5 per cent. and omit freight out of the articles upon which there shall be no partial loss under 3 per cent. Vide the forms of the different policies in the schedule to the 35 *Geo.* 3. c. 63.

Perils must be stated against which the underwriter insures. 5 *Burr.* 2083.

Premium or consideration. *Airy and others, assignees of Milton v. Bland*, *Park*, 6th *Edit.* 27.

Exceptions in policy to perishable goods. See schedule to the 35 *Geo.* 3. c. 63.

"On ship and outfit" cannot be altered to "ships and goods" after ship sails. *Hill v. Patten*, 8 *East.* 373.

Construction of,

On ship, generally, construed to mean till ship was unladen. *Skin.* 243.

But if the usual words "till moored 24 hours in safety," insurers not answerable unless loss happen within that time. *Lackyer and others v. Offley*, 1 *Term Rep.* 252.

Where ship arrived at wharf 12th January, but could not unload, being on outside

tier, with anchors out, &c. and so continued till the 19th, when some ice forced her adrift, and she was lost, held to be completely moored on the 12th. *Montgomery v. Egginton*, 3 Term Rep. 362.

On insurance "at and from" any place, ship is protected from her first arrival, &c. 1 Atk. 548. *Chitty v. Selvin*, 2 Atk. 539. *Camden v. Cowley*, 1 Black. Rep. 417. *Barras v. Lond. Ass. Co. Sittings after Hil. 1782*, at Guildhall, which doctrine was confirmed by a modern decision, *Leigh v. Mather*, Park, 38.

On policy from London to Madras and China, with liberty to touch, stay, and trade at any ports, &c. On ship's arrival at Madras she was employed to fetch rice from Bengal, and in second voyage was lost; insured may recover. *Gregory v. Christie*, B. R. Trin. 24 Geo. 3. *Farquharson v. Hunter*, B. R. Hil. 25 Geo. 3.

Parties made by their own agreement prevent latitude of construction. *Doug. 27. Eden v. Poole*, Sitt. after Hil. 1785. *Robertson v. Ewer*, 1 Term Rep. 127.

Loss must be a direct and immediate consequence, not a remote one. *Jones v. Schmoll*, 1 Term Rep. 150 n. (a) Policies must be construed by the same rule as other instruments, unless by usage of trade, &c. certain words have a peculiar sense, distinct from the ordinary and popular sense. *Robertson and another v. French*, 4 East. 130.

Assured cannot recover, unless ship is equipped with every thing necessary, and therefore cannot recover if no pilot on board. *Law v. Hollingworth*, 7 T. Rep. 160.

What is construed a sufficient covering. *Seller v. M^r Vicar*, 1 B. and P. New Rep. p. 23. *Robertson and another v. French*, 4 East. 130.

Policy on foreign ships must be understood to except captures made by authority of British government. *Kelner v. Le Mesurier*, 4 East. 396.

Where a mob seized a vessel with corn, and took it at their own price, and stranded her, assured could not recover as for a general average. N. B. There was no count for stranding. *Nesbitt v. Lushington*, 4 Term Rep. 783.

What is to be construed a commencement of the voyage. *Driscoll v. Passmore*, 1 Bos. and P. 200.

Ship arriving at a port where an embargo is previously laid, and the day after extended to her, cannot be construed to have been moored in safety 24 hours. *Minet v. Anderson*, Peak, 211. *Sittings after Hil. Term*, 34 Geo. 3.

Corn, deemed a general term, and includes pease, beans, and other species of pulse. *M^r Andrews v. Vaughan*, Sitt. after Hil. Term, 1793. *Mason v. Skurray*, Sitt. after Hil. 1780, at Guildhall. Rice is not corn, *Scott v. Bourdillon*, 2 N. R. 213.

Construction to be put on the words unless stranded. *Bowring v. Elmstie*, Sitt. after Trin. 1790.

PORT OF LONDON.

What is so considered. Park, c. 18.

PROCEEDINGS.

Mode of proceeding. 43 Eliz. c. 12. 13 & 14 Car. 2. c. 23. *Stra. 166. 1 Show. 396. 2 Sid. 121. Park's Intro. See De Ghetoff v. Lond. Ass. Co. 3 Bro. P. C. 525.*

Plaintiff, on request in writing, must (by 19 Geo. 2. c. 37. s. 6.) declare amount of all insurances on same ship. Park, c. 20.

Action against private underwriters *indebitatus assumpsit*, and may be brought in the broker's name. 3 Black. Com. 157.

The usual plea *non assumpsit*. *Ibid.*

Proofs necessary on trial. *Ibid.*

Consolidation. 1 Tidd. 557. *Perchard v. Whitmore*, 2 Bos. and P. 155. n. Page v. Fry, *ib.* 240.

Payment of money into court allowed by 19 Geo. 2. c. 37. s. 7.

In what case action for money had and received lies. 2 Barn. B. R. 103. 1 Tidd. 557. *Park's Intro.*

Declaration, requisites of. Park, c. 20.

Though declaration allege total loss, insured may recover for partial one. *Gardiner v. Crosedale*, 2 Burr. 904. 1 Black. Rep. 193.

Declaration on policy for foreign ship need not aver any interest in assured. *Nantes v. Thompson*, 2 East. 385.

Averment of interest relates to time of making policy. *Perchard v. Whitmore*, 2 Bos. and P. 155. n.

Where averment is good. *Page v. Fry*, *ibid.* 240. *Wolff and others v. Horncastle*, 1 Bos. and P. 516.

Where Dutch commissioners had an insurable interest in Dutch ships. *Craufurd v. Lucena*, Park, 406. n. (a) *Craufurd v. Hunter*, (*vide ante.*)

Expenses of salvage not necessary in declaration as special breach of policy. *Hardw.* 304.

Expenses of depositions taken abroad not allowed in taxation. *Taylor v. Roy. Ex. Ass. Co.* 8 East. 393.

Protest of captain delivered by broker to defendant, will not enable defendant to read it as evidence on his part. *Senat v. Porter*, 7 T. R. 158.

Of producing instruments at trial. *Gordon and others v. Secretan*, 8 East. 548.

Contribution of average may be recovered by a suit in equity or action at law. *Shepherd and others v. Wright*, *Show. Parl. Cas.* 18.

Insured cannot recover unless they make a full disclosure of circumstances. *Stewart v. Dunlop in Dom. Proc.* 1785. *Fitzherbert v. Mather*, 1 T. R. 12. Park, c. 10.

If ship be insured at and from A. to B. and there be any illegality in the transaction during her stay at A. assured cannot recover

for loss happening between A. and B.
Bird v. Appleton, 8 T. R. 562.

PROHIBITED GOODS.

Insurance made to protect importation or exportation of prohibited commodities are void. 4 & 5 W. & M. c. 15. sec. 14, 15, 16. and 8 & 9 W. 3. c. 36. sec. 1. *Mir.* c. 1. sec. 3. 11 Ed. 3. c. 1. & 8 Eliz. c. 3. 12 Car. 2. c. 32. 7 & 8 W. 3. c. 28. 4 Geo. 1. c. 11. 12 Geo. 2. c. 21. s. 29. and sec. 33. 28 Geo. 3. c. 33. sec. 45, 46, 48. *Park*, 255.

What are deemed contraband or prohibited goods, see *Annesley*, p. 127. Penalty of 500*l.* on persons insuring to import prohibited goods by 4 & 5 W. & M. c. 15. s. 14, &c. and 8 & 9 W. 3. c. 36. s. 1.

QUARANTINE.

Ship ordered to perform quarantine after arrival at her moorings, but before she remained 24 hours, renders underwriter liable. *Waples v. Eames*, 2 Stra. 1243.

RE-ASSURANCE.

Action not maintainable for premiums on re-assurance. *Edgar and another, assignees of Carden v. Fowler*, 3 East. 222.

19 Geo. 2. c. 37. s. 4. renders re-assurance unlawful, unless underwriter should be insolvent, become bankrupt, or die.

Assured must state in policy it is a re-assurance. *Andre v. Fletcher*, 2 T. R. 161.

Usage of other countries in respect of re-assurance. *Annesley on Insurance*, p. 63.

RECAPTURE, see TIT. CAPTURE.

RESPONDENTIA, see TIT. BOTTOMRY.

RETURN OF PREMIUM.

If ship arrive before policy is made, and underwriter is acquainted therewith, but insured is not, the latter is entitled to return of premium. *Loccenius de Jure Marit.* 2. c. 5. sec. 8. 1 Mag. 90.

But if both parties be ignorant of the arrival, and the policy (as usual) is lost or not lost, underwriter should retain. *Dougl.* 268.

Clauses inserted in policy, stating that upon a certain event premium shall be returned, have a binding operation. *Ibid.*

If no risk run, consideration for premiums fails. 1 *Vesey*, 319.

In a policy where there was a clause that *sl.* per cent. should be returned if ship sailed from the West India Islands with convoy, and arrived, held that arrival of ship, whether with or without convoy, entitled party to a return of premium. *Symond and another v. Boydell, Dougl.* 225. *Audley v. Duff*, 2 Bos. & Pull. 111.

Policy made here for a Russian house in ignorance of hostilities between the two countries, void in its inception, but agent of insurer entitled to return of premium. *Oom v. Bruce*, 12 E. R. 225.

SAILING, Time of.

May be extended without a new stamp
35 Geo. 3. c. 65. s. 13.

SALVAGE.

Definition. *Beaves Lex Merc.* 146. *Park*, 151. 1 *Ld. Raym.* 393. 2 *Salk.* 654.

Propriety of it. *Kaim's Princ. of Eq. Introd.* p. 6. *Leg. Rhod.* S. 2. art. 45, 46, 47. 13 Geo. 2. c. 4. s. 18. 29 Geo. 2. c. 54. s. 24. See 43 Geo. 3. c. 160. s. 39. and 45 Geo. 3. c. 72. s. 7. *Abbot*, part III. ch. x. 356. Case of the *Aquila*, 1 Rob. A. R. 37. *Wellwood's Sea Laws*, tit. 24. *Vrow Margaretha, Jacobs*, 4 Rob. A. R. 103.

Expenses of salvage not necessary in declaration as special breach of policy. *Hard.* 304.

On payment of salvage, right of original owner preserved to him for ever. 2 *Burr.* 694. 29 Geo. 2. c. 34. See 43 Geo. 3. c. 160. s. 39. and 45 Geo. 3. c. 72. s. 7.

In case of wreck or desertion at sea, no positive rate of salvage fixed. *Abbot*, part III. ch. x. 356.

Passenger not entitled to claim salvage.

But in case where master deserted vessel, and took part of the crew, a person on board as passenger, at the request of remaining crew, took the command and brought her into port in safety, held to be entitled to salvage. *Newman v. Walters*, 3 Bos. & Pull. 612.

Payment of salvage regulated by 12 *Anne*, stat. 2. c. 18. 4 Geo. 1. c. 12. 26 Geo. 2. c. 19. 48 Geo. 3. c. 130. 49 Geo. 3. c. 122.

Case where captain paying salvors, on his own application, constituted himself agent of the owners. *Sir F. Baring v. Day*, (in *Trover*), 8 East, 57.

Wearing apparel of master and seamen always exempt from salvage. *Park*, 140. Expenses of salvage borne by underwriters. *Hardw.* 304. Where salvage is high, insured may abandon. *Annesley*, p. 95.

SEA-WORTHINESS.

Determination in respect of. *Park*, c. 11.

If ship not sea-worthy at time of insurance, there is no contract at all. See *Park*, c. 11. 4 East. 590. But if she becomes otherwise one hour after the risk has attached, it is sufficient to charge the underwriter. 1 *Dow.* 344. *Scotch.*

If information as to sea-worthiness be called for, assured must disclose truly what he knows. 4 East. 590. As to tackling. *Wilkin v. Geddes*. 3 *Dow.* 57. *Scotch.*

SHIP

Need not be documented as belonging to any particular country, and if captured, owner of goods may recover. *Dawson v. Atty.* 7 East. 367.

Ship arriving at a port where an embargo is previously laid, and the day after extended to her, cannot be said to have been moored in safety 24 hours. *Minet v. Anderson, Peake*, 211. *Sit. after Hil.* 34 Geo. 3.

If ship does not carry her freight, insured cannot recover. *Seller v. M'Vicar* 1 B. & P. New. Rep. 23.

STRANDING.

Custom of companies and underwriters in London as to stranding. See *Annesley*, p. 79. *Cantillon v. Lond. Ass. Co.* cited in 3 Burr. 1553.

Companies have left out words "or the ship be stranded," and are only liable in case of general average. *Ibid.*

On insurance upon fruit, and policy contain usual memorandum "corn, fruit, &c." and the ship be in fact stranded, underwriters liable for average loss. *Burnet v. Kensington*, 7 T. R. 210.

Where there is bonâ fide stranding, goods excepted in memorandum, are subject to partial loss. *Ibid.* and *Page v. Thompson*, at *Guildhall*, Sitt. after Trin. T. 1805, in M. S.

Ship running on some wooden piles to keep up shore, and remaining there till they were cut away, deemed stranded. *Dobson v. Bolton*, Sitt. after East. T. Park, 4. edit. 3, 4.

Ship laden with corn, striking on sand bank in the river Thames, plaintiff recovered for average loss. *Page v. Thompson*, *Guildhall*, Sitt. after Tr. T. 1805, in M. S.

Construction to put on the words unless stranded. *Bowring v. Elmslie*, Sitt. after Trin. 1790. Park, 115.

UNDERWRITER

Liable if ship not moored 24 hours. *Skinn*. 243. *Lockyer and others v. Offley*, 1 T. R. 252.

Underwriter presumed to be acquainted with practice of trade he insures. *Tierney v. Etherington*, and *Pelley v. Royal Ex. Co.* 1 Burr. 348.

Not liable for sailors' wages and provisions while ship detained to refit. *Robertson v. Ewer*, 1 T. R. 127.

Liable if goods damaged in lighter without negligence. *Hurry v. Royal Ex. Co.*, 2 Band. P. 430. *Rucker v. same*, *ibid.* 432. n.

Unforeseen separation from convoy renders underwriter liable. 3 Lev. 320. 2 Salk. 443. *Carth*. 216. 1 Show. 320. 4 Mod. 588. c. *Victoria v. Cleeve*, 2 Stra. 1250.

Provisions as to the underwriter becoming bankrupt, 19 Geo. 2. c. 37. s. 4.

Underwriter not liable for partial loss on corn, fish, &c. Cited in 3 Burr. 1553, in *Wilson v. Smith*, and 2 Mag. 385. 7 T. R. 216. in n.

On French property in time of peace not liable for loss by capture, by king's ships during hostilities, though they terminate prior to action. *Gamba and another v. Le Messurier*, 4 East. 407.

UNLOADING.

Where ship in unloading her cargo occupied many days in fishing, and was captured, insurer liable by usage of trade. *Noble and others v. Kennoway*, Dougl. 472.

Where ship arrive at wharf 12th January, but could not unload, being on the outside tier, with anchors out, &c. and continued so till the 19th, when some ice forced her

adrift, and she was lost, held to be completely moored on the 12th. *Montgomery v. Egginton*, 8 T. R. 362.

VALUED POLICY,

Is not a wager policy. *Lewis v. Rucker*, 2 Burr. 1167.

In case of valued policy, assured must recover whole sum, because he could not have any claim for return of premium for short interest of ship arrived safe. *Ibid.*

On a policy on ship and goods valued at so much, on a voyage to Africa and the West Indies, insured are entitled to recover on a total loss which happened in the latest period of the voyage. *Shaw v. Felton*, 2 East. 100. 109.

WAGER POLICY.

Wager policies originally bad. *Park*, c. 14. *Assevedo v. Cambridge*, 10 Mod. 77. *Depaiba v. Ludlow*, Com. Rep. 360. *Goddart v. Garret*, 2 Vern. *Le Pyre v. Farr*, *ibid.* 716. Distinction between interest and wager policies. *Goss and another v. Withers*, 2 Burr. 683.

Wager policy, and those interest or no interest, prohibited by 19 Geo. 2. c. 37. s. 1.

Proviso in favour of private ships of war, sec. 2.

WARRANTY.

What is considered as such. 1 T. Rep. 345. *Park*, 518. *Blackhurst v. Cockell*, 3 T. R. 360. 1 T. R. 346. *Cowp*. 607.

Difference between warranty and representation. *Pawson v. Watson*, *Cowp*. 787. *Park*, 214. *Roccus*, Not. 51, 78. *Middlewood v. Blakes*, 7 T. Rep. 162.

Various kinds of warranties. *Hore v. Whitmore*, *Cowp*. 784. *Vexian v. Grant*, cor. *Buller J. East. Vac.* 1779.

If ship be warranted to sail on particular day, and do not, underwriter is not answerable. *Ibid.*

Detention of governments no excuse for breach of warranty. *Ibid.*

Ship touching at place of rendezvous for convoy, though detained there by an embargo, has complied with warranty. *Bond v. Nutt*, *Cowp*. 601. *Thelluson v. Ferguson*, Dougl. 361.

If ship warranted to sail with convoy, and do not, underwriter not responsible. *Park*, c. 18.

Warranty to sail with convoy understood, to mean throughout voyage. 2 Salk. 445. *Gordon v. Morley*, 2 Stra. 1265. *Jeffrey v. Logendra*, 5 Lev. 320. *Lilly v. Ewer*, Dougl. 72.

Where ship is prevented from joining convoy by tempestuous weather, yet endeavours to do so, deemed a satisfaction of warranty to sail with convoy. *Victoria v. Cleeve*, 2 Stra. 1250.

If warranty of neutrality be not complied with, contract void *ab initio*. 4 Barr. 1419. 1 Black. Rep. 427. *Barber v. Fletcher*, Dougl. (292) 305. Dougl. 732. *Eden v. Parkinson*.

Sailing orders necessary to performance of warranty to depart with convoy, unless particular circumstances exempt insured from general rule. *Webb v. Thompson*, 1 Bos. and Pull. 5. *Anderson v. Pitcher*, 2 B. and P. 165.

Warranty that a ship is American property, means that she is entitled to privileges of the American flag, and if she has no passport, it is not complied with. *Rich v. Parker*, 7 T. Rep. 705.

Such passport must express place of habitation of commander by art. 25. of treaty between America and France. *Baring v. Christie*, 5 East. 398.

On a warranty with convoy from Hull to Bilbao, voyage from Hull to Portsmouth, and thence to Bilbao, considered distinct. *Rothwell v. Cooke*, 1 Bos. and Pull. 172.

Warranty of neutrality not falsified by sentence of foreign court. *Follard v. Bell*, 8 T. Rep. 434.

Ship condemned on ground of infraction of treaty in not being properly documented, &c. conclusive against warranty of neutrality. *Baring v. The Roy. Ex. Ass. Co.* 5 East. 99.

Condemnation of goods warranted American, though in a ship hired and loaded at London, and destined for the English islands, not conclusive evidence against warranty of neutrality. *Calvert v. Bovill*, 7 Term Rep. 523.

Ship warranted American condemned for want of *role d'équipage*, or list of crew, conclusive against warranty of neutrality, though really American. *Geyer v. Aguilar*, 7 T. Rep. 681.

Warranty of neutrality disproved by master's forcibly rescuing ship to avoid search. *Garrels v. Kensington*, 7 T. Rep. 250.

For forfeiture of neutrality by act of assured or master, after commencement of voyage, a breach of warranty. *Garrels v. Kensington*, 7 Term Rep. 250.

A ship licensed to sail without convoy, provided she be armed with a certain force, must take that force on board before she break ground. *Hinkley v. Walton*, 3 Taunt. 151.

A licence to Gibraltar did not legalise a voyage to Palermo and Malta, touching at Gibraltar, but finding there neither licence nor convoy. *Ingham v. Agnew*, 15 E. R. 517. 4 Taunt. 178. See further SHIP-PING.

INSUPER, is used by auditors in their accounts in the exchequer; as when so much is charged upon a person as due on his account, they say so much remains insuper to such an accountant.

INSURANCE-BROKERS, are persons who frequent Lloyd's coffee-house over the Royal-Exchange, London; they fill up the policies of insurance, to which they procure the signatures of the insurers or underwriters; they charge the merchant or ship-owner who employs them, a commis-

sion (from $\frac{1}{2}$ to $\frac{1}{3}$ per cent.) for effecting the insurance, and likewise receive a gratuity of 10 per cent. from the underwriter on the annual balance which may be in favour of the underwriter, exclusive of an allowance of 5 per cent. made to them on the premiums at the time of effecting the insurance; as for instance, if the premium of insurance be 10 guineas per cent. the insurance-broker only gives credit to the underwriter for 10l. per cent. and carries the difference to the credit of his commission account, or that of profit and loss.

INTAGLIO, an Italian word, signifying any thing that has figures engraved on it, so as to rise above the ground. It is usually applied to gems. The French used to be celebrated above all other people for manufacturing these, and other, trinkets, but the English now rival them.

INTENT, or INTENTION. The words of deeds shall be construed according to the intent of the parties, and not otherwise; but the intent shall be destroyed where it does not agree with the law. *Pl. C.* 160. *b.* 162. *b.*

INTEREST. In legal understanding an interest extends to estates, rights, and titles, that a man hath in, or out of lands, so as by grant of his whole interest in such land, a reversion therein, as well as possession in fee-simple, shall pass. *Co. Lit.* 345.

INTEREST on Bankrupts' Debts. The usual rule is, that all interest on debts carrying interest shall cease from the time of issuing the commission. *Atk.* 244. Yet, in case of a surplus left after payment of every debt, such interest shall again revive, and be chargeable on the bankrupt, or his representatives. 1 *Atk.* 244.

And in case of a surplus, the chancellor will not order it to be returned to the bankrupt till he has discharged the interest up to the time on all debts bearing interest, and satisfied all other equitable claims upon the fund. 2 *Ves. Jun.* 303.

Bills and notes in which interest is not named, carry interest only between the protest and the date of the commission. 2 *Black. N.* by *Chris.* 488.

INTEREST of money, is a sum paid or allowed for the loan or use of some other sum lent for a certain time, according to some fixed rate or proportion. The sum lent, on which the interest is reckoned, is called the principal; and in any case where there is hazard of the loss or diminution of the principal, a proportionately greater interest is usually paid. The current rate of interest is generally considered as the barometer of public credit; and its lowness is a sign almost infallible of the flourishing condition of a state; it proves the increase of industry, and the free circulation of wealth, little inferior to a demonstration. In order to prevent individuals from taking unjust advantages of the necessities of

others, it has been found necessary, in most countries, to establish by law a fixed rate of interest for the use of money; this however must, in a great measure, depend on the current rate of interest in the country; for if it is attempted to reduce by law the common rate of interest below the lowest ordinary market rate, the restriction will be sure to be evaded. This was the case in France in 1766, when, although the legal rate of interest was reduced from five to four per cent. money continued to be lent at five per cent.

The first act of parliament for regulating the interest for money lent in England was 37 Hen. 8. c. 9. by which interest was fixed at 10 per cent.; before that time interest had usually been taken at higher rates. In 1552 an act was passed against usury, or taking any interest whatever for money lent: the impolicy and oppression of this measure soon became evident; and in 1571, the statute of Henry VIII. which fixed interest at 10 per cent. was revived. As the increase of commerce brought wealth into the country, the rate of interest lowered; and in 1625 it was, by 21 James 1. c. 17, reduced to eight per cent. The first positive law made in Scotland for fixing the rate of interest was in 1587, when an act was passed, by which the rate of interest was not for the future to exceed 10 per cent. In France, in 1601, Henry IV. issued an edict for reducing the public or national interest of money in that kingdom to six and a quarter per cent. In 1651, the interest of money in several parts beyond sea being lower than the legal interest in England, the Rump-parliament reduced the legal rate from eight to six per cent.; and upon the Restoration it was confirmed by 12 Cha. 2. c. 13. The last act of parliament for regulating the interest of money was 12 Anne, st. 2. c. 16. by which it was fixed at five per cent. per annum, the present legal rate. But although this is the utmost interest which can be taken for money lent in Great Britain, yet if a contract which carries interest was made in a foreign country, our courts will direct the payment of interest according to the laws of the country in which the contract was made: thus American, Turkish, and Indian interest have been allowed, to the amount of even 12 per cent. 2 *Black. Com.* 463.

The various rates which have been paid in Great Britain at different periods, as the current interest for money, are as follow:

Per cent. per ann.

In 1255	-	£50 0 0
1263, 2d. a week for 1l. or	45 6 8	
1270 to 1307	-	45 0 0
1422 to 1470	-	15 0 0
1545 restricted to	10 0 0	
1553 to 1558	-	12 0 0
1571 restricted to	10 0 0	
1524 to 1604, about	9 16 0	

	<i>Per cent. per ann.</i>
1625 reduced to	- 8 0 0
1645 to 1660	- 6 0 0
1660 reduced to	- 6 0 0
1660 to 1690	- 7 6 6
1690 to 1697	- 7 10 0
1697 to 1706	- 6 0 0
1714 reduced to	- 5 0 0

In the United States of America, the lawful interest of money is 6 per cent. in most of the States; in a few it is 7 per cent.; in one it is 5 per cent. In Greece, the mean rate of interest is 20 per cent. and in the other parts of Turkey nearly the same; in Persia 25 per cent.; and in the Mogul Empire 30 per cent. In these countries there is no fixed rate of interest, and the usual high rate arises chiefly from the insecurity of lending. In Sydney and the other English settlements in New South Wales, the rate of interest is fixed by an ordinance, dated 14th June, 1804, at 8 per cent. per annum.

Interest is distinguished into *Simple* and *Compound*.

INTEREST, *Simple*, is that which is reckoned on the principal only, at a certain rate for a year, and at a proportionally greater or less sum for a greater or less time; thus, if 5l. is the rate of interest of 100l. for a year, 10l. is the interest for two years, 15l. for three years, &c. In most computations of interest the work is much shortened if the interest of 1l. for a given term is known, as the interest of any other sum for the same term will then be found by only multiplying by the given sum. The interest of 1l. for a year must be in the same proportion as the interest of 100l. to its principal; therefore, at 5 per cent. as 100 : 5 :: 1 : $\frac{5}{100} = .05$; and thus:—

The interest of one pound for one year,

l.	l.
at 3 per cent. is	-.03
3½	-.035
4	-.04
4½	-.045
5	-.05
5½	-.055
6	-.06

The Interest of One Pound for any Number of Years.

Yrs.	3 per Cent.	3½ per Cent.	4 per Cent.	4½ per Cent.	5 per Cent.
10	.3	.35	.4	.45	.5
20	.6	.7	.8	.9	1.0
30	.9	1.05	1.2	1.35	1.5
40	1.2	1.4	1.4	1.8	2.0
50	1.5	1.75	2.0	2.25	2.5
60	1.8	2.1	2.4	2.7	3.0
70	2.1	2.45	2.8	3.15	3.5
80	2.4	2.8	3.2	3.6	4.0
90	2.7	3.15	3.6	4.05	4.5
100	3.0	3.5	4.0	4.5	5.0

Although the law forbids any person lending money to take more than 5*l.* for the interest of 100*l.* for a year; yet, by allowing the proportionate part of 5*l.* to be taken for part of a year, it permits any one who lends money for a less term than a year, to receive more than he ought if he were to make only 5 per cent. per annum of his money; for, if he lends 100*l.* for six months, he receives 10*l.* 10*s.*, and this being lent again for the remaining six months, amounts to 10*l.* 1*s.* 3*d.* if the time is less than six months the difference must be still greater. The letter of the law is however the rule in practice, and therefore the 365th part of the yearly interest is always considered as the proper interest for a day, and its multiples as the interest for any number of days.

The Interest of One Pound for One Day,

£		£
At 3 per cent. is	-	.00008219
3½	-	.00009589
4	-	.00010959
4½	-	.00012329
5	-	.00013699
5½	-	.00015068
6	-	.00016438

As tables of Simple Interest are chiefly referred to, in order to find the interest or discount on bills of exchange, and as by far the greater number of bills which are discounted have less than 100 days to run, the following table will answer most useful purposes; but those who have constant occasion to make such computations, on a more extensive scale, must seek assistance from the various tables which have been computed in various works published specially for the purpose. See also DISCOUNT.

TABLE

Showing the Simple Interest of One Pound, for any Number of Days, not exceeding 100, at 5 per cent.

Days.	Amount.	Days.	Amount.

63	.0086301	98	.0134246
64	.0087671	99	.0135616
65	.0089041	100	.0136986

The interest of any sum for any number of days contained in the table, is found by only multiplying the figures corresponding with the number of days by the sum: thus, if the interest of 150*l.* for 61 days is required, the interest of one pound for 61 days is, by the table, .0083561, which multiplied by 150, gives 1*l.* 5*s.* 0¾*d.* If the given sum contains shillings and pence, they must be reduced to the decimal of a pound. The interest for any greater number of days than are contained in the table, is easily found by means of it: thus, if it is required to find the interest of 100*l.* for 165 days, the interest for 100 days by the table is 1.36986, and for 65 days .89041, which two sums added together, make 2.26027, or 2*l.* 5*s.* 2*d.* But, although it is most convenient in common practice to make use of tables for finding the interest for days, the interest of any sum for any number of days may be correctly and expeditiously obtained without the use of any table, by the following rule: "Multiply the given sum by the number of days, and divide by 7300."

Example 1. What is the interest of 356*l.* for 112 days?

356 multiplied by 112, and divided by 7300, gives 5.4619, or 5*l.* 9*s.* 2 $\frac{3}{4}$ *d.*

Example 2. What is the interest of 137*l.* 18*s.* for 97 days?

137.9 multiplied by 97, and divided by 7300, gives 1.8523, or 1*l.* 16*s.* 7 $\frac{1}{2}$ *d.*

The amount of a given sum in any time may be found by multiplying the principal, time, and rate together; and adding the product to the principal.

Example 1. What sum will 37*l.* 10*s.* amount to in 3 years and 146 days, at 4 per cent. per annum?

37.5 multiplied by 3.4, and the product multiplied by .04, gives 5.1; which added to 37.5, makes 42.6, or 42*l.* 12*s.*

Example 2. What sum will one penny amount to in 1806 years, at 5 per cent. per annum?

.004166 multiplied by 1806, and the product multiplied by .05, gives .37625, which, added to the principal, makes .380416, or 7*s.* 7 $\frac{1}{2}$ *d.*

This example sets the difference between simple and compound interest in a most striking point of view; it appears that one penny put out to interest, at the birth of Christ, would (at 5 per cent. simple interest) have amounted at the present time to 7*s.* 7 $\frac{1}{2}$ *d.* but at compound interest, it would have increased in the same period to a greater sum than would be contained in six hundred millions of globes, each equal to the earth in magnitude, and all solid gold.

INTEREST, *Compound*, is that which is reckoned on the principal and its interest put together, as the interest becomes due, so as to form a new capital from each period at which the interest is payable: it is sometimes called interest upon interest. It is not lawful to lend money at compound interest; but in the granting or purchasing of annuities, leases or reversions, it is usual to allow the purchaser compound interest for his money; and the difference from simple interest is so great, in all cases in which the period of time is considerable, that almost all computations relating to annual payments of money for a number of years, are made at compound interest, unless it is otherwise agreed.

Let r = the amount of 1*l.* in one year, viz. principal and interest,

n = the number of years in which

p = the principal increases to

a = the amount:

then 1: r : : r : r^2 the amount of 1*l.* in 2 years

1: r : : r^2 : r^3 the amount of 1*l.* in 3 years

1: r : : r^3 : r^4 the amount of 1*l.* in 4 years

&c.

therefore r^n , or r raised to the power whose exponent is the number of years, will be the amount of 1*l.* in those years; and as

1*l.*: r^n : : p : a the amount of a given principal in the same time. Thus,

If Principal, Time, and Rate, are given, to find the Amount?

$$\text{Theo. 1. } p \times r^n = a.$$

If Amount, Time, and Rate, are given, to find the Principal?

$$\text{Theo. 2. } \frac{a}{r^n} = p.$$

If Principal, Amount, and Time, are given, to find the Rate?

$$\text{Theo. 3. } \sqrt[n]{\frac{a}{p}} = r.$$

If Principal, Amount, and Rate, are given, to find the Time?

$$\text{Theo. 4. } \left\{ \begin{array}{l} \frac{a}{p} = r^n, \text{ therefore } \frac{a}{p} \\ \text{being divided by } r \text{ till no-} \\ \text{thing remains, the num-} \\ \text{ber of divisions will} = n. \end{array} \right.$$

But for greater convenience in practice, these theorems may be expressed in logarithms, as follow:

$$1. \log. p + n \times \log. r = \log. a.$$

$$2. \log. a - n \times \log. r = \log. p.$$

$$3. \frac{\log. a - \log. p}{n} = \log. r.$$

$$4. \frac{\log. a - \log. p}{\log. r} = n.$$

On these principles all tables of Compound Interest are formed, of which the following are the most useful.

TABLE I.

Shewing the Sum to which 1*l.* Principal will increase at 5 per cent. Compound Interest, in any number of years not exceeding a hundred.

Years.	Amount.	Years.	Amount.
1	1.05	15	2.078928

In order to find what any sum will amount to in a given number of years, it is only necessary to multiply the number in the table opposite to the term of years by the sum, and the product will be the answer.

Example. To what sum will 50*l.* increase in 69 years, at 5 per cent. compound interest?

The number in the table corresponding with 69 years is 28.977548, which multiplied by 50, gives 1448.8774, or 1448*l.* 17*s.* 6*d.*

The number of years in which a given sum will increase to another given sum in consequence of being improved at interest, is found by dividing the latter sum by the former, and the sum in the table which is nearest to the quotient will show the term required.

Example. In what time will 100*l.* increase to 500*l.* if improved at 5 per cent.?

Divide 500 by 100, and the number in the table nearest to 5 the quotient, is 5 003188, which shows that 33 years is the answer.

TABLE II.

Showing the present value of 1*l.* to be received at the end of any number of years, not exceeding 100: discounting at 5 per cent. Compound Interest.

In order to find the present worth of any sum which is to be received at the end of a certain number of years, multiply the number in the table opposite to the term of years by the sum, and the product will be the answer.

Example. What is the present value of 500*l.* to be received at the expiration of 14 years?

The number in the table corresponding with 14 years, is .505068, which multiplied by 500, gives 252.534, or 252*l.* 10*s.* 8*d.*

For the present value or amount of annual payments, as Annuities, Pensions, Leases, &c. at Compound Interest, see ANNUITIES.

INVENTORY, is a catalogue or particular enumeration of goods, debts, and effects.

Executors and administrators, in conjunction with at least two debtors or legatees, or, in their absence, any two other persons

next of kin, or other honest persons, shall make a true inventory of all the goods, whether moveable or immoveable, belonging to the deceased; such inventory is to be copied, whereof one part shall be taken before the bishop, and delivered to him, by the executors and administrators, upon oath, and the other shall remain with the executors.

In a distress for rent, an inventory also is to be made of the goods distrained, a copy

of which is to be delivered to the tenant, who not replevying within a certain time, the goods contained in such inventory are to be sold. *See* BROKER.

INVOICE, is an account of goods or merchandise shipped by merchants for their correspondents abroad, in which the peculiar marks of each package, with other particulars, are set forth. The usual forms of invoices are as follow :

INVOICE-BOOK, in merchants' accounts, the book in which the original invoices are entered. See **BOOK-KEEPING**.

JOBBER, is one who buys or sells cattle for others. See stat. 22 & 23 Car. 2.

JOBBER, *Stock*, one who trafficks in the public funds, by buying or selling stock when he finds it advantageous to his own interest so to do.

IODINE, an interesting simple substance, discovered by Courtois, a saltpetre manufacturer of Paris, in 1811. It may be obtained from a variety of sea weeds and funguses; and in great abundance, from *kelp*. It has been called Iodine (from *ios* and *idos*) from the beautiful violet colour it assumes when in a state of vapour. It is solid at the common temperature; of a bluish colour; its lustre is metallic. It is soft and friable; of specific gravity 4.946. its taste is acid. The crystals of iodine melt at 220°, and at a higher degree of heat are converted into violet-coloured fumes, which condense into brilliant plates, and acute octoëdrons. United with oxygen, it forms an acid, termed oxiodic acid, which acts rapidly on gold. Combined with chlorine, it forms crystals of a deep orange colour, which are very deliquescent, and easily fusible. With hydrogen, it forms an acid, termed hydriodic acid. It is slightly soluble in water, and highly so in ether and alcohol.

The compounds of iodine, with some of the metals, particularly mercury and lead, form very beautifully coloured compounds; which might be advantageously employed as pigments, and for calico printing.

JOINER. The business of a joiner is generally connected with that of a carpenter, he is employed in making gates, doors, laying floors, dividing the house into the several partitions, preparing the ceiling for the plasterer to nail on his laths, &c. &c.

JOINT COMMISSION. See **BANKRUPT**.

JOLLY-BOAT. See **BOAT**.

JONK, JONQUE, or JUNK, is a

kind of small ship, very common in the East Indies and China: these vessels are about the bigness of our fly-boats, and differ in the form of their building, according to the different methods of naval architecture used by the nations to which they belong. Their sails are frequently made of mats, and their anchors of wood.

JOURNAL, in merchants' accounts, a book into which every particular article is posted out of the waste-book. See **BOOK-KEEPING**.

JOURNAL, in sea affairs, a register kept on board ship, wherein notice is taken of every thing that happens to the ship from day to day, and from hour to hour, with regard to the winds, courses steered, leeway, soundings, &c. in order to adjust the reckoning and determine the place where the ship is.

JOURNEYMAN, is a person who wrought with another by the day, though now by the statute made 5 Eliz. c. 4. it is extended to those likewise, who covenant to work with another in his trade or occupation by the year. By stat. 21 Henry 8. c. 5. journeymen are not to be restrained by oath or bond from setting up their trade. See **tiles** **LABOURERS, MASTERS and SERVANTS, MANUFACTURERS, COMBINATIONS, and PIECE-WORK**.

IPECACUANHA, (GER. *Amerikanische brechwurzel*, DU. *Braakwortel*, Rooden-loopwortel. DA. *Brækrod*. SW. *Kräkrot*. FR. *Ipecacuanha*. IT. *Ipecocanna*. SP. *Ipecacuana*, Raiz de oro. PORT. *Cipo de camaras*, *Ipecacuanha*, Raiz de ouro. LAT. *Ipecacuanæ radix*.) a drug brought to us from South America, of which there are two sorts, Peruvian and Brazilian; the grey, or Peruvian, is that most esteemed, and of which we shall here take notice: it is a small wrinkled root, bent and contorted into different figures, brought over in short pieces, and deep circular fissures, quite down to a small white fibre or nerve, which runs into the middle of each piece. The cortical part is compact, brittle, and looks smooth and resinous upon breaking: it has very little smell, and a bitterish subacid taste.

The plant which yields *ipêcuanha* is usually found in the vicinity of Rio de Janeiro, in Brazil. It is of moderate height; some of the stalks generally creep along the ground; the leaves are like those of wall pellitory; the flowers are white and cinque-foliated, and produce a sort of brown berry, which, when ripe, turns to a deep red, and is generally about the size of a cherry. The berry contains a whitish, slimy pulp, and two small but hard yellowish grains, resembling a lentil in figure. The roots of *ipêcuanha* ought to be chosen new, plump, and unmix'd with suckers or filaments. It is much used as a medicine.

IRIDIUM, a metal discovered in the ore of platina, by Mr. Tennant. It is very similar in its appearance to platina; brittle, and very infusible. It forms always with the other metals; is soluble in the muriatic acid; of specific gravity 18.68. It adds much to the hardness of other metals when formed into alloys with them. A great proportion of it may be added to gold without sensibly altering the colour of the latter metal. Its oxides are of a deep blue, and dark red colour.

IRON, (GER. *Eisen*. DU. *Yzer*. DA. and SW. *Jern*. FR. *Fer*. IT. *Ferro*. SP. *Hierro*. PORT. *Ferro*. RUS. *Scheleso*. POL. *Żelazo*. LAT. *Ferrum*, Mars,) the most universal, the hardest, and the most durable of any of the imperfect metals. The two last-mentioned qualities belong to that part of the subject hereafter to be discussed, viz. the use of the article in manufactures and commerce. Its universality is a consideration which first demands a few brief observations, if it were only as a reasonable gratification or curiosity. It has been ascertained by frequently repeated experiments, at different periods, and by different persons, that iron enters into nearly all substances with which we are acquainted; as well vegetable, as animal. It circulates in the blood of men; it pervades the juices of vegetables, and is found in all the minerals, earths, and stones that have been within the reach of chemical analysis. Any detail of the experiments by which the correctness of these discoveries has been ascertained, equally exceeds our purpose, as our limits; but the results have been too long, and too well, established to render it necessary. Suffice it to say, that, by reducing those substances to ashes, which least promised to supply any proof of the incorporation of iron, the question has been placed beyond controversy. That it enters into all the varieties of natural substances in different degrees respectively, needs not to be dwelt upon; but some recent experiments have led to a persuasion that those vegetables which have astringent qualities, probably derive them from their superior abundance of this metal in their composition, and the rose has been particularly specified as affording an instance.

Iron is a production of the earth, common to many countries, but the best sorts, besides our own, are from Germany and Sweden, of which the last mentioned is the most valuable. In mass, iron is of a light, livid, grey colour; but it is found more frequently intermixed with other fossil productions, than in a pure state; and therefore partakes, in different degrees, of the hues of those with which it is intermixed.

The iron produced in Great Britain is obtained from three different kinds of ores, viz.

1. The *Lancashire ore*, so called from the county where it abounds; this is very heavy, of a fibrous texture; a dark purple colour, inclining to black, and lodged in veins like other metals.

2. The *bog ore*, which resembles a deep yellow clay, and has probably been deposited by some ferruginous rivulets; this ore is found in strata from 12 to 20 inches thick, and of various breadths.

3. *Iron stones* of an irregular shape, which frequently lie in beds of great extent, and, like other stony masses, are sometimes intersected with seams or veins of pit-coal. Of this kind there appear inexhaustible mines in Derbyshire.

Iron is prepared or manufactured in the following manner:

After the ore is dug out of the earth, it is crushed in a mill, and washed in a stream, in order to separate the grosser particles of earth. It is afterwards melted in furnaces heated with coke, charcoal, peat, or turf; near the bottom of which by means of a tap-hole, the liquid metal is discharged into furrows made in a bed of sand. The larger mass which settles in the main furrow is called by the workman a *sow*, and the smaller ones *pigs* of iron.

Stoves, grates, &c. are formed by casting ladles full of the rough metal in proper moulds made of sifted sand. In this state it is called *cast iron*; but if cooled too hastily, it becomes brittle, and is apt to crack like unannealed glass.

Although cast iron is so hard as to resist the file, it is nevertheless not malleable, but with a view to improve it, the raw iron is now melted down a second time in another furnace, where a strong blast of air is impelled on the surface of the metal; by this process, its fusion is considerably facilitated, and the iron concretes into a mass called a *loop*, that is conveyed beneath a large hammer, raised by the motion of a water-wheel. The metal is there beaten into a thick square form, again heated, so as nearly to melt it, and then forged. By repeating this process, the iron is rendered perfectly malleable, and at length formed into bars for sale.

Cast-iron has, nevertheless, been lately reduced to a state of malleability, by passing it through rollers instead of forging it.

This valuable improvement was first introduced in 1785.

By the above process, raw, or cast, iron is said to be freed from those impurities which are not discharged by the common method, and the iron so worked is equal, in some cases superior, to the best Swedish iron; it may also be procured at a cheaper rate, and a great saving may accrue to the nation.

When wrought iron, in bars, is laid in beds of charcoal, and exposed to a strong heat, it is divested of its oxygen, and becomes *steel*. *Cast-steel* may be formed by fusing iron in an intense heat with carbonate of lime. When the bars of iron are very thick, the carbon does not penetrate through the whole of the piece, the surface only is affected, and becomes hard, brittle, and susceptible of a high polish; this is called *case-hardening*.

Various compositions have been contrived for preventing iron from rust; but it appears that none is more effectual than common oil, although its use upon many occasions is at once troublesome and disagreeable.

Another mode which has been recommended for this purpose is to heat the iron to such a degree, that it cannot be touched without burning the hand, afterwards to varnish it with new white wax, and expose it to the fire till the wax is completely imbibed by the metal, which should next be rubbed over with a piece of serge.

According to others, this metal may be perfectly secured from rust by plunging it while red hot into linseed oil, which is suffered to drop off until it becomes dry, and then wiping the iron with a clean cloth. By this mode a black crust or varnish is formed, which renders it impervious to moisture. Again, others pour melted lead into the oil before it is applied to the *heated* iron; both these preparations require considerable skill and precaution.

Besides the uses of iron when manufactured into instruments; it is chemically employed in a variety of the arts. Sulphate of iron is used by hatters and dyers, when precipitated by gallic acid, for forming a black dye; it is also used for making ink; in the manufacture of Prussian blue; in preparing leather; and in forming *colcothan* for painters. The sulphate of iron is also used for making a shamoy-yellow colour in dyeing cotton; for this purpose a solution of iron in any acid is precipitated with alkali on the substance to be dyed.

IRONMONGER. This business is carried on by persons who deal only in iron and steel unwrought; but most of them sell iron and brass wrought up into innumerable articles, tools, and necessary implements; and some deal in both.

The *Ironmongers' Company* have a hall in Fenchurch-street, London: their charter was granted in 1462. The Livery fine is 30*l.* 12*s.*;

and they hold quarterly meetings at the option of the master.

IRON-MOULDS, are spots on linen, occasioned by its exposure to damp situations, also by ink accidentally dropped on the cloth.

These may be removed by moistening the stained part, sprinkling it with a small quantity of the essential salt of lemons; after which the linen is to be rubbed over a pewter plate, and the blot washed out with warm water.

A less expensive method, however, consists in wetting the spot, applying to it a few drops of spirit of salt, or lemon-juice, then rubbing it between the fingers for a minute or longer, while it is carefully held over a hot smoothing-iron or a basin filled with boiling water, the steam of which considerably facilitates the removal of the stains; but if spirit of salt be used, the linen or calico, or whatever be the article, must be instantly plunged into water after the application, or a hole will be burnt in it.

IRON-SICK, in the sea-language, is said of a ship or boat, when her bolts or nails are so eaten with rust, and so worn away, that they occasion hollows in the plank, whereby the vessel is rendered leaky.

IRON-WOOD, (GER. *Eisenholz*. DU. *Yserhout*. DA. *Ierntræe*. SW. *Iernträ*. FR. *Bois de fer*. IT. *Legno di ferro*. SP. *Palo hierro*. PORT. *Pão ferro s. barbuzano*. LAT. *Sideroxylon*, *Lignum ferreum*.) a species of wood of a reddish cast, so called on account of its corroding as that metal does, and its being remarkably hard and ponderous, even more so than ebony. The tree which produces it grows principally in the West India islands, and is likewise very common in South America, and in some parts of Asia, especially about Siam. Iron-wood is frequently employed in the manufacture of works of taste, and in the formation of such articles as are required to possess durability. It will not float in water, but sinks like metals.

ISERINE an ore of Titanium, found near the source of the Iser, on the borders of Bohemia, in small, obtuse, angular grains of an iron black, inclining to brown, much resembling iron-sand; and in pebbles of a rough, glimmering surface; of a conchoidal fracture; and shining internally with a semi-metallic lustre.

ISINGLASS, (GER. *Hausenblase*, *Hausblase*. DU. *Huisenblaas*. DA. *Hausblaas*, *Carlock*. SW. *Husbläs*. FR. *Colle de poisson*, *Carlock*. IT. *Cola di pesce*. SP. *Col-pez*. PORT. *Cola de peixe*. RUS. *Klei rybii*, *Karluk*. POL. *Klei rybii*, *Karluk*. LAT. *Ichthyocolla*.) is made from certain fish found in the Danube, and the rivers of Muscovy. Willoughby and others inform us, that it is made of the sound of the beluga (sturgeon); and Neumann that it is made of the huso germanorum, and other fish.

Mr. Jackson remarks that the sounds of cod, properly prepared, afford this substance; and that the lakes of America abound with fish from which the very finest sort may be obtained. The sounds or air-bladders of freshwater fish, in general, are preferred for this purpose as being the most transparent, flexible, delicate substances. These constitute the finest sorts of isinglass; those called book and ordinary staple, are made of the intestines, and probably of the peritonæum, of the fish. The beluga yields the greatest quantity, as being the largest and most plentiful fish in the Muscovy rivers; but the sounds of all fresh-water fish yield more or less fine isinglass, particularly the smaller sorts found in abundance in the Caspian sea, and several hundred miles beyond Astracan, in the Wolga, Yack, Don, and even as far as Siberia. Isinglass receives its different shapes in the following manner:

The parts of which it is composed, particularly the sounds, are taken from the fish while sweet and fresh, slit open, washed from their slimy *sordes*, divested of a very thin membrane which envelopes the sound, and then exposed to stiffen a little in the air. In this state they are formed into rolls about the thickness of a finger, and in length according to the intended size of the staple; a thin membrane is generally selected for the centre of the roll, round which the rest are folded alternately, and about half an inch of each extremity of the roll is turned inwards. The due dimensions being thus obtained, the two ends of what is called short staple are pinned together with a small wooden peg; the middle of the roll is then pressed a little downwards, which gives it the resemblance of a heart, and thus it is laid on boards, or hung up in the air to dry. The sounds which compose the long staple are larger than the former; but the workman lengthens this sort at pleasure, by interfold- ing the ends of one or more pieces of the sound with each other. The extremities are fastened with a peg like the former; but the middle part of the roll is bent more considerably downwards; and in order to preserve the shape of the three obtuse angles thus formed, a piece of round stick, about a quarter of an inch in diameter, is fastened in each angle with small wooden pegs, in the same manner as the ends. In this state it is permitted to dry long enough to retain its form, when the pegs and sticks are taken out, and the drying completed: lastly, the pieces of isinglass are strung up in rows, by running pack-thread through the peg-holes, for convenience of package and exportation. The membranes of the book sort, being thick and refractory, will not admit a similar formation with the preceding; the pieces, therefore, after their sides are folded inwardly, are bent in the centre, in such a manner that the opposite sides resemble the cover of a book, whence its name; a peg being

run across the middle, fastens the sides together, and thus it is dried like the former. This sort is interleaved, and the pegs run across the ends, the better to prevent its unfolding. That called cake isinglass is formed of the bits and fragments of the staple sorts, put into a flat metallic pan, with a very little water, and heated just enough to make the parts cohere like a pancake, when it is dried. Isinglass is best made in summer. The principal consumption of isinglass is in fining liquors of the fermented kind, and in making mock-pearls, stiffening linens, silks, gauzes, &c. Isinglass boiled in milk forms a mild, nutritious jelly, and is thus sometimes employed medicinally. This, when flavoured by the art of the cook, is the *blanc mange* of our tables. A solution of isinglass in water, with a very small proportion of some balsam, spread on black silk, is the court plaster of the shops.

JUJUBES. (GER. *Jujuben*, *Rothe, Brust-beeren*. DU. *Roodde borstebessen*, *Hamoten*, *Joben*. DA. *Brystbar*. SW. *Bröstbär*. FR. *Jujubes*, *Gingegoles*. IT. *Giuggiole*. SP. *Azufayfas*. PORT. *Anafegas*, *Macãa d'anafega*. POL. *Jujubowe jagody*. LAT. *Zizyphæ*, *Jujubæ*.) are the fruit of a tree (*Zizypha*) which grows commonly in Languedoc, Provence, the islands of Hieres, in several parts of Italy, and likewise in India and Persia. This tree is not quite so large as the plum-tree; its roots are usually closely entangled together; the bark is rugged like that of the vine; the branches are thorny; the leaves green, small, pliant, and somewhat indented; the flowers white; and the fruit, which is at first green, of the size and shape of an olive, grows yellow as it approaches to maturity, and contains a little nut that is also like that of the olive. Those jujubes which are fresh, large, fleshy, or plump, and remarkably dry, are esteemed the best. Jujubes do not keep well, more especially when they happen not to have been well dried at first, or to be left for any time in a damp situation. They are chiefly used in medicine, nearly for the same purposes as the common fig.

JUNIPER-BERRIES. (GER. *Wacholderbeeren*. DU. *Dambesien*, *Geneverbessen*. DA. *Enebær*. SW. *Enbär*. FR. *Bais de genièvre*. IT. *Coccole di ginipro*. SP. *Bayas de enebro*. PORT. *Bagas de zimbro*. RUSS. *Moshshuchii*. POL. *Jalowice jagody*. LAT. *Juniperi baccæ*.) There are twelve species of the tree from which these berries are gathered. The most remarkable are the common juniper, which is found in many parts of Britain upon dry, barren commons, where it seldom rises above the height of a low shrub, which grows naturally only in dry, chalky, or sandy land. Of this species there is a variety called Swedish juniper, which grows ten or twelve feet high, very branchy the whole length.

The Spanish juniper rising from ten to fif-

teen feet high, closely branched from bottom to top; and the blue-berried Spanish juniper upwards of twenty feet high.

The propagation of all the junipers is by seed.

Juniper-berries have a strong, not disagreeable smell; and a warm, pungent, sweet taste, which, if they are long chewed, or previously bruised, is followed by a bitterish one. The pungent seems to reside in the bark, the sweet in the juice, the aromatic flavour in oily vesicles spread through the substance of the pulp, distinguishable even by the eye, and the bitter in the seeds.

These berries are chiefly used in the distilleries of Holland, and Great Britain, to give flavour to the geneva of the former, and the gin of the latter. For this purpose the essential oil of the juniper is, or ought to be used. This oil when mixed with that of nuts, makes an excellent varnish for pictures, wood-work, and preserving iron from rust. See DISTILLATION.

JUNK, among shipwrights, is made from old cables, which, for this purpose, are cut, with a hatchet, untwisted, and pulled out into loose hemp; it is used for caulking of ships.

JURY-MAST, among mariners, is what is set up instead of a mast carried away in a storm, or lost through some other casualty. The derivation of the term has puzzled all the antiquaries.

IVORY, (GER. *Elfenbien*. Du. *Yvoor*. DA. *Elfenbeen*. Sw. *Elfenben*. FR. *Ivoire*, *Voire*. IT. *Aorio*, *Avolio*. SP. *Marfil*. PORT. *Marfim*. RUS. *Kost slonowja*. POL. *Sloniowa Kose*. LAT. *Ebur*.) a hard, solid, and firm substance, of a white colour, and capable of a very good polish. It is the tusk of the elephant, and is hollow from the base to a certain height, the cavity being filled up with a compact medullary substance, seeming to have a great number of glands in it. The Ceylon ivory, and that of the island of Achem, do not become yellow in the wearing, as all other ivory does; for which reason the teeth of these places bear a larger price than those of the coast of Guinea.

Ivory is usually brought to us from the coasts of Africa, where elephants abound, especially in the vicinity of Rio Fresca, the river Gambia in Senegal, and along the Ivory coast. The parts of Asia whence ivory is procured, are the island of Ceylon, the kingdoms of Achem and Pegu, and from Siam and Arca. The elephants' teeth of the East are not more than three or four feet in length; but those of Africa, especially such as we procure from Bombaza, and Mozambique, are seldom less than ten feet long, and are so heavy, that two men can with difficulty carry one of them. Ivory, among the wholesale dealers in this article, is divided into elephants' teeth, pro-

perly so called, and schriivelli, or schriivellos, which last consist of the smallest teeth, and fragments.

The grand consumption of this commodity is for making ornamental articles, mathematical instruments, cases, boxes, balls, combs, dice, and a variety of toys.

To soften ivory and other bones, lay them twelve hours in aqua-fortis, and then three days in the juice of beets, and they will become so soft that they may be worked into any form. To harden them again, lay them in strong vinegar. Dioscorides says, that by boiling ivory for the space of six hours with the root of mandragoras, it will become so soft that it may be managed as one pleases.

To remove spots, the ivory should be laid in unslaked lime, and a small quantity of water poured on it, lest the heat should be too intense, and the ivory scale, or become brittle: others discharge the stains by steeping it for some time in strong lime-water.

To dye Ivory.

Green.—This colour is imparted to ivory by a solution of copper or verdigris in aqua-fortis, or by grinding together two parts of verdigris and one of sal ammoniac.

Purple.—Take four ounces of aqua-regia and one of sal-ammoniac.

Yellow.—Ivory, bone, horn, &c. may be stained yellow, by previously boiling them in a solution of one pound of alum in two quarts of water, then immersing them for half an hour in a liquor prepared by boiling half a pound of turmeric in a gallon of water, until it be reduced to three quarts, and afterwards plunging the coloured substance into alum water.

Blue.—All bony matters may be stained blue by first tinging them with green, and then dipping them into a hot and strong solution of pearl-ashes.

IVORY-BLACK, (GER. *Elfenbienschwarz*. Du. *Fluweelzwart*. DA. *Elfenbeen svarte*. Sw. *Elfenben svarta*. FR. *Noir d'ivoire*. IT. *Nero d'avorio*. SP. *Negro de Marfil*. PORT. *Negro de Marfim*.) is the coal of ivory, or bone, formed by great heat, while deprived of all access of air. It is now, however, very well known that very little, if any, of what is called ivory-black is made in this manner, except some of the finest sorts used by miniature painters; a great deal of what is sold under this name is the charcoal of the hard woods reduced to powder. See BLACK, Ivory.

JURY, twelve men, who are sworn well and truly to try the matter in issue between the parties, and to give a true verdict according to the evidence.

The trial by jury is one of the most valuable privileges of Englishmen; it is contemporary with the very foundation of the state, and acknowledged by *Magna Charta*.

Juries are of two kinds, the *Grand*, and the *Petit Jury*; the first finds the accusation

only, and whether there be sufficient evidence to put the party upon his trial; the second deliberates upon the merits, as proved in evidence on both sides, and deliver the verdict accordingly.

Juries may be further divided into *Common* and *Special*; the former decide upon causes of usual occurrence, and the latter is impanelled for the decision of points of great commercial interest and superior intricacy and importance.

The Grand Jury may consist of an indefinite number, but no more should be sworn than twenty-three.

The following are the qualifications of urymen:

The sheriffs in London shall not return any person to try any issue in the King's Bench, Common Pleas, or Exchequer, or at any session of peace to be held in the city, who shall not be an housekeeper within the said city, and have lands, tenements, or personal estate to the value of 100*l.*; and no juror shall be impanelled for the trial of any capital offence, who would not have been qualified to serve as a juror in civil cases.

Leaseholders in Middlesex, where the improved rents or value shall amount to 5*l.* per annum over and above the ground-rent or reservations, shall be liable to serve on juries.

Jurymen in the country possessed of 10*l.* and in Wales 6*l.* are qualified, and shall be compelled to serve on juries.

Trials of felons, in towns corporate, shall be by men worth 40*l.* in goods, although they have no freehold.

No qualification of jurors is required on the coroner's inquest, but they must be of the neighbouring towns.

Persons under twenty-one years, or upwards of seventy, such as are sick continually, and such as are so at the time of the summons, shall not be put upon juries.

Serjeants at law, counsellors, attorneys, and officers of the courts, peers of the realm, clergymen, dissenting teachers, quakers, apothecaries, and butchers, are not liable to be summoned as jurymen.

If the jury are uncertain with respect to the law, they may give a special verdict, which is finding the particular facts subject to the opinion of the court, as to the application of the law.

JUSTIFYING BAIL is effected by the bail swearing that they are each worth the sum for which they offer themselves, in open court.

JUTE, a strong vegetable fibre found in India, and applicable to a variety of purposes in manufacture.

KAL

KAL

K, The tenth letter of our alphabet, as a numeral denotes 250; and with a dash over it, thus, $\overline{K}$, stands for 250,000.

KALEIDOSCOPE, a word derived from the Greek language, and signifying "to see a beautiful form." This instrument, in its simplest form, consists of two reflecting planes made either of new plate glass, or speculum metal, ground perfectly flat, and highly polished. The plates may be of any length, but that which is most convenient will be found to be from 5 to 10 or 12 inches. Their breadth should be about 8 or 9-tenths of an inch, when the length is 6 inches, but the breadth should increase with the length in order to have the aperture of the same angular magnitude. Two of the edges of these reflectors, after they are carefully ground to a straight line by the finest emery, and freed from all roughness and imperfection, are placed together by a particular contrivance in such a manner, that their inclination, or the angle which they form, is exactly an even aliquot part of a circle, or a 4th, 6th, 8th, 10th, 12th, 14th, 16th, 18th, 20th, &c. part of 360°. When the plates are thus fixed in a brass tube, and the eye placed at one end of them, it will perceive a circular field of view, composed

of as many luminous sectors, as the number of times that the angle formed by the reflectors is contained in 360°. These sectors, excepting the one seen by direct vision and constituting the angular aperture of the plates, are a series of images of this aperture formed by successive reflections between the inclined reflectors. The images formed by one reflection from each of the plates lie on each side of the direct aperture, and are inverted images of that aperture; the next two images, formed by two reflections, are images not inverted, and so on throughout the whole series, every two direct images being separated by an inverted one.

The tube which contains the reflecting plates moves in another tube; and upon the outer end of this last tube, is placed a brass cell, or cap for receiving a series of object plates containing fragments of differently coloured glass, and other substances placed at random. When one of these object plates is pushed into the cell, the cell is placed upon the end of the outer tube, and the inner tube pushed as far as it will go. The instrument being held in one hand, the cell containing the objects, is moved round with the other, and the eye of the observer being placed at the narrow end of the tube, he

will observe the irregular masses of colour arranged in an infinite variety of forms, mathematically symmetrical, and highly pleasing to the eye.

In the preceding form of this instrument, the object must be placed close to the end of the reflectors; for if it is removed from this position the symmetry is destroyed. This instrument is useful in the arts, especially to calico printers. It has become an article of export in a small degree.

KALI, *glass-wort*, a kind of plant that grows on sea-coasts, which is burnt to procure mineral alkali. Its ashes, commonly called pot-ashes, made into a ley, and boiled with oil, make the best sort of soap. From the same ashes called *pulverine*, is extracted an alkaline salt, which, mixed with sand, makes crystal glass. In Languedoc they procure ashes thus: when the plant has grown up, they cut it down, leaving it to dry; it is afterwards calcined in pits like lime-kilns, closely covered with earth, that no air may come at the fire. Thus it is not only reduced into ashes, but made into a very hard stone, resembling rock-salt, which they are obliged to break with large hammers to get it out. See **ASHES**.

KAOLIN, the name of an earth which is used as one of the two ingredients in oriental porcelain.

KAY, **KEY**, or **QUAY**, a wharf or building of stone by the water-side in a seaport, for lading and unlading goods.

In all the maritime ports of Great Britain, quays have been constructed to a considerable extent, and furnished with capacious magazines for the reception of goods. Dwelling-houses have also been generally erected for greater convenience in superintending the whole, and a constant residence of certain persons on or near quays has become necessary to check the depredations committed by various descriptions of *river pirates*, who avail themselves of the opportunity afforded by the night, to defraud the revenue, as well as to rob the owners of merchandise, to a very considerable amount.

The following are the quays belonging to the city of London, viz. Chester's, Brewer's, Galley, Wool-dock, Custom-house, Porter's, Sabb's dock, Wiggen's, Young's, Ralph's, Dice, Smart's, Hammond's, Lyon's, Botolph-wharf, Gaunt's, Cocke's, Freche-wharf, and Billingsgate and Bridge-house, for landing fish and provisions.

KECKLE, or **KECKLING**, in the sea language, is the winding of old ropes about cables, to prevent them from gailing.

KEDGE, or **KEDGER**, a small anchor generally used in rivers.

KEDGING, in the sea language, is when the ship is brought up or down a narrow river by means of the tide, the wind being contrary.

KEEL, the lowest piece of timber in a

ship, running her whole length, from the lower part of her stern to the lower part of her stern-post. Into it all the lower futtocks are fastened; and under part of it a false keel is often used.

Dr. Franklin speaks in terms of commendation of a moveable keel, for the purpose of navigating a boat with the greater facility in shoal water. The keels of boats, it is well known, very frequently prevent them from running quick on shore; this inconvenience is proposed to be remedied by forming the keel of two longitudinal pieces of timber, which rest upon hinges. To the bottom of each piece of timber two chains are affixed, the ends of which being retained within the boat, the keel, or rather the two half-keels, can immediately be drawn up close to the sides of the boat, and lowered again at pleasure.

KEEL-BOAT, the name of a flat-bottomed vessel used for conveying coals from the shore to the ship.

KEELSON, or **KELSON**, a principal timber in a ship, laid withinside across all the floor-timbers; and being adjusted to the keel with suitable scarfs, it serves to strengthen the bottom of the ship.

KEER, or **CEER**, a weight used in some cities of the late territories of the Great Mogul, particularly at Agabar and Ziamger; in the first of which places it weighs thirty-six small weights of one pound and a quarter, marc; and in the other thirty-six of one pound and a half.

KEG or **CAG**, a small barrel, or cask, containing from four to five gallons of sturgeon. A keg of spirits contains half an anchor, or five gallons.

KELP, in the glass trade, a term used for a sort of potash made use of in many of the glass-works, particularly for the green glass. It is the calcined ashes of a plant called by the same name; and in some places "sea-tags," or "laces," a sort of thick-leaved fucus or sea-wrack. This plant is thrown on the rocks and shores in great quantities, and in the summer months is raked together and dried as hay in the sun and wind, and afterwards burned to the ashes called kelp.

The preparation of kelp is carried on to a wonderful extent in Scotland and Ireland. See **SCOTLAND**, article **EUROPE**.

KEN, a sort of an ell, used at Siam, nearly three feet; two kens making one voua, equal to a French toise, less one inch; the ken likewise makes two socks, the sock two keubs, the keub twelve niou, and eight grains of unlusked rice to a niou, equal to nine French lines.

KENKS, or **KINKS**, in the sea-language, doublings in a rope or cable, when handed in and out, so that it does not run easy; or when any rope makes turns or twists, and does not run free in the block.

KEPATH, a small weight used by the Arabians; it is half a danck or dank, that is

the grain; twelve kepaths make the dirhem dragma of Arabia.

KERMES, (GER. *Scharlachbeeren*. DU. *Grein*, *Scharlakenbessen*. DA. *Kermesbær*. SW. *Kermesbär*. IT. *Grana*, *Chermes*, *Cremese*, *Cocchi*. SP. *Grana Kermes*, *Grana de la coseoja*. PORT. *Grãa Alquermes*, *Kermes*. RUS. *Berri*. POL. *Szarlatne jagody*. LAT. *Grana chermes*.) an insect of the genus called, in natural history, *coccus*. The rostrum proceeds from the breast; the belly is bristly behind, the wings of the male are erect; and the female has no wings. The species are twenty-two, denominated principally from the plants they frequent.

The *coccus ilicis*, or that forming the kermes, inhabits the *quercus coccifera* (a species of oak) of the southern parts of Europe. Both ancients and moderns seem to have had very confused notions concerning the origin and nature of the kermes; some considering it as a fruit, without a just knowledge of the tree that produced it; others taking it for an excrescence formed by the puncture of a particular fly, the same as the common gall observed upon oaks; but it was finally discovered that the kermes is in reality nothing else but the body of an insect transformed into the resemblance of a grain, berry, or husk, according to the course of nature. The progress of this transformation must be considered at three different seasons. In the first stage, at the beginning of March, an animalcule, no larger than a grain of millet, scarcely able to crawl, is perceived sticking to the branches of the tree, where it fixes itself, and soon becomes immoveable: at this period it grows most, and appears to swell and thrive with the sustenance it draws in by degrees. At the second stage, in April, its growth is completed, its shape is now round, and about the size of a pea: it has acquired more strength, the down which covered it is changed into dust; and it seems nothing but a husk or capsule, full of reddish juice, not unlike discoloured blood. Its third state is towards the end of May, when the husk appears replete with small eggs, less than the seed of a poppy. These are properly ranged under the belly of the insect, progressively placed in the nest of down that covers its body, which it withdraws in proportion to the number of eggs. After this work is performed it soon dies, though it still adheres to its position, rendering a further service to its progeny, and shielding them from the inclemency of the weather, or the hostile attacks of an enemy. In good seasons they multiply exceedingly, laying from 1800 to 2000 eggs, which produce the same number of animalcules. In France, the poor people who gather the kermes, let their nails grow, in order to pick them off the trees with greater facility.

The kermes is found in abundance in Provence, Languedoc, Spain, and Portugal,

large quantities are also brought from the Levant. That of Languedoc is esteemed the best of any; the Spanish and Portuguese is very small, nor does it afford a good colour. Kermes is principally employed in dyeing, on account of its imparting a fine scarlet or crimson colour; but it is likewise used in pharmacy as an astringent medicine. If the living insect be bruised, it gives out a red colour. Its smell is somewhat pleasant; its taste a little bitter, rough, and pungent. When dry, it communicates this smell and taste to water, and also to alcohol, to both of which it gives a deep red colour. This colour is retained by the extracts made from these infusions. To dye spun wool with kermes, it is first boiled half an hour in water with bran; then two hours in a fresh bath, with one-fifth of Roman alum, and one-tenth of tartar, to which *sour water* is commonly added; after which it is taken out, tied up in a linen bag, and carried to a cool place, where it is left some days. To obtain a full colour, as much kermes as equals three-fourths, or even the whole of the weight of the wool, is put into a warm bath, and the wool is put in at the first boiling. As cloth is more dense than wool, either spun or in the fleece, it requires one-fourth less of the salts in the boiling, and of kermes in the bath. Less proportions of kermes will produce lighter and paler colours. If we want a succession of shades, we must, as usual, begin with the deepest. By using kermes and tartar, without alum, but with as much solution of tin as is required for a scarlet, with cochineal, Hellot obtained a very lively cinnamon colour in a single bath. Cloth steeped in a solution of sulphat of potash, took with kermes a pretty fine and permanent agate grey: in a solution of sulphat of iron and tartar, a fine grey: in a solution of tartar and sulphat of copper, an orange colour: and the same with nitrat of copper. Solution of bismuth added drop by drop to a kermes bath, produced a violet. All acids convert it to a cinnamon colour, which inclines more or less to red, according as the acids are weak, and their quantity small. Alkalies render its colour dull and rosy. The colour that kermes imparts to wool is less bright than the scarlet made with cochineal.

KERMES MINERAL, a compound of sulphuret of antimony and potash. It is principally employed for medicinal purposes.

KERSEY, (GER. and DA. *Kirsey*. DU. *Kaarsai*. SW. *Kersing*. FR. *Carisée*, *Creseau*. IT. *Carisea*, *Calisello*. SP. *Carsaia*. PORT. *Carisea*. RUS. *Karassea*.) a species of coarse woollen stuff, usually woven in ribs.

Kerseys are manufactured in large quantities at Leeds, Halifax, and other parts of Yorkshire, as also at Exeter. These articles are exported to the continent of Europe, principally from the port of Hull. Several attempts have been made abroad to rival

the English in this branch of manufacture, especially at Hall in Germany, and in some parts of the Low Countries, but they have all proved abortive. Long wools are those mostly used in the manufacture of kerseys.

KERSEYMERIE, a species of thin woollen stuff, generally woven plain, and made from the finest wools. It is manufactured principally in the west of England, and is almost exclusively employed in the formation of breeches, pantaloons, waistcoats, ladies' habits, pelisses, &c.

KETCH, in naval architecture, a vessel with two masts, usually applied to one carrying bombs, or rather mortars.

KETCHUP. See **CATSUP**.

KETTLES, (GER. *Kessel*. DU. *Ketels*. DA. *Kedler*, *Kiedler*. SW. *Kittlar*. FR. *Chaudières*, *Chaudrons*. IT. *Caldaje*, *Caldari*, *Caldaroni*. SP. *Calderas*, *Calderos*. PORT. *Caldeiras*. RUS. *Kotli*. POL. *Kociel*.) vessels made of tin, copper, or iron, for boiling water and other liquids in; and of which there are various kinds, some being employed merely for domestic purposes, and others in almost every branch of manufacture. Kettles of all descriptions are manufactured at Sheffield, Birmingham, Wolverhampton, &c. &c.

KEUB. See **KEN**.

KEVEL, in shipbuilding, a piece of plank laid against the quickwork on the quarter-deck, in the shape of a semicircle; about which the running rigging is belaid.

KEY. See **KAY**.

KEY, (GER. *Schlüssel*. DU. *Sleutels*. DA. *Nogler*. SW. *Nycklar*. FR. *Clés*, *Clefs*. IT. *Chiavi*. SP. *Llaves*. PORT. *Chaves*. RUS. *Kljutsch*. POL. *Klucz*.) a well-known instrument formed with openings correspondent to the wards of a lock.

KEYAGE, the money or toll paid for loading or unloading goods, &c. at a key or wharf.

KHALLAH GILLEE, a species of prohibited Bengal muslin.

KHATOVAT, a long measure used in Arabia; it is the geometrical pace of the Europeans: it contains three akdams, or feet, and 12,000 khatovats make the pangsang.

KIDDER, signifies one that badges or carries corn, dead victual, or other merchandise up and down to sell. 5 Eliz. c. 12. They are also called *kiddiers*. 15 Eliz. c. 25.

KIDNAPPING, is the forcibly taking and carrying away a man, woman, or child from their own country, and sending them to another. This is an offence at common law, and punishable by fine, imprisonment, and pillory. If any captain of a merchant vessel shall, during his being abroad, force any person on shore, and wilfully leave such person behind, or refuse to bring home all such men as he carried out, if able and desirous to return, he shall suffer three months' imprisonment. Exclusive of the above pu-

nishment for this as a criminal offence, the party may recover upon an action for compensation in damages for the civil injury. 11 & 12 Will. 3. c. 7. In common parlance, the term is applied to the offence of *child-stealing* generally; what is declared by stat. 54 Geo. 3. c. 101. to be an offence punishable as grand larceny. See 3 Dict. Pract. Expos. 1.

KID-SKINS are the skins of the young goat, which are chiefly used in the manufacture of women's fine gloves, such as the French gloves, Limerick gloves, &c. We usually import them from France, Spain, and Italy, undressed, and afterwards prepare them for use.

KIFFEKIL, or **KEFFEKIL**. This mineral is dug up near Konie in Natolia, and is employed in forming the bowls of Turkish tobacco-pipes. The sale of it supports a monastery of dervises, established near the place where it is dug. It is found in large fissures, six feet wide, in grey calcareous earth.

KILDERKIN, a liquid measure, generally applied to beer, containing two firkins or eighteen gallons. Two kilderkins make a barrel.

KINO. It was first brought from Gambia, but what is now imported chiefly comes from Jamaica, and is an extract of the sea-side grape, *coccoloba uvifera*: the finest, however, is drawn from different species of *eucalyptus*, particularly the *resinifera*, or brown gum-tree of Botany Bay. Wool and cotton boiled in a solution of kino, and then dipped in a bath of sulphat of iron, appeared of a bottle-green, which was changed by washing and drying to a blackish-brown, that proved very durable.

KINTAL. See **QUINTAL**.

KISTE, a liquid measure of Arabia, equal to a pint of our measure.

KNEE, in a ship, a crooked piece of timber, bent like a knee, used to bind the beams and futtocks together, by being bolted fast into them both. These are used about all the decks.

KNEES, *Carling*, in a ship, those timbers which extend from the sides to the hatchway, and bear up the deck on both sides.

KNIVES, (GER. *Messer*. DU. *Messen*. DA. *Knive*. SW. *Knivar*. FR. *Couteaux*. IT. *Coltelli*. SP. *Cuchillos*. PORT. *Facas*. RUS. *Noshi*. POL. *Noze*.) are well-known utensils made of iron and steel, and employed to cut with; they are principally manufactured at London, Salisbury, Sheffield, and Birmingham. Knives are made for a variety of purposes, as their different denominations imply; such as, table-knives, oyster-knives, pruning-knives, pen-knives, &c. They are said to be of such recent invention as the middle of the 16th century. However that be, they are now an article of extensive exportation to all parts of the world. The German fairs are plentifully supplied with

them, and they travel to both the Indies in immense quantities.

KNITTING-NEEDLES, (*Ger.* *Stricknadeln*. *Du.* *Breinaalden*. *Da.* *Knyttstikker*, *Striknaale*. *Sw.* *Knytnalar*. *Fr.* *Aiguilles*, *Broches à tricoter*. *It.* *Aghio*, *Ferri da calze*. *Sp.* *Agujas para hazer medias de punto*. *Port.* *Agulhas de facer meias*. *Rus.* *Igolki*.) pieces of iron or steel wire, about eight inches in length, rounded and highly polished. They are not perforated at either end like common needles, nor are their extremities remarkably sharp-pointed. Knitting-needles are principally employed by females in making thread and worsted stockings.

KNOTS of the *Log-line*, are the divisions made thereon, which are usually seven fathoms, or forty-two feet; but ought to be fifty-one feet: and then, as many knots as the log-line runs out in half a minute, so many miles does the ship sail in an hour,

supposing she goes at an equal rate, and allowing for yaws, lee-way, &c. See **LOG**.

KRUSKA, a Russian liquid measure of $93\frac{7}{8}$ cubic inches.

KUPFERNICKEL, is a sulphuret of nickel, and is generally compounded of nickel, arsenic, and sulphuret of iron. It is supposed to be employed by the French manufacturers in colouring porcelain or enamels.

KUTERA, a gum somewhat resembling tragacanth, but not of so glutinous a nature, lately imported from Hindostan. In water it slowly softens to a pulp: but if first powdered, and then boiled a quarter of an hour, it dissolves completely, a tea-spoonful giving to three pints of water a thin syrupy consistence. The natives of India mix it with other gums to make varnishes, and use it much in some diseases of horses. *Trans. of Soc. of Arts.*

L A B

L, The eleventh letter of our alphabet, as a numeral denotes 50; and with a dash over it thus, $\bar{L}$, stands for 50,000. **L** is likewise the initial of the Latin word *librum*, signifying a pound, and is thus written $\pounds$, to denote the amount of twenty shillings. lb denotes a pound weight.

LABDANUM, or **LADANUM**. See **GUM**.

LABORATORY, a building containing apparatus and all the conveniences necessary for conducting chemical researches and experiments.

The following is a list of the necessary implements for a perfect establishment of this kind:

A gasometer, with the connecting tubes, blow-pipe, &c.;

A bladder, or silk-bag, with stop-cock, fitting the above;

A pneumatic water-trough;

A copper still with worm-tube, the still fitting into the top of Black's furnace;

A blow-pipe, with spoon, &c.;

Lamps — an Argand, and others of common construction, for oil and alcohol;

An apparatus for drying precipitates by steam;

Scales and weights;

Large and small iron stands for retorts, &c.

Mortars—one of hard steel, one of bell-metal, and one or two of Wedgwood-ware;

A silver crucible and spatula;

A platina crucible and spatula;

A jointed iron tube for conveying gases.

The following Articles in Glass.

Retorts of different sizes, plain and stoppered, and long-necked for gases;

L A B

Receivers to fit the above, plain and stoppered, with or without an adapter;

Plain jars for gases, different sizes;

Lipped jars for mixtures, precipitates, &c.;

A graduated eudiometer jar;

Bell receivers, two or three sizes;

Proof bottles;

Capsules, or small evaporating cups, and watch-glasses;

Florence flasks;

Matrasses;

Funnels;

Wine-glasses;

Common decanters;

A bottle for specific gravity of fluids;

Phials of all sizes, plain and with ground stoppers;

Plain glass tubes, of various thickness and bore, out of which may easily be made,

Syphon tubes, bent tubes for gases, capillary tubes for dropping liquids, &c.;

A gas saturating apparatus;

A Woulfe's apparatus;

A tube of safety, separate;

A barometer;

Thermometers.

The following in Earthen-ware.

Crucibles, Hessian, common, and black-lead, of different sizes and shapes, with stands and covers;

Retorts;

Retort stands;

Cupels;

Wedgwood evaporating dishes;

White basons with lips;

Tubes, straight and bent;

Porcelain spoons;

Porcelain rods;
Several stone jars, with tin covers.

The following Sundries.

Wire, different sizes and kinds;
Gold, silver, and brass leaf, and tinfoil;
Wooden tripod stands;
Steel spatula and pallet knives;
Iron ladles;
Diamond for scratching glass;
Files;
Hammers;
A vice and anvil;
Pincers;
Shears and scissors;
A magnet;
Sieves;
Filtering paper;
Corks;
Bladders, spirit-varnish, sponge, tow, linen, flannel;
Windsor and common bricks;
Lutes of various kinds;
A mercurial pneumatic trough;
A mercurial gasometer;
A burning lens;
An electric apparatus;
A Galvanic apparatus;
A detonating jar;
A glass or silver alembic.

LABOURERS are generally understood to be persons hired by the day, or other short period of time, to work in inferior capacities.

The mode of hiring, hours of labour, punishment, &c. of servants and labourers, in some particular trades are specially provided for by particular statutes respecting those trades; but by 20 Geo. 2. c. 19. all complaints between masters and labourers of all descriptions, where the sum in dispute does not exceed *5l.* are cognizable before justices of the peace, who shall make order therein. And by a subsequent statute, 6 Geo. 5. c. 25. all labourers who shall have contracted for any certain time, and who shall be guilty of any misdemeanour, or not fulfil his contract, is punishable before the like authority by imprisonment not exceeding three months nor less than one. *Lowther v. Earl of Radnor*, 8 East. Rep. 113.

See the different modes of proceeding under these two statutes, *Dick. Pract. Expos.* 843.

LABRADOR is an extensive country in North America. It is bounded N. by Hudson's Strait, on the S. by Lower Canada, on the W. by Hudson's Bay, and on the E. by the Gulf of St. Lawrence; and is a portion of that continent over which Great Britain has made a claim of sovereignty. We know little of the extent, or productions, of the interior; for the soil is generally so sterile, the winters so cold, and the whole appearance of the country so desolate, that we have little communication with it, except with the Esquimaux, a people who live on

the coast, and with whom the Canadians keep up a regular intercourse for the purpose of trading for furs, which abound in this country, and are eminently fine and valuable. The animals common among them are bears, both black and white; reindeer, wolves, and wolverines; foxes of various sorts; martens, lynxes, and racoons; otters, beavers, and minks; hares, rabbits, and moles: the skins of all which find their way to Britain through the traffic of the Canadian merchants. The colder the climate, the better is the fur of the animals with the longest hair and the roughest coats, wherefore the bear-skins of Labrador are pre-eminently beautiful. The shores abound in seals, and the Canadians have a seal fishery on the southern part of the coast, where a great portion of the traffic is carried on.

LABRADOR STONE, a beautiful stone brought from the coast of Labrador. Its colour is commonly of a light, or of a deep grey, frequently blackish; but when held in certain positions to the light, it exhibits varieties of beautiful internal colours, chiefly consisting of shades of blue and green, seldom yellow, in some parts of a copper red, and violet. These colours have, for the most part, a flaky or spotted appearance, but sometimes they lie in stripes. This stone is found of an angular form, in pieces of considerable magnitude; its specific gravity is 2.755; its fracture is laminated; the broken parts are rhomboidal and semi-transparent. In other respects this stone agrees with the feldt-spar, but is softer.

LAC, or GUM-LAC, (GER. *Lack*, *Gummilack*. DU. *Lak*, *Gomlak*. DA. *Lack*, *Gummilak*. SW. *Lack*, *Gummilak*. FR. *Lacque*, *Gomme lacque*. IT. *Lacca Gommalacca*. SP. *Goma laca*. PORT. *Laca*. RUS. *Laka*, *Gummilak*. POL. *Laka*, *Gumalaka*. LAT. *Gummi lacca*.) is the product of the *coccus lacca*, an insect, which deposits its eggs on the branches of a tree called *Bihar*, in Assam, a country bordering on Thibet, and elsewhere in India. It appears designed for defending the eggs from injury, and affording food for the maggot in a more advanced state. It is formed into cells finished with as much art and regularity as a honeycomb, but differently arranged; these the inhabitants collect twice a year, in the months of February and August. To purify it, it is broken into small pieces, and put into a canvas bag of about four feet long, and not above six inches in circumference. Two of these bags are in constant use, and each of them held by two men. The bag is placed over the fire and frequently turned, till the lac is liquid enough to pass through its pores; when it is taken off the fire, and twisted in different directions by the men who hold it.

Lac possesses the properties of a resin, and is the basis of many varnishes, and of the finest kinds of sealing-wax. It is used

in painting, and imparts a fine red colour to silk and cotton, when these have been previously immersed in a weak decoction of the bark, known amongst dyers by the name of *lead*.

In India lac is fashioned into rings, beads, and other trinkets: wool tinged with it is employed as a fucus by the ladies; and the resinous part, melted and mixed with about thrice its weight of finely powdered sand, forms polishing stones. The lapidaries mix powder of corundum with it in a similar manner.

LAC, White, or LACCIC ACID. About the year 1786, Dr. Anderson, of Madras, was made acquainted with a substance formed as a kind of nidus or nest by the female of an insect of the genus *coccus*, of which the natives of India are very fond. This substance, which has a considerable resemblance to bees' wax, he named white lac. It is of a grey colour, opaque, rough, and in roundish pieces, weighing from three to fifteen grains; and on pressing it between the fingers, particularly when fresh gathered, a reddish fluid is squeezed out. When purified by fusion and straining through cloth, it adheres so firmly to wood, paper, tin, and other substances, as to answer the purpose of a strong cement. It does not afford a good varnish.

LACE, (GER. Spitzen. DU. Kanten. DA. Kniplinger. SW. Spetsar, Knytringar. FR. Dentelle. IT. Merletti, Pizzi. SP. Encajes. PORT. Rendas. RUS. Krushewo. POL. Koronki,) is a texture composed of many threads of gold, silver, silk, or thread, which are interwoven and worked on a cushion from bobbins, according to the patterns designed. Thread lace is of various kinds, denominated either from the place where it is manufactured, or from the particular method of working. Such are Point, Brussels, or Flanders lace manufactured in the Netherlands, and Blond, or bone lace, which is manufactured in Buckinghamshire. - An inferior kind of lace is made at Nottingham, which is manufactured on a loom similar to that on which hosiery is made; this is called *British Lace*.

The following are the regulations of the legislature relative to gold and silver lace.

No metal inferior to silver shall be spun upon silk, under a penalty of 5*l.* per oz. Silver wire for making silver thread shall contain at least 11oz. 15 dwts. in the pound troy; and all silver used in the wire-drawers' trade shall have 11 oz. 8 dwts. of fine silver for every pound troy; and shall not have less than 4 dwts. 4 grs. of fine gold, without alloy, laid on each pound of silver, on penalty of 5*l.* per oz.

Persons colouring gilt-wire with verdigris, or any forced colour, are liable to a penalty of 2*s.* 6*d.* per oz.

For gold and silver prepared as above, and wrought into plate, there shall be al-

lowed 6 oz. of plate, to 4 oz. of silk, except large twists, &c. and round brocade, in which there shall be allowed 6 oz. of plate to 5 of silk.

Selling gold or silver lace, mixed with any other metal, incurs a penalty of 2*s.* 6*d.* per oz. and 5*s.* per oz. for selling by any other than troy-weight.

No gold or silver thread, lace, fringe, or other work made thereof, or thread, &c. made of copper or other inferior metal, or gold or silver wire, or plate, shall be imported, on pain of being forfeited and burned.

Thread Lace of foreign manufacture is prohibited, except in certain specified quantities and of particular value, by stat. 46 Geo. 3. c. 81. and may be only imported into the port of London under very peculiar circumstances. Dealers in lace, whether *foreign*, or *British*, must take out an annual licence from the excise office, under a penalty of 50*l.* for dealing in the former, and 5*l.* in the latter; and must moreover place upon their shop, "Dealer in *foreign*, (or *British*, as the case may be) lace," under similar penalties.

LACES, (GER. Schnüren, Litzen. DU. Snoeren, Lissen. DA. Snorer, Lisser. SW. Snärrar, Lits. FR. Cordons. IT. Cordoni. SP. Cordones, Torzal. PORT. Cordões, Torçal. RUS. Snurki. POL. Sznurki,) a species of cord made of silk, thread, cotton, &c. principally used by women in adjusting different parts of their apparel; they are chiefly manufactured at Manchester, and in its vicinity.

LACK, or LAKE, a word used in the East Indies to denote the sum of 100,000 rupees, which, supposing them standards, or siccas, at 2*s.* 6*d.* amounts to 12,500*l.* sterling.

LACKER, or LACQUE, is a species of varnish applied to brass, tin, and other metals, to improve their colour, and prevent them from tarnishing. The best lacker is prepared from rectified spirit of wine and seed-lac, in the proportion of three ounces of the latter to one pint of the former. This mixture is digested for some time in a moderate heat, when the liquor is strained and left to subside. In this state it is ready to receive the shade required, by adding gamboge, annatto, or other tinging ingredients.

LACMUS, or LITMUS, (GER. Lackmus. DU. Lackmoes, Lacknoes. DA. Lackmus, Lakmos. SW. Lakmus. FR. Tournesol en pierre, en pâte, ou en pain, Orseille de Hollande. IT. Tornasole. SP. Tornasol de Holanda, en pastas. PORT. Tornesol de Holanda, ou em pastas. RUS. Lakmus. POL. Lakmus, Blekitna farba. LAT. Laccas musica,) a plant which yields a yellow dye-stuff; it is a species of moss usually found in the cavities of rocks, and in the hollows of sterile mountains; great quantities grow in Auvergne, in France, but it is generally brought to us from Holland, Genoa, the islands of Candia, and Teneriffe

LADANUM. See LABDANUM.

LADING, *Bill of*, is an acknowledgment signed by the master of a ship, and delivered to a merchant, proprietor, or factor of the goods. It contains an account of the articles received on board, and a promise to deliver them in good condition, at a certain port or place therein mentioned, for a specified sum. See title **BILL OF LADING**.

LADY-DAY, properly the day of the annunciation of "Our Lady," or the Virgin Mary, one of the festivals in the calendar. It is the 25th day of March, and one of, what are denominated, the quarter days; when rents are usually paid by tenants, for the occupation of lands and tenements, when notices to quit are given and received, when tenants quit farms, when dividends are paid upon stock at the Bank of England, and various other periodical occurrences take place among the agricultural, the commercial, and the monied classes of mankind in this country.

LAKES, certain colours made by combining the colouring matter of cochineal, or of certain vegetables, with pure alumine, or with oxide of tin, zinc, &c.

For the preparation of *Florentine lake*, the sediment of cochineal that remains in the bottom of the kettle in which carmine is made, may be boiled with about four quarts of water, and the red liquor left after the preparation of the carmine, mixed with it, and the whole precipitated with the solution of tin. The red precipitate must be frequently washed over with water. Exclusively of this, two ounces of fresh cochineal, and one of crystals of tartar, are to be boiled with a sufficient quantity of water, poured off clear, and precipitated with the solution of tin, and the precipitate washed. At the same time two pounds of alum are also to be dissolved in water, precipitated with a lixivium of potash, and the white earth repeatedly washed with boiling water. Finally, both precipitates are to be mixed together in their liquid state, put upon a filter and dried. For the preparation of a cheaper sort, instead of cochineal, one pound of Brazil wood may be employed in the preceding manner.

For the following process for making a lake from *madder*, the Society of Arts voted Sir H. Englefield their gold medal. Inclose two ounces troy of the finest Dutch madder in a bag of fine and strong calico, large enough to hold three or four times as much. Put it into a large marble or porcelain mortar, and pour on it a pint of clear soft water cold. Press the bag in every direction, and pound and rub it about with a pestle, as much as can be done without tearing it, and when the water is loaded with colour, pour it off. Repeat this process till the water comes off but slightly tinged, for which about five pints will be sufficient. Heat all the liquor in an earthen or silver

vessel, till it is near boiling, and then pour it into a large basin, into which a troy ounce of alum dissolved in a pint of boiling soft water has been previously put: stir the mixture together, and while stirring, pour in gently about 1½oz. of a saturated solution of subcarbonat of potash. Let it stand till cold to settle; pour off the clear yellow liquor; add to the precipitate a quart of boiling soft water, stirring it well; and when cold separate by filtration the lake, which should weigh half an ounce. Fresh madder root is equal, if not superior, to the dry.

Carmine is the finest of lakes. We shall not here say more upon this article, having already treated of it at sufficient length under its proper head.

LAMB-SKINS, (GER. *Lammshelle*. DU. *Lamsvellen*. DA. *Lammeskind*. SW. *Lammskinn*. FR. *Peaux d'agneaux*. IT. *Pelli Agnelline*. SP. *Pieles de Corderos*. PORT. *Pelle de Cordeiros*. LAT. *Agnorum Pelles*.) afford excellent leather for the formation of gloves, breeches, and even shoes, being usually pliant, and consequently capable of being worked into particular forms with great facility. Lamb-skins are, however, principally employed in their natural state, that is, with the wool on, in trimming gloves, covering muffs, and adorning different articles of dress. The skins whose wool is short and curly, are used in trimming gloves; those with thin, soft wool, are made into muffs; and such as are covered with close coarse wool resembling hair, are employed as furs. The price of lamb-skins varies according to the fineness, the brilliancy, and the colour of the wool. Black lamb-skins are more generally esteemed than those of any other colour. Our English lamb-skins are seldom to be met with perfectly black; but since the introduction of the Merino breed of sheep into this country, the white fleeces are, in point of quality, arrived at a pitch of perfection, which justly entitles them to be ranked with some of the best fleeces in Spain. In Piedmont, Lombardy, Tuscany, and other parts of Italy, the lamb-skins called *Turins* are to be met with. The fleeces of these are black, short, soft, and glossy. It is usual with the Italians to salt their lamb-skins for exportation, but this is highly improper, as such a process materially injures the fleeces; they ought invariably to be exported dry. The lamb-skins of Spain are black as well as white, and the fleeces are usually short and fine. Vast quantities of these skins are sent into France and Germany. In the latter country the peasantry use them as clothing, even in the fleece, and the women make them into under-petticoats, turning the woolly side inwards. The French lamb-skins are much of the same quality as the English, yet are frequently sold both in France and Germany as Spanish skins. The German and Russian lamb-skins differ very little from

the French; but the skins brought from Astracan, Tartary, and Persia are held in the highest estimation throughout Europe. The fleeces of Astracan are smooth, glossy, and black. They are used in the Levant for trimming caps, turbans, and other articles of dress. Those of Persia are close and curly, and are most valuable when of a greyish colour. The Poles purchase vast quantities of the Persian lamb-skins, which they employ in the manner of furs. The Persian skins of that description are called *slink lamb-skins*. This designation is given to them from the circumstance of their being cut out of the womb of the dam, before the natural period of gestation has elapsed. This cruel operation, which, of course, causes the death of the ewe, is said to be the chief cause of the repute which Persian lamb-skins have so long enjoyed; it is not, however, invariably practised by the sheep owners of Persia, who have another equally efficacious, and certainly less barbarous, mode of rendering their lamb-skins superior in quality to those of other nations. As soon as the lambs are yeaned, the shepherd wraps each of them up in a sort of swaddling-coat, which, at first, is tightly laced round the body of the animal, but loosened in proportion as it increases in size. This method, it is said, causes the fleece to curl and undulate, and renders it glossy, smooth, and fine. The fleeces of the Crim Tartarian lambs differ from the Persian, in being longer, not all curly, but merely undulated. The intrinsic value of these skins is very great, for they are extremely durable; their price is the same as that of the Persian skins, namely from 12 to 15 piastres. The lamb-skins of Astracan, Persia, and Crim Tartary are carried in immense quantities to the fairs of Leipsic and Frankfort, principally by the Jews who deal in furs. These are generally dry (being very rarely salted) when exposed to sale. Great discoveries have recently been made respecting the perfection to which the fleeces of the sheep in the northern States of the American Union may, with care, be brought; and experiments are now making in various parts, as well with the wool of the sheep, as with the skins of the lambs. The finest fleeces in the world however are those of the Shetland sheep and lambs. The texture of the thread made from the wool of the sheep is finer than that of silk, and the lamb-skins are proportionably delicate.

LAMMAS, a festival in the Romish church, holden on the first day of August, and celebrated in memory of St. Peter's imprisonment. It is not certainly ascertained whence it derived its appellation, but probably from some typical ceremony in which a lamb was introduced; for it is on record that the tenants of the church of York were bound by tenure to bring a lamb alive on this day into the church during high-mass.

It is one of what are denominated half-quarter days, when some servants hired at country statutes respectively enter upon, and quit, their services.

LAMP, (GER. and DU. *Lampen*. DA. *Lamper*. SW. *Lampor*. FR. *Lampes*. IT. *Lucerne*. SP. *Lamparas*. PORT. *Alampadas*, *Candeias*. RUS. *Lampadü*. POL. *Lampy*.) an instrument used for the combustion of liquid inflammable bodies, for the purpose of producing artificial light.

The most simple lamp consists of a vessel of almost any shape, containing oil or alcohol, with a tube projecting a little above the surface of the liquid, and containing any fibrous substance capable of raising the liquid to the top of the tube by capillary attraction. The oil thus raised, and diffused through the fibrous substance, is so detached from the main body of the liquid as to admit of being heated to a temperature sufficient to volatilize the oil, the vapour of which, in a state of combustion, constitutes the flame of the lamp. In the management of the lamp of the most simple kind, so far as relates to the supply of oil, three things must be attended to. 1. The wick must be of such a substance as best to promote capillary attraction. 2. It should not be twisted too much; in which case, its capacity for the oil is too little, nor should it be so loose as to diminish materially its capillary attractive power. 3. The distance of the flame from the surface of the oil. If the flame be too near the surface, a lesser quantity of oil will acquire the heat necessary to raise it into vapour; since the heat communicates with the fluid. On the contrary, when the flame is too high above the oil, the capillary attraction, which decreases in proportion to the distance, is insufficient to supply the necessary quantity of oil. Cotton is the substance best adapted for forming the wick. *

In the common lamp a portion of the oil is decomposed, and escapes in vapour without combustion; the disagreeable smell of this, and the quantity of smoke produced, formerly prevented lamps being generally used for domestic purposes, but this inconvenience has been remedied by the invention of the *Argand lamp*, the peculiar qualities of which may be thus explained.—In the common lamp, the combustible vapour occupying a considerable area, the oxygen of the atmosphere cannot combine with the vapour in the middle part of the ascending column; combustion consequently only takes place on the surface; the rest of the vapour is dissipated in the atmosphere; this is obviated in the Argand lamp by directing a column of air through the centre of the flame, which is raised from a circular instead of a solid wick, that surrounds the space through which the air ascends. The effect of this has been increased by placing a cylinder of glass, forming a bulb at the lower extremity, around the flame; by this con-

trivance, the ascending air is turned out of its direct course, and thrown on the centre of the flame.

An improvement in the method of raising the oil in the lamp was made by Mr. King, of Holborn, on the principle of the water-engine erected at Chremnitz, in Hungary. Some inconveniencies of this lamp, arising from the air in the upper part of the reservoir becoming dilated, forcing the oil over the sides of the vessel, have been removed by an invention of Mr. Peter Kier, of Kentish Town. The oil in this lamp is raised by the pressure of a denser liquid, not so liable to variety of expansion as air. The liquid used is a strong saline solution.

Some improvements have been made in this species of lamp by Mr. Baker, by which the necessary quantity of oil is raised by the heat produced by combustion. His lamp consists of a column of brass, or other metal, well closed every where excepting a small aperture at the bottom, in the middle of a little gullet or canal, in the upper part of which the wick is placed. Here the oil cannot get out, excepting as it is consumed by burning. This lamp has some inconveniencies, such as the air getting in by starts; and when the air in the cavities becomes too much rarefied, it drives out so much oil as sometimes to extinguish the lamp.

Safety-lamp.—Various attempts have been made, at different times, to construct a lamp, which might burn without danger in the explosive atmosphere, or inflammable gas, of coal mines. The first endeavour of this kind was by M. de Humboldt, in 1796; but his lamp being founded on the principle of entire insulation from the air, could only burn for a short time, till the air contained in it was exhausted. A lamp upon a similar plan, with respect to insulation, was contrived by Dr. Clanny, in 1813, but he supplied his light with air from the mine through water by bellows, and it went out in explosive atmospheres; besides which, it was necessary that it should be worked by the hand, or by machinery. It is obvious that neither of those lamps was adapted for the desired purpose. The great object was to find a means of obtaining light, which at the same time that it enabled the miner to work with security in the explosive atmosphere, (or *fire-damp*, as it is termed by the miners,) should likewise consume the fire-damp. This very desirable object was accomplished by Sir Humphrey Davy in the year 1815. We shall first give a description of the construction of his lamp, and then make some observations on the principles of its action. It consists of a cylindrical vessel for containing oil, made of copper rivetted together, or of massy cast-brass, or cast-iron, with a common tube for a cotton wick of the usual size; around this tube is a screw, adapted for receiving another screw attached to the interior part of a cylinder of wire-gauze.

The gauze cylinder may be composed of iron or copper wire; the wire should not be less than one-sixtieth of an inch in thickness, and it should be wove so as to contain 840 apertures in each square inch, which will be twenty-eight and thirty wires warp and woof. The upper part of this cylinder is received into another, (made in the same way,) for about two inches, which should fit closely, and extend about three inches above it, so as to form a second top. The upper extremities of the cylinders are closed with wire-gauze of the same dimensions as those of the sides; so that the only way by which the air can be admitted to the flame, is through the meshes of the gauze. The lamp is supplied with oil through a tube which enters on the side near the superior part of the oil vessel, and extends almost to the bottom; so that on removing the screw by which it is closed, to replenish it, no gas can be admitted to the flame. A small tube, just large enough to admit a wire, passes through the oil vessel from beneath to within the gauze cylinder; a piece of wire bent at the extremities is inserted through this, for the purpose of trimming the snuff of the lamp. The wire-gauze is surrounded by three pillars of strong wire passing from the oil vessel to above the cylinder, to prevent the latter being broken off by accident; and a ring is attached to the upper part of these wires, by which the lamp is usually suspended.

Sir Humphrey Davy, in his researches on the nature of flame, and the different degrees of heat which different substances require for their ignition, found that the fire-damp was not exploded or fired by red-hot charcoal or red-hot iron; it required iron to be white hot, and itself in brilliant combustion for its inflammation. He also found that it produced in burning comparatively a small degree of heat;—he likewise ascertained that carbonic acid and azote, formed by the combustion of the gas, and the transmission of the explosive mixture through small tubes, which he first employed, (these were afterwards changed for the wire-gauze,) lowered the temperature of the mixture so much, that it was no longer sufficient for its continuous inflammation. These facts led to an immediate result—the possibility of constructing a lamp, in which the cooling powers of the azote or carbonic acid, formed by combustion, and the cooling powers of the apertures, through which the air entered or made its exit, should prevent the communication of explosion. After trying various modes for its construction, he finally adopted that of which we have given a description.

The fire-damp of coal-mines consists of hydrogen gas mixed with a small proportion of carbon, and sometimes carbonic acid and azote. The presence of atmospheric air, or oxygen, is necessary for its combustion, and this takes place in different modes, according

to the different proportions in which they are combined. Sir Humphrey Davy found that when one part of fire-damp was mixed with one of air, they burnt by the approach of a lighted taper, but did not explode; two of air, and three of air, to one of gas produced similar results. When four of air and one of gas were exposed to a lighted candle, the mixture being in the quantity of six or seven cubical inches in a narrow-necked bottle, a flame descended through the mixture, but there was no noise: one part of gas inflamed with six parts of air in a similar bottle, produced a slight whistling sound: one part of gas with eight parts of air, rather a louder sound: one part with 10, 11, 12, 13, and 14 parts, still inflamed, but the violence of combustion diminished. In one part of gas and 15 parts of air, the candle burnt without explosion, with a greatly enlarged flame.

The next thing he endeavoured to ascertain, was the degree of heat required to explode the fire-damp mixed with its proper proportion of air. Well burned charcoal, ignited to the strongest red heat, did not explode any mixture of air and of the fire-damp: an iron rod at the highest degree of red heat, and at the common degree of white heat, did not inflame explosive mixtures of the fire-damp; but when in brilliant combustion, it produced the effect. When there is not a certain proportion of atmospheric air mixed with the fire-damp, the lamp becomes extinct; and this will take place although the mixture be fit for respiration. To remedy this inconvenience, Sir H. Davy added a coil of platina wire round the wick of the lamp, which becomes ignited in atmospheres containing but small proportions of atmospheric air, and the glow of the metal will continue to guide the miner; and by placing the lamp in different parts of the gallery, the relative brightness of the wire will show the state of the atmosphere in those parts. The ignition of the platinum takes place feebly in a mixture consisting of two parts of air and one of fire-damp, and brilliantly in a mixture consisting of three of air and one of gas. By increasing the proportion of air, it soon lights the flame in the cylinder, which, by the addition of more atmospheric air, rekindles the flame of the wick. This phenomenon, although it may take place in experiments with gases in a room, we have been informed has not succeeded in mines. The greater degree of coldness of the situation, and the draughts of cold gas about the mines, soon extinguishes the platinum wire, when that alone is ignited. We should mention this fact, that the atmosphere in which the platinum wire will continue ignited may be breathed with safety for a considerable time.

The use of having the cylinder double at the top, is to prevent the danger of explosion on that part of the cylinder becoming red or

white hot, which it does under certain circumstances. When a current of explosive atmosphere is poured on a lamp, the heat of the wire becomes greater than in ordinary circumstances. This is to be remedied by increasing the cooling surfaces, or by diminishing the current of the air. For the former purpose a cylinder of twilled gauze is used. The common wire-gauze with a double cylinder, or with a reflector, answers the same purpose.

The discoveries of Sir H. Davy respecting the nature of ignition, and the circumstances under which fine platina wire will continue in that state, has lately been applied to the construction of a lamp which burns without flame, which may be of considerable use for a variety of purposes. It consists of a common spirit lamp, with a cotton wick of the usual size, round which a coil of about 12 turns of platina wire, the 100th part of an inch in diameter, is placed, so that about seven turns of the wire are around the cotton, and five above it. The cotton is to be lighted, and suffered to burn for a minute, when it is to be extinguished; the platina wire immediately becomes red-hot, and continues to burn, by the vapour of the spirit, as long as any remains in the lamp. The ignited wire affords sufficient light to distinguish the hour on a watch by, and will light a brimstone match when applied to it.

The ancients are said to have been possessed of the means of making lamps which would burn perpetually without attention, and many such have been said to have been found in sepulchres, which had not been opened for fifteen or sixteen centuries; but it has been thought by some that they took fire at the instant of the admission of the air. Dr. Plott was of opinion, that the making of perpetual lamps was practicable; and himself made some proposal for the execution of a lamp of this kind. Asbestos, he considered would serve for the wick, and that the *naphtha*, or liquid bitumen, which spontaneously and constantly springs from various parts of the earth, might serve for fuel.

Lamps which take fire on the admission of the air, are made by inclosing a piece of phosphorus in a vessel exhausted of air, on the admission of which, combustion of that substance takes place.

LAMP-BLACK. (GER. *Kienruss*. DU. *Zwartzel*. DA. *Könrög*. SW. *Kimrök*. FR. *Noir de fumée*. IT. *Nero di fumo*, *Negro-fumo*. SP. *Negro de humo*. PORT. *Ferrugem da chaminé*. RUS. *Sasha*. POL. *Sadz*. LAT. *Fuligo*.) Under the word **BLACK**, *Lamp*, we gave an account of this article, to which we shall only here add, that there are two kinds of it in common use; the best is that procured either from the burnings of the wood of the pine and other resinous trees, or by the methods pointed out in the article to which we refer; the inferior kind is a

heavy black prepared from bones by calcining them in close vessels.

LANCETS, (GER. *Lanzetten*. DU. *Laa-tyssers*. DA. *Lanzetter*. SW. *Lansetter*. FR. *Lancettes*. IT. *Lancette*. SR. *Lancetas*. PORT. *Lancetas*. LAT. *Scalpella*.) highly polished and sharply pointed chiralurgical instruments made of steel. There are usually three or four lancet-blades set in a single handle, in order that the operator may have a ready choice of instruments upon any sudden emergency. Lancets are made in the highest perfection at London, whence several celebrated practitioners in various parts of Europe procure their instruments.

LAND, in the sea-language, makes part of several compound terms: thus *land-laid*, or to lay the land, is just to lose sight of it.

Land-locked, is when the land lies all round the ship, so that no point of the compass is open to the sea: if a ship be at anchor in such a place, she is said to ride land-locked, and is therefore concluded to ride safe from the violence of the winds and tides.

Land-mark, any mountain, rock, steep, tree, &c. that may serve to make the land known at sea.

Land is shut in, a term used to signify that another point of land hinders the sight of that the ship came from.

Land-to, or the ship lies land-to, that is, she is so far from shore that it can only be just discerned.

Land-turn, is a wind that in almost all hot countries blows at certain times from the shore in the night.

To *set the land*, that is, to see by the compass how it bears.

LANDED, *Goods until safely*. See **INSURANCE**.

LANDLORD and **TENANT**. If a landlord give a legal notice to his tenant to quit the premises at the expiration of the time for which they are holden, and such tenant hold over, he will subject himself to an action of debt, for double the value of the rent, and if he hold over after his own notice he will also be liable.

Where a tenant, whose lease is expired, is permitted to continue in possession, pending a treaty for renewal of his lease, he does not thereby become a yearly tenant, unless rent has been received; but is so much a tenant at will, that he may be turned out without notice.

Where, at the end of the year, a landlord accepts one tenant in the room of another, such acceptance dispenses with notice to quit.

Where executions are levied, the landlord is entitled to a year's rent if due: he cannot, however, in this case distrain, but must give notice to the sheriff.

An under-tenant cannot discharge himself of the rent due from him to his immediate landlord, by a voluntary payment of rent to the superior; but he may do it under the

coercion of a threatened distress, and in that mode only.

If a lessor covenant to repair, and does not, the lessee may do so; and to an action of debt for rent he may plead the lessor's covenant to repair, and that he laid out the rent in pursuance of such covenant.

Notice by the Landlord to his Tenant.

Sir,

I hereby give you notice to quit the premises which you hold of me, situate as—, in the county of—, on or before the — next

Your's, &c.

(the date)

(the landlord.)

To —, (the tenant in possession.)

Notice to quit by the Tenant.

Sir,

I hereby give you notice, that on the — day of —, I shall quit possession of the messuage or tenement, and premises which I now hold of you, situate at —, in the parish of —, in the county of —, dated this — day of —.

Your's, &c.

To — (landlord) — (tenant.)

Notice to the Tenant either to quit the Premises, or pay double Rent.

Sir,

I hereby give you notice to quit and yield up, on or before the — day of — next, possession of the messuage, with its appurtenances, lands, tenements, and hereditaments, which you now hold of me, situate at —, in the parish of —, and county of —; or in failure thereof, I shall require and insist upon double the value of the said premises, according to the statute in such case made and provided.

To — (tenant.) — (landlord.)

Such, and the like, are the usual notices to be given on common occasions, and those are all which it has been thought convenient to give. See **BROKER**.

LAND-MARK. See **LAND**.

LAND-SURVEYOR, a person who is employed in measuring land, and in laying it out in gardens, fields, plantations, streets, lots, &c. See **SURVEYING**.

LAND-TAX, an ancient branch of the public revenue, the origin of which may be traced to the fines or commutations for military service, levied during the feudal system under the name of scutages. These are supposed to have been at first mere arbitrary compositions, as the king and the persons liable could agree; but the practice having been much abused, it was declared by *Magna Charta*, and afterwards repeatedly confirmed by acts of parliament, that no scutage should be imposed without the consent of the great men and commons, in parliament assembled. This tax was sometimes exacted under the name of hydage, or carrucage; but taxes on land came afterwards to be generally denominated subsidies, or assessments. During the commonwealth, taxes on land were

evied by monthly assessments; and commissioners were appointed in each county for rating the individuals. These assessments varied according to the exigencies of the times, from 35,000*l.* to 120,000*l.* a month; the assessments in Scotland were commonly 6000*l.* but sometimes 10,000*l.* a month; in Ireland 9000*l.* a month. This mode of raising money was found so productive, that with some little variations it has, under the denomination of land-tax, ever since formed an important branch of the revenue.

The land-tax, till lately, differed from all the other branches of the public revenue, (except part of the duties on malt), in being imposed annually, whereas other taxes have been granted either for a term of years, or, more commonly of late years, for ever; but though granted for only one year at a time, it has been regularly continued from year to year since the Revolution, having never been wholly taken off: but it has varied with respect to the rate at which it has been imposed, having been usually reduced during peace, and increased again in time of war, to answer, in part, the increased expenditure. In 1693 it was first raised to four shillings in the pound, upon a valuation returned in the preceding year, and according to which it has continued to be raised to the present time.

The sums to be raised at 4*s.* in the pound were stated, in the annual act, at 1,989,673*l.* 7*s.* 10½*d.* for England, and 47,954*l.* 1*s.* 2*d.* for Scotland, making together 2,037,627*l.* 9*s.* 0½*d.*; and upon credit of this assessment 2,000,000*l.* were annually borrowed of the Bank, in anticipation of the tax, for which sum exchequer-bills were given them, which were to be discharged out of the produce of the tax as it came in; but the full amount of the assessment was seldom, if ever, collected, so that the net payments into the exchequer always fell short of the sum borrowed on the credit thereof, exclusive of interest on the bills, and the deficiency was made good out of the supplies for the next year.

In 1798, the current value of the public funds having been unusually depressed for some time past, and apprehensions being entertained that the further increase of the funded debt would be attended with peculiar inconvenience, unless some mode was discovered of counteracting its effects, a project was adopted of offering the land-tax for redemption, by sale. With this view an act was passed, making the land-tax a perpetual tax, from 25th March, 1799; and being thus converted into a permanent annuity, it was offered for sale to the proprietors of the lands upon which it was charged; or if they declined it, to any other person who chose to become a purchaser. In the first case it was considered as a redemption of the tax, the estate becoming in future wholly freed from it; in the latter case the purchaser became entitled to receive the land-tax regularly from

the receiver-general, half-yearly, on the 16th of March and 20th of September in every year. The consideration to be given in either case was not to be in money, but stock, either in the three per cent. consols, or three per cent. reduced, to be transferred to the commissioners for the reduction of the national debt. The quantity of stock to be transferred for redemption of the tax by persons interested in the land on which it was charged, was so much capital as yielded an annuity or dividend exceeding the amount of the tax to be redeemed by one-tenth part thereof; and the stock to be transferred for purchase of the tax by persons not interested in the land, was so much capital as yielded an annuity or dividend exceeding the tax to be purchased by one-fifth part thereof. Thus the amount of three per cent. stock to be transferred for 10*l.* per annum tax was 366*l.* 13*s.* 4*d.* for redemption, or 400*l.* for purchase.*

This scheme was adopted with the view of facilitating the raising of money on loan, by absorbing a large quantity of floating stock, and thus raising the current price; while at the same time it would be attended with an increase of value. This at least was the avowed object of the measure, which it was estimated would be the means of redeeming or taking out of the market about 80,000,000*l.* of stock; the advantages offered by it were, however, by no means such as to induce a general approval of it. The period first limited was several times extended, but the plan still succeeded imperfectly. Almost every session of parliament, produced some new attempt to accomplish the object, by facilitating the means of carrying it into execution. At length the 53 Geo. 3. c. 123. was supposed to have brought the system to perfection by altering, amending, extending, or repealing, all the objectionable clauses in the previous acts. This statute invested the commissioners for the affairs of taxes with all the powers that had been previously given to special commissioners for the sale and redemption of the land-tax, and constituted two a sufficient number to act; the preference previously given to certain bodies and persons in possession was revoked, and the opportunity of purchasing was laid open, with no other preference to any but by priority of contract. The consideration was allowed to be paid by half-yearly instalments in sixteen years, with various other indulgences. The commissioners were also directed to circulate printed forms of notices of the various modes of redemption, and printed forms of declaration for persons who were desirous of redeeming. Many facilities were also given to incumbents, as well as patrons, of ecclesiastical preferments, to become purchasers of

Lastly came 54 Geo. 3. c. 173. which ordains a special commission for the sale and redemption of land-tax in the case of bodies

politic, for charitable or other public purposes, or of lands, tenements, &c. in which the crown has any interest. It gives power to exonerate small livings, and charities not exceeding 150*l.* per annum; encourages the purchase of land-tax, of livings in the patronage of corporate bodies, and makes further regulations with respect to the application of trust monies in their hands for that purpose. The laws relating to the receivers of the land and assessed taxes, are amended by 3 Geo. 4. c. 88. The provision for poundage is thereby done away with, and no salary to any receiver-general is to exceed 600*l.* per annum.

LAND-WAITER, an officer of the custom-house, whose duty it is, upon landing any merchandise, to taste, weigh, measure, or otherwise examine the various articles, &c. and to take an account of the same. They are likewise styled searchers, and are to attend, and join with, the patent-searchers in the execution of all cockets for the shipping of goods to be exported to foreign parts; and, in cases where drawbacks or bounties are to be paid to the merchant on the exportation of any goods, they, as well as the patent-searchers, are to certify the shipping thereof on the debentures.

LANTERNS, (*GER.* *Lanternen.* *DU.* *Lantaarnen.* *DA.* *Laterner, Lögter.* *SW.* *Laternor, Lycktor.* *FR.* *Lanternes.* *IT.* *Lanterne.* *SP.* *Linternas.* *PORT.* *Lanternas.* *RUS.* *Fonari*), transparent cases for holding candles, &c. in. There are various sorts of lanterns, such as tin pierced in a variety of forms; tin and transparent horn; glass framed in lackered tin; and dark lanterns, the light within which may be concealed or displayed at pleasure by means of a moveable shade.

LAPIDARY, or **LAPIDIST**, is a person who deals in precious stones, gems, &c. There are various machines used in the cutting of precious stones, according to the quality; the diamond, which is extremely hard, is cut with diamond-dust tempered with olive-oil, on a wheel of soft steel, turned by a mill. The oriental ruby, sapphire, and topaz, are cut on a copper wheel with diamond-dust, tempered with olive-oil, and are polished on another copper wheel with tripoli (rotten-stone) and water. The hyacinth, emerald, amethyst, garnet, agate, and other stones, not of an equal degree of hardness with the others, are cut on a leaden wheel with emery and water, and polished on a tin wheel with tripoli. The turquois of the old and new rock, girasol, and opal are cut and polished on a wooden wheel with tripoli.

LAPIS CALAMINARIS. *See* CALAMINE.

LAPIS LAZULI, a sort of stone from which that celebrated colour, *ultramarine*, is made. It is found in many parts of the world, but that of Asia and Africa is much superior to that of Germany. It is to be chosen heavy,

of a fine, close texture, and of a deep indigo blue colour, with a little white matter about it, and with as few of the ornamental gold-coloured veins in it as possible, and such as, when put into the fire, calcines without emitting any smell.

In a strong fire, lapis lazuli melts without any addition, into a fine white glass. *See* **ULTRAMARINE.**

LARBOARD, among seamen, the left-hand side of the ship, when you stand with your face towards the head.

LARCENY, in the law of England, is a *felonious* taking away of the personal goods of another. It is divided into *grand larceny*, and *petit larceny*: the former term applies where the goods taken are *above* the value of 12*d.*, the latter where they are *under* that value. *Grand larceny* incurs a forfeiture of life and lands, *petit* of personal property only, and the additional punishment of transportation, or whipping, and imprisonment. This is however only a *general* description of the offence and its punishments, for there are divers statutes, describing particular sorts of larceny, and annexing specific punishments to each description. 4 *Black. Com.* 228.

LARCH, a tree valuable for its timber, which has lately been cultivated with particular attention in this country.

Where durability and strength are required, the larch is of singular utility. Hence it is peculiarly calculated for masts of ships, or for strengthening the wooden frame-work of bridges, as it will support a much greater weight than the oak itself, and almost petrifies under water.

No wood affords such durable pipe-staves for casks, as the larch, while the flavour of the wine is at the same time preserved and improved.

The bark, and other parts of this tree, have been found by experiments to be proper substitutes for that of the oak in tanning.

LARD, *Hogs'*, (*GER.* *Schweinesmalz.* *DU.* *Reuzel.* *DA.* *Svineister.* *SW.* *Svinister.* *FR.* *Saindoux.* *IT.* *Sugna di porco.* *SP.* *Manteca de puerco.* *PORT.* *Manteiga, Unto ou Banha de porco.* *RUS.* *Swinoe saloe.* *POL.* *Sadło swine.* *LAT.* *Auxungia porci*), the fat of swine melted; it is chiefly used in pharmacy, in the composition of plasters, pills, &c. or for culinary purposes. Large quantities of this article are imported from Ireland, and sent from that country to different parts of the world, especially to Spain and Portugal, where it is used as a substitute for butter.

LARRES, money used in the Maldives, of which five are equal to a dollar, or 4*s.* 6*d.* sterling.

LAST, an uncertain quantity, varying with respect to particular articles. The following quantities of different articles make a last, viz. :

Fourteen barrels of pitch, tar, or ashes, 23 Hen. 8. c. 14.

Twelve dozen of hides or skins, 1 Jac. 1. c. 23.

Twelve barrels of cod-fish, potash, or meal, 5 Car. 2. c. 7.

Twenty cades, or one thousand herrings, every thousand ten hundred, and every hundred five score.

Ten quarters and a half of cole-seed.

Ten quarters of corn or rape-seed; in some parts of England twenty-one quarters of corn to the last.

Twelve sacks of wool.

Twenty dickers (every dicker twelve skins) of leather.

Eighteen barrels of unpacked herrings.

Ten thousand pilchards.

Twenty-four barrels (each barrel containing 100 lbs.) of gunpowder.

One thousand seven hundred pounds of feathers or flax.

Last, is sometimes used to signify the burden or lade of a ship.

LASTAGE, the sand or ballast laid at the bottom of a ship, or vessel, to keep her steady.

It is also the custom paid for freightage, on herrings, pitch, tar, ashes, &c.

LATCHES, or **LASKERS**, in a ship, are small lines like loops, fastened, by sewing, into the bonnets and drablers, in order to lace the bonnets to the courses, or the drablers to the bonnets.

LATCHES, (*Door-latches*. GER. *Thürk-linkin*. DU. *Klinken*, *Deurklinken*. DA. *Dörklinker*. SW. *Klinkor*. FR. *Loquets*. IT. *Saliscendi*. SP. *Pasadores*. PORT. *Linguetas*.) catches or doors made of iron, and usually japanned over, to keep them from rust. They are manufactured at Birmingham, Walsal, Wolverhampton, and in the vicinities of these towns.

LATH, (*Laths*. GER. and DU. *Latten*. DA. *Lægter*. SW. *Lückter*. FR. *Lattes*. IT. *Correnti*. SP. *Latas*, *Ripias*. PORT. *Ripas*. RUS. *Slegü*. POL. *Laty*.) in building, a long, thin, and narrow slip of wood, nailed to the rafters of a roof or ceiling, in order to sustain the covering. Laths are distinguished into three kinds, according to the different kinds of wood of which they are made, viz. heart-of-oak, sap, and deal laths; of which the two last are used for ceilings and partitions, and the first for tiling only. Laths are also distinguished according to their length, into five, four, and three-foot laths, though the statute allows but of two lengths, those of five and of three feet, each of which ought to be an inch and a half in breadth, and half an inch in thickness, but they are commonly less.

Laths are sold by the bundle, which is generally called a hundred, but seven score, or 140, are computed in the hundred for three-foot laths; six score, or 120, in such as are four feet; and for those which are deno-

minated *five-feet*, the common hundred, or five-score.

LATH-BRICKS, a particular species of brick made in Staffordshire and other parts of Britain; they are twenty-two inches in length, and six in breadth, being used as a substitute for laths or spars, and supported by pillars on carts for the drying of malt.

LATHE, the tool of a turner, by which he turns about his work so as to shape it by the chisel. There are various kinds of lathes, and of late years many important improvements have been made in the construction of these useful machines. Some require the aid of one or two men to turn their wheels; but in that which is most commonly used, the wheel is turned by means of a treadle, which may readily be kept in motion by the person employed in turning the work. The piece to be turned should be rounded, either with a small hatchet or a plane, before it is put on the lathe. In fixing a lathe, great care should be taken that it be placed in a light situation near a window, and neither so low as to oblige the workman to stoop in order to see his work, nor so high that the chips should come into his eyes.

LATITUDE, the distance of any place from the equator, measured upon the meridian in degrees, minutes, and seconds: all places lying under the equator are said to have no latitude; and all others to have north, or south, latitude, according to their situation with respect to the equator. The complement of latitude is the difference between the latitude itself and 90°, or as much as the place itself is distant from the pole; and this complement is always equal to the elevation of the equator above the horizon of the place. The elevation of the pole of any place is equal to the latitude itself.

LATTEN, denotes iron plates tinned over, of which tea-cannisters, &c. are made.

There is likewise a species of latten composed of copper and calamine, the goodness of which depends, in a great measure, upon the quality of the calamine employed in its composition. This kind of latten is chiefly used by clock-makers, and vast quantities of it are made into latten-wire, which, being extremely flexible, is of considerable utility in various branches of the mechanical arts. Abundance of latten is made at Aix-la-Chapelle, and in different parts of Germany. It comes to us from the latter country in thin leaves scratched or streaked on one side, and quite black on the other. These leaves are sometimes made up in rolls, or doubled together, whence they are called roll-latten. The German latten is employed with success in the process of plating buttons.

LATTEN-BRASS, (GER. *Messingbleck*, *Latun*. DU. *Mistingblek*, *Latoen*. DA. *Messingblik*. SW. *Messingsbleck*. FR. *Lame de laiton*. IT. *Lamiera d'ottone*. SP. *Laton en*

hojas on planchas. PORT. *Lata.* RUS. *Latun*.) plates of milled brass, reduced to different thicknesses, according to the uses it is intended for.

LATTIMO, a name for a fine milk-white sort of glass, made of crystal frit, calcined tin, and prepared manganese.

LAVA, the fused stony substance which issues from volcanoes. Of this there are many varieties, according to their component ingredients. The purposes to which it is applied are scarcely less diversified. The large masses have been used in the vicinity of the volcanoes for erecting the walls of buildings, and for pavements. Mill-stones are made of the lava of Mount Etna, which are exported to Calabria, Malta, and elsewhere. Cannon-balls are not unfrequently made of it, and of some small beautiful pieces snuff-boxes and other toys are manufactured.

LAVATORYS, or **LAVADEROS**, certain places in Chili and Peru, where gold is got from the earth by means of washing. Where gold is expected to be found, those employed dig deep into the earth, and so turn a stream upon the spot to facilitate this design. When they arrive at the earth they want, they turn off the stream and dig dry. They now place what earth they dig up in a basin, formed like a smith's bellows, into which a little rivulet runs with great rapidity, dissolving the earth, and carrying every thing away except the gold, which, by its weight, precipitates to the bottom, and mixes with a fine black sand.

LAUDANUM, in pharmacy, a name given to divers preparations of opium, chiefly in a liquid form. See **OPIUM**.

LAVENDER. (GER. *Du. Da.* and *Sw. Lavendel.* FR. *Lavande.* IT. *Lavendola, Lavanda, Spigo.* SP. *Espliego, Alhucema, Lavandula.* PORT. *Alfazema, Lavanda.* RUS. *Lavendul.* POL. *Lavanda.* LAT. *Lavandula, Spica*.) The species of this plant are seven in number. The *spica*, or *spike lavender*, has a short shrubby stalk. The varieties of this are, common narrow-leaved lavender, with blue flowers, and with white flowers; broad-leaved lavender; dwarf lavender; all of them flowering in July. This species is the common lavender; but the narrow-leaved variety, with blue flowers, is the sort commonly cultivated for its flowers for medicine.

The water drawn from the flowers of lavender by distillation, is esteemed a fine perfume, and whether as a scent or a lavatory, is accounted an excellent remedy against slight pains of the head.

LAVENDER-THRIFT, or **SEA-LAVENDER**. This vegetable, which is a perennial plant, growing on the sea-shore, deserves the particular attention of tanners, on account of its red astringent root, called by the Russians *kermeeck*, and from which they prepare that valuable kind of leather, dis-

tinguished for its strong, but by no means disagreeable odour, and on the continent termed *juften*. This root is said to be a complete substitute for oak-bark.

LAUNCH, in the sea language, signifies to put out: as, "launch the ship," that is, put her out of the dock; "launch aft," or "forward," speaking of things that are stowed in the hold, is put them more forward; "launch, ho!" is a term used when a yard is hoisted high enough, and signifies hoist no more.

LAUNDER, among miners, a place where they wash the powdered ore.

LAW. Laws of England are divided into *lex non scripta*, or the common law; and *lex scripta*, or statute law.

The *lex non scripta* is not so called from its being conveyed down from former ages by word of mouth, but because the original authority of these laws is not set down in writing, and they receive their force by long usage, and by their universal reception throughout the kingdom; and it is curious to observe, that these rude maxims of our ancestors, of which no person knows clearly the origin, exceed in clearness, brevity, and authority, all that the united wisdom of the most enlightened men have produced in later ages. 1 *Black. Com.* 63.

The common law is divided into,

1st. General custom, which is the universal rule of the whole kingdom, and is the law by which proceedings and determinations in the courts of justice are ordinarily directed. This for the most part settles the course of inheritance, the manner and form of acquiring and transferring property, the solemnities and obligations of contracts, the rules of expounding wills, deeds, and acts of parliament; the remedies of civil injuries, the different kinds of offences with the punishments allotted to each; the institution of four superior courts of record; and many other particulars which diffuse themselves as extensively as the distribution of common justice requires, all of which are not enacted by any particular statutes (though they are acknowledged by all) but depend entirely upon the common law.

2dly. Particular customs which concern the inhabitants of some particular district.

3dly. The third branch are those laws which are adopted by certain courts and jurisdictions, as the civil, and canon, laws.

The second division of the laws of England are the statutes made by the king, lords, and commons, assembled in parliament. The oldest statute extant is the celebrated *Magna Charta*, 9 Hen. III. though, doubtless, the records of many antecedent to that have been lost, and the maxims received as common law.

Statutes are general, or special; public, or private: general or public acts are those which concern the whole nation; of these the judges are obliged to take notice, though

they should not be formally pleaded by the party who claims an advantage under them. Special or private acts are such as operate on private persons and concerns, which must be formally set forth by the party, or the judges are not obliged to notice them.

In treating of the laws, the best mode, and that which has been adopted by Sir W. Blackstone in his excellent Commentaries, is to divide them, 1st, into the rights of persons, or the rights as to personal security, personal liberty, and private property. 2d, The rights of things, or the rights which a man may acquire in and to such external things as are unconnected with his person. 3d, Private wrongs, or such as are the infringement of the private rights of individuals: and 4th, Public wrongs, or such as are a violation of the public rights, and affect the whole community.

It is of course unnecessary, and perhaps in a work of this nature irrelevant, to recommend the study of the law; it is sufficient to add the words of the great judge Blackstone on this subject. "It is incumbent," says he, "upon every man to be acquainted with the laws, lest he incur the censure, as well as the inconvenience, of living in society without knowing the obligations it lays him under."

LAW OF MARQUE, (mentioned in stat. 27 Edw. 3. st. 2. c. 17.) from the German word *march*, i. e. *limes*, a bound or limit; because they that are driven to make use of this law, do take the shipping or goods of that people of whom they have received wrong, and cannot get ordinary justice, when they can take them within their own bounds or precincts. See **LETTERS OF MARQUE**.

LAW-MERCHANT, (*Lex Mercatoria*,) is also a part of the laws of this realm. The *lex mercatoria*, or the custom of merchants, like the *lex et consuetudo parliamenti*, describes only a great division of the law of England. The laws relating to bills of exchange, insurance, and all mercantile contracts, are as much the general law of the land, as the laws relating to marriage or murder. But the expression has frequently led merchants to suppose, that all their new fashions and devices immediately become the law of the land: a notion which, perhaps, has been too much encouraged by the courts. Merchants ought to take their law from the courts, and not the courts from merchants: and when the law is found inconvenient for the purposes of extended commerce, application ought to be made to parliament for redress. This is agreeable to the opinion of Mr. Justice Foster, who maintains, that "the custom of merchants is the general law of the kingdom, and therefore ought not to be left to a jury after it has been settled by judicial determinations." 2 Bur. 1226.

By the **CIVIL LAW**, absolutely taken, is generally understood the civil or municipal

law of the Roman empire, as comprised in the institutes, the code, and the digest of the emperor Justinian, and the novel constitutions of himself and some of his successors.

This consists of, 1. The institutes, which contain the elements or first principles of the Roman law, in four books. 2. The digests, or pandects, in fifty books, containing the opinions and writings of eminent lawyers, digested in a systematical method. 3. A new code, or collection, of imperial constitutions, in twelve books; the lapse of a whole century having rendered the former code of Theodosius imperfect. 4. The novels or new constitutions, posterior in time to the other books, and amounting to a supplement to the code; containing new decrees of successive emperors, as new questions happened to arise. These form the body of the Roman law, or *corpus juris civilis*, as published about the time of Justinian; which, however, fell soon into neglect and oblivion, till about the year 1150, when a copy of the digests was found at Amalfi in Italy: which accident concurring with the policy of the Roman ecclesiastics, suddenly gave new vogue and authority to the civil law, introduced it into several nations, and occasioned that mighty inundation of voluminous comments, with which the system of law, more than any other, is now loaded. 1 Black-81.

The **CANON LAW** is a body of Roman ecclesiastical law, relative to such matters as that church either has, or pretends to have, the proper jurisdiction over. This is compiled from the opinions of the ancient Latin fathers, the decrees of general councils, and the decretal epistles and bulls of the holy see. All which lay in the same disorder and confusion as the Roman civil law: till about the year 1151, one Gratian, an Italian monk, animated by the discovery of Justinian's pandects, reduced the ecclesiastical constitutions also into some method, in three books; which he entitled *concordia discordantium canonum*, but which are generally known by the name of *decretum Gratiani*.

LAW OF THE STAPLE, (mentioned in stat. 27 Edw. 3. st. 2. c. 22.) is the same with law-merchant.

LAWN, (GER. *Du. Sw.* and *Fr. Linon*. *Da. Sindal*, *Linon*. *It. Linone*, *Rensa*. *Sr. Cambray clarin*. *Port. Cambraia transparente*,) a sort of clear or open worked cambric, which, till of late years, was exclusively manufactured in France and Flanders. At present, the lawn-manufacture is established in Scotland, and in the north of Ireland, where articles of this kind are brought to such a degree of perfection, as nearly to rival the productions of the French and Flemish manufactories. In the manufacture of lawns, finer flaxen thread is used than in that of cambric. In Picardy, the warp of lawn is framed at 16½ yards, and is about 15½ yards in length when completed. The

breadth of the lawn is about two-thirds. There are also some lawns made in France and Flanders, the length of which is $15\frac{1}{2}$ yards, and their breadth three-fourths. The mode of manufacturing broad lawns is by no means different from that employed in making the narrow, except that the number of threads put in the warp is augmented in proportion to the breadth of the piece. Striped and spotted lawns are made precisely of the same dimensions as the plain ones, of which we have just been speaking; the only difference between the two processes is, that, in order to form the stripes and spots, thick cotton is interwoven in the warp. France carries on a most extensive trade in the article of lawns, which she exports in vast quantities to Spain, Germany, Holland, and (clandestinely) to Great Britain. The greater part of the lawns manufactured in the British dominions is consumed at home.

LAWNS, Silesian. (GER. *Schleyer, Estopilles*. SP. *Estopillas*. PORT. *Estopilhas*. FR. *Estopilles*.) These lawns are made in Silesia, a province of the king of Prussia, on the same plan as those of France and Flanders; they are, however, not equal to the latter in point of fineness, though the pieces are much larger, each being 58 yards in length, when first manufactured, but cut into smaller pieces for the purpose of being exported. We import large quantities of Silesian lawns. The flax from which they are made is usually procured by the Silesians from Russia, which country, in return, annually buys up considerable quantities of the linen, lawn, &c. of Silesia.

LAZARETTO, is the name of institutions formed in various parts of Europe, for the purpose of preventing the introduction of pestilential diseases into those countries whose happy climates do not spontaneously generate destructive maladies. Italy and France have the finest establishments of this description; but the Lazaretto of Marseilles (a well-known French port, situated upon the Mediterranean) is certainly superior to all the others. This lazaretto, or pest-house, was originally established for the purpose of preventing the contagion of a dreadful endemic disease, which ravages the ports of the Levant and most parts of Barbary, from being introduced into France. This terrible malady, in the year 1720, eluded the vigilance of the governors of Marseilles, and entering France, afforded such a tremendous lesson to the administration, that hitherto no cares, no circumspection, have been spared or neglected to prevent the recurrence of the dreadful calamity. The Lazaretto is sufficiently distant from Marseilles, to render it entirely distinct from that town, and yet not so remote as to occasion attendance on it either difficult or inconvenient. Its extent is equal to that of many large cities of France; it is surrounded by a double inclosure, the walls that constitute which be-

ing so high, and so distant one from the other, that the most nervous arm could not possibly fling a packet, however small, beyond the external wall. The police of the Lazaretto is superintended by the conservators of health, and executed under their auspices by a captain who resides within the institution, and who employs several inferior officers and servants to attend to the mooring of the shipping, landing of the goods and passengers, &c. Bales and packages of every sort are opened with the utmost caution under sheds, erected in the Lazaretto, which are open on every side, in order to the free circulation of the air. Here they are suffered to lie till they are supposed to be free from every particle of contagion. Within the Lazaretto there are apartments, both roomy and commodious, for the reception of the passengers, who continue there till the term of their quarantine is expired. There is no institution of this kind in England, or in any part of Great Britain; yet our quarantine regulations are just as well calculated to insure us from infection, as if every one of our ports had its Lazaretto. See QUARANTINE.

LAZZI. We derive many words of our language from our Saxon ancestors, as it is reasonable to suppose we must; but few, or none, applying to commercial subjects, as commerce was almost unknown to them. *Lazzi* (by corruption *lazy*) was the term by which they distinguished the inferior orders of society, who were indeed then chiefly in a state of slavery, and affixed to the lands where born. The next in order in the ascending scale were the freemen, whom they distinguished by the name of *Frilingi*; and the highest were styled *Edilthingi*, by which were intended the nobles. It was not till long after the Norman conquest that a fourth order in the state, that of the merchants, arose; and it was still longer after that event, before they became of sufficient importance to claim much attention from the legislature, or to have its protection extended to their concerns. Till the time of king Edward III. the external commerce of the kingdom was in the hands of foreigners, and it was not even till an advanced period of that king's reign that any laws were enacted for its advancement and protection. See title SHIPPING AND TRADE.

LEA, a measure used in some parts of England to express a certain quantity of yarn; thus a lea of yarn at Kidderminster must contain 200 threads on reels that are four yards in circumference.

LEAD, (GER. *Bley, Blei*. DU. *Lood, Loot*. DA. *Bly, Blye*. SW. *Bly*. FR. *Plomb*. IT. *Piombo*. SP. *Plomo*. PORT. *Chumbo*. RUS. *Svinetz*. POL. *Olow*. LAT. *Plumbum*.) one of the perfect metals. It is of a dull white, inclining to a blue colour; and although the least ductile and sonorous, it is

the heaviest of metallic bodies, excepting mercury, gold, and platina.

When the lead ore is dug out of the earth, it is crushed in a mill, and smelted in a manner similar to iron ore.

Lead is employed in making various vessels, as cisterns for water, large boilers for manufacturing chemical purposes, and is cast into sheets for covering buildings, making water-pipes, &c. Considerable quantities are likewise used in the casting of shot: it unites with almost every metal except iron and copper; but if both metals are exposed to the fire in a proper vessel, the latter will become scarified by the former, and melts with the calx into a dark coloured glass. On account of its vitrifying the imperfect metals, lead is often used in the purification of gold and silver, neither of which combine with it, but remain pure at the bottom of the vessel.

This metal is found abundantly in many parts of the world, more especially in England, Wales, Scotland, France, Germany, Russia, Sweden, Prussia, Poland, some parts of the East Indies, as well as in North and South America. The principal lead-mines of England and Wales are situated in the counties of Somerset, Derby, Devon, York, Northumberland, Cumberland, Montgomery, Caernarvon, Flint, Denbigh, Cardigan, and the Isle of Anglesea.

Lead is often used by unprincipled tradesmen for correcting the rancidity of damaged rape-seed oils, and those of almonds, and olives. A similar pernicious fraud is practised also with acid wines, which by dissolving a sufficient portion of lead, acquire a sweetish taste. In both instances the frauds may be detected by the following experiment:

Let a small quantity of the suspected liquor be mixed with orpiment, or liver of sulphur in lime-water: on shaking together the two fluids, and suffering them to subside, the liquor, if adulterated with lead, will acquire an orange-red colour; but if it be pure, it will assume only a pale yellowish shade.

LEAD, *Red*, or MINIMUM, (GER. *Menige*. DU. *Menie*. DA. *Minie*. SW. *Mönja*. FR. *Minium*, *Plomb rouge mat*. IT. *Minio*. SP. *Minium*, *Azarcon*. PORT. *Minio*, *Azarcas*. RUS. *Surik*. POL. *Minia*. LAT. *Minium*.) is a calx of lead, of a lively red colour, which it acquires by slow calcination. The genuine quality of red lead may be ascertained by the brightness of its colour; and as it is frequently adulterated, the fraud may be easily detected by mixing equal quantities of minimum, and charcoal, in a crucible, and placing the whole over a fire sufficiently intense to melt the lead. When it has continued for some time over the flame, it must be removed; and when cold struck against the ground. Thus the red lead will be reduced to its metallic state; and when freed from the charcoal, its diminished weight will

show the proportion of adulterated matter. See MINIMUM.

LEAD, *White*. See CERUSE.

LEAD, *Black*. The powder of this lead serves to cover razor-strops; and considerable quantities of it are used for imparting a bright gloss to cast-iron grates or stoves. It may also be advantageously employed to smooth the inner surface of wooden screws, packing-presses, and other wood-work, that is subject to frequent friction, for which purpose it is far superior to any greasy, soapy, or oily matter. Black lead is imported from Malaga in Spain, and also found in Cumberland, where it is protected by a particular statute. See title BLACK-LEAD PENCILS, ante. Also ANTI-ATTRITION.

LEAD, *Sugar or Salt of*, (GER. *Bleyzucker*. DU. *Loodsuiker*. DA. *Blyesukker*. SW. *Blysocker*. FR. *Sucre de saturne*. IT. *Zuchero di saturno*. SP. *Azucar de saturno*. PORT. *Assucar de saturno*. LAT. *Saccharum saturni*.) is made from ceruse or white-lead, which, being dissolved without difficulty in the acetic acid, affords a crystallizable salt, called *sugar of lead*, from its sweet taste.

Lead is used in the manufacturing of the finer kinds of glass, to make it bear changes of heat and cold better; also to give it a proper degree of weight, a susceptibility of being cut without breaking, and a capacity to take a higher polish. Its oxides are also used for dyeing and calico-printing; in the manufacturing of earthen-ware and porcelain; and in the preparation of various pigments. A native chromate of lead has been found in a gold-mine in Siberia, in prismatic crystals of a beautiful hyacinth red colour.

LEAGUE, a measure of length, containing more or less geometrical paces, according to the different usages and customs of countries. A league at sea, where it is chiefly used by us, (being a land measure mostly peculiar to the French and Germans,) contains 3000 geometrical paces, or three English miles. The French league sometimes contains the same measure, and in some parts of France it consists of 5500 paces: the mean or common league consists of 2400 paces, and the little league of 2000. The Spanish leagues are larger than the French, seventeen Spanish leagues making a degree, or twenty French leagues, or sixty-nine and a half English statute miles. The Dutch and German leagues contain each four geographical miles. The Persian leagues are pretty nearly of the same extent with the Spanish; that is, they are equal to four Italian miles, which is pretty near to what Herodotus calls the length of the Persian parasang, which contained thirty stadia, eight of which, according to Strabo, make a mile.

LEAK, among seamen, is a hole in the ship through which the water comes in. To spring a leak, is said of a ship that begins to leak; to stop a leak, is to fill it with a

plug wrapt in oakum and well tarred, or putting in a tarpaulin-clout, to keep the water out; or nailing a piece of sheet-lead upon the place.

LEAKAGE, in commerce, is an allowance of 12 per cent. in the customs, granted to importers of wine for the waste and damage the goods are supposed to have received in the passage; an allowance of two barrels in twenty-two is also made to the brewers of ale and beer, by the excise office, as leakage.

LEASE, a conveyance of lands, generally in consideration of rent, or other annual recompence made for life, for years, or at will, but always for a shorter term than the lessor has in the premises, otherwise it partakes more of the nature of an assignment.

By the common law, all persons seised of an estate might grant leases for any period less than their interest lasted; but statutes have been since made, some to enlarge and some to restrict it. They are divided into enabling and restricting statutes; by the enabling stat. 32 Henry VIII. c. 28., a tenant in tail may make leases to insure for twenty-one years, or three lives, to bind his issue in tail, but not those in remainder or reversion. Husbands seised in right of their wives may make leases for the same period, provided the wife join in it. All persons seised of an estate of fee-simple in right of their churches, except parsons or vicars, may bind their successors under certain restrictions. 1. The lease must be by indenture; 2. It must begin from the day of making; 3. All old leases must be surrendered, or be within a year of expiring; 4. It must be for three lives, or twenty-one years, not both; 5. It may be for a shorter term, but must not exceed twenty-one years; 6. It must be of lands and tenements most commonly let for twenty years past; 7. The most usual rent for that time must be reserved; 8. Such leases cannot be made without impeachment of waste. It was also specified that the lease must be of corporeal hereditaments, that the lessor might resort to them to distrain; but by stat. 5 Geo. III. c. 17., a lease of tithes or other incorporeal hereditaments may be granted, and the successor shall have his remedy by an action of debt.

From the disabling statutes, we find that all colleges, cathedrals, and other ecclesiastical or eleemosynary corporations, and all parsons and vicars are restrained from making leases unless under the following regulations: 1. They must not exceed three lives, or twenty-one years; 2. The accustomed rent must at least be reserved thereon; 3. Houses in corporations of market-towns may be let for forty years, provided they are not the mansion-houses of the lessors, or have not more than ten acres of ground belonging to them; and provided the lessee agrees to keep them in repair, and they may be aliened in fee-simple for lands of equal

value in recompence; 4. If there is an old lease which has more than three years to run, no new lease shall be made; 5. No lease shall be made without impeachment of waste; 6. All bonds and covenants tending to frustrate the provisions of the statutes of 15 and 18 Eliz. shall be void.

Two observations seem to present themselves concerning these statutes: 1. That they do not enable any persons to make such leases as they are by common law restrained from making; therefore, a parson or vicar, though he is restrained from making longer leases than for twenty-one years or three lives, even with the consent of the patron or ordinary, yet is not enabled to make any lease at all, to bind his successor without such consent. 2. Though leases contrary to the acts are void, yet they are good against the lessor during his life, if he be a sole corporation: and if it be an aggregate corporation, as long as the head lives; for the act was intended for the benefit of the successor alone, and it is a maxim of law that no man shall take advantage of his own wrong. With regard to college leases, one-third of the old rent must be reserved in wheat or malt, reserving a quarter of wheat for every 6s. 8d. and a quarter of malt for every 5s.; or the lessees must pay for the same, at the price of the market nearest the respective colleges, on the market-day before the rent is due.

There are further restraining statutes which direct, that if any beneficed clergyman is absent from his benefice above eighty days in the year, all leases and agreements made by him of the profits of his cure shall be void, except in the case of licensed pluralists, who are allowed to demise the living to the curate, if he is not absent more than forty days in the year. See 13 Eliz. c. 20. 14 Eliz. c. 11. 18 Eliz. c. 11. and 43 Eliz. c. 9. See also 57 Geo. 3. c. 99. s. 32 & 33. respecting demises of houses wherein ecclesiastical persons are directed by the bishop to reside.

All leases, except such as do not exceed three years from the making, whereupon the reserved rent must be at least two-thirds of the improved value, must be in writing, though no particular form of words is necessary to constitute a good lease.

They must be made to natural-born subjects of this realm, or such as have been naturalized, or to denizens, for all leases made to aliens shall be void: and there is even a statute in force, 32 Henry VIII. c. 16., which imposes a penalty of 5*l.* on the lessor and lessee. It has, however, been held, that an alien merchant may take a house for his own residence, but it shall not go to his executors; the reasons for these laws are evident, to prevent foreigners getting too firmly settled in the kingdom.

LEASE and *Release* is a conveyance which since the stat. 27 Hen. VIII. c. 10

commonly called the statute of uses, has taken place of the deed of feoffment, as it supplies the need of livery and seisin. It is made thus: A lease or bargain and sale for one year, from the tenant to the lessee is first prepared, whereby the lessee becomes actually possessed of the lands, then by the above-mentioned statute the lessee is enabled to take a grant of the lands intended to be conveyed to him and his heirs for ever; accordingly a release is made, reciting the lease, and declaring the uses. In the lease, a pepper-corn is a good consideration to make the lessee capable of receiving a release. This mode of conveyance is now become the usual one. 2 *Black. Com.* 359.

LEASES, value of. The purchaser of a lease may be considered as the purchaser of an annuity equal to the rack-rent of the estate; and the same principles from which are deduced the present value of annuities to continue during any given term, will apply to the value of leases. The sum paid down for the grant of a lease is so much money paid in advance for the annual rents, as they may become due: or, it may be considered as a sum which, put out to interest, will enable the lessor to repay himself the rack-rent of the estate, or the yearly value of his interest therein, during the given term; therefore no more money should be demanded by the lessor, for the grant of the lease, than will enable him to do this at a given rate of interest. In order to find what this sum should be, it would be necessary to ascertain separately the present value of each annual rent, or the sum which, put out to interest at the given rate, will enable the landlord to repay himself the several yearly rents as they become due. Thus, if a person has 100*l.* due to him a twelvemonth hence, and he wishes to have the value of the same advanced immediately, the sum that ought to be given as an equivalent thereto, allowing 5 per cent. interest, is 95*l.* 4*s.* 9 $\frac{3}{4}$ *d.*; for this is the sum which, put out to interest at the rate of 5 per cent. will, at the end of the year, amount to 100*l.* So also, if a person has 100*l.* due to him at the end of two years, and he wishes to have the value advanced immediately, the sum that ought to be given as an equivalent thereto, is 90*l.* 14*s.* 0 $\frac{3}{4}$ *d.* for this is the sum which, put out at the same rate of interest, will, at the end of two years, amount to 100*l.* In the same manner, if a person has 100*l.* due to him at the end of three years, and he wishes to have the value of the same immediately, the sum that ought to be given as an equivalent thereto, is 86*l.* 7*s.* 8*d.* for this is the sum which, put out at the same rate of interest, will, at the end of three years, amount to 100*l.* And if these three values are added together, they amount to 272*l.* 6*s.* 6*d.* which is the sum that ought to be paid down for the lease of an estate for three years, of the annual rent of 100*l.* Had

the rate of interest been 6 per cent. or any higher rate, the answer would have come out less than the value above given; or, had it been 4 per cent. or any lower rate, the answer would have come out more than such value: whence it is obvious, that, in purchases of this kind, we ought previously to determine the rate of interest at which we are disposed to lay out our money. The value of leases at 5 per cent. compound interest may be found from table 2, article ANNUITIES; but as most persons in purchasing leases expect to make somewhat more than 5 per cent. interest of their money, the following table is more applicable to this purpose.

TABLE,
Shewing the Number of Years' Purchase that ought to be given for a Lease, for any Number of Years not exceeding 100, at 6, 7, and 8 per Cent. Interest.

it may be justly estimated to be worth; otherwise it will be impossible to determine, with any degree of accuracy, the real sum which ought to be given for the purchase of the same. On this point difficulties will sometimes arise; for, the value of an estate depending very often on some real or supposed advantages, or on some local or personal recommendations, will, in many instances, occasion a difference of opinion; and in most cases, be a matter of some uncertainty. However, when all these circumstances have been taken into consideration, some annual rent equivalent thereto must be assumed, and when this is settled, the value of the lease will be easily found; thus, if an estate is worth 150*l.* yearly rent, the value of a lease thereof for sixty-nine years, allowing the purchaser 6 per cent. interest for his money, is 16.3676 (the number in the table) multiplied by 150, 2455*l.* 2*s.* 9*d.* In many instances, the rent of the estate intended to be leased is charged with some annual expense, such as a reserved or quit rent, the payment of an annuity, taxes, and the like; in such cases the number of years purchase found in the table ought to be multiplied by the difference only between such annual expense and the whole estimated rent of the estate; thus if a person possesses an unexpired term of sixty years in a lease, for which he pays 100*l.* per annum rent, but which is now worth 150*l.* per annum, the gross sum which he ought to receive for the grant of such lease, will be equal to the present value of 50*l.* per annum, for the given term, or 16.1614 (the number in the table corresponding with 60 years, at 6 per cent.) multiplied by 50, which gives 808*l.* 1*s.* 4*d.*

In order to find the annual rent corresponding to any given sum paid for a lease, divide the sum paid by the number of years purchase that are found against the given term in the table, and the quotient will be the annual rent required. Example: A person has given 1000*l.* for the lease of an estate for sixteen years, what annual rent is equivalent thereto, in order to allow the purchaser 7 per cent. interest for his money? In the table against sixteen years, and under 7 per cent. we shall find the number of years purchase to be 9.4466; therefore 1000 divided by 9.4466 gives 105*l.* 17*s.* for the annual rent required.

The values in the table are calculated on the supposition, that the payments of the several rents of the estate are made yearly; if, however, the payments are made half-yearly or quarterly, and the purchaser can put out his money at the same rate, so as to receive his interest half-yearly or quarterly, which may commonly be done; the values will, in such cases, be somewhat more than those given in the table. The difference, however, is not very great, but if the exact value is required, it may in many cases be obtained by attending to the following remarks, viz.

In order to find the value of a lease, it is first necessary to ascertain the true rack-rent of the estate, or the annual value that

that "the value of a lease the rent of which is payable half-yearly, is equal to half the value of the same lease payable yearly, calculated at half the given rate of interest, and to continue double the number of years; and that the value of a lease the rent of which is payable quarterly, is equal to one quarter the value of the same lease payable yearly, calculated at a quarter of the given rate of interest, and to continue four times the number of years."

It frequently happens, that a long lease is not to be entered on or enjoyed till after the expiration of a short lease, or till the end of a given number of years; in such cases, deduct the value of the short lease, or the value set against the given number of years in the table, from the value of the longer lease, and the difference will give the true present value of the longer lease. Example: What sum ought to be given for the remainder of the lease of an estate for 56 years, after the next seven years, allowing the purchaser 6 per cent. interest for his money, the clear rent being reckoned at 70*l.* per annum? In the table against 56 years, and under 6 per cent. we find 16.0288, and in the same column, against seven years we find 5.5823; the latter value subtracted from the former, leaves 10.4465, which multiplied by 70, gives 731.255 or 731*l.* 5*s.* 1*d.* for the sum required.

Leases are frequently granted during a life, or for a specified term of years subject to termination, if a given life or lives should fail or become extinct within such term; sometimes they depend on the longest of two or three lives, with liberty on the failure of one or more of the lives to nominate others on payment of a fine.

The following ordinary form of a lease of a house in London, may be sufficient to convey a general understanding of the subject, and any attempt to do more in a work of this kind *must* be superfluous, and *might* be mischievous, for reasons repeatedly assigned in the course of the volume.

This indenture, made, &c. between A. B. of, &c. of the one part, and C. D. of, &c. of the other part, witnesseth, that for and in consideration of the yearly rent, and of the covenants, provisoes, and agreements hereinafter reserved, and contained, by and on the part and behalf of the said C. D., his executors, administrators, and assigns, to be paid, kept, observed, and performed, he the said A. B. hath demised and leased, and by these presents doth demise and lease, unto the said C. D., his executors, administrators, and assigns, all that messuage or tenement, and dwelling-house, situate and being — street, in the parish of —, in the city of London, together with — (here describe the particulars of the premises); and also all ways, paths, passages, lights, casements, rooms, vaults, cellars, yards, water-courses, profits, conveniences,

hereditaments, and appurtenances whatsoever, to the said messuage or premises hereby demised belonging, or in anywise appertaining, or reputed or known to be part, parcel, or member thereof, all and singular; which said messuage and premises are now, or lately were, in the occupation of E. F., his assignee or assigns, to have and to hold the said messuage or tenement, and premises, with the appurtenances hereby demised, or so mentioned, to be unto the said C. D., his executors, administrators, and assigns, from the — day of — now last past, for and during the term of — years thence next ensuing, and fully to be completed and ended; determinable nevertheless at the expiration of the first seven or fourteen years thereof, upon such conditions as are hereinafter mentioned; he the said C. D., his executors, administrators, and assigns, yielding and paying yearly, and every year, during the said term, unto the said A. B., his executors, administrators, and assigns, the yearly rent or sum of — *l.* of lawful money of the United Kingdom of Great Britain and Ireland, the same to be paid by equal quarterly payments, on the respective days following: on the 25th day of March, the 24th day of June, the 29th day of September, and the 25th day of December, in every year, (save and except at all times during the said term, such proportionable part of the said yearly rent of — *l.* as shall or may grow due during such time; or the messuage or tenement hereby demised shall, without the hindrance of the said C. D., his executors, &c. be and remain uninhabitable, by reason of accidental fire,) and to be clear of all and all manner of parliamentary, parochial, and other taxes, assessments, rates, and deductions whatsoever; the first quarterly payment thereof to commence and be made on the — day of — next ensuing the date of these presents: and the said C. D. doth hereby for himself and his executors, covenant, promise, and agree to, and with the said A. B., his executors, &c. that he the said C. D., his executors, &c. shall and will yearly, and every year, during the continuance of the said term hereby demised, (save and except as aforesaid,) well and truly pay, or cause to be paid, unto the said A. B., his executors, &c. the said yearly sum or rent of — *l.* of lawful money of the United Kingdom of Great Britain and Ireland, on the respective days, and in the manner the same is hereinbefore made payable; and also shall and will well and truly pay, or cause to be paid, all and all manner of taxes, assessments, rates, and impositions, whatsoever, parliamentary, parochial, or otherwise, (the land-tax only excepted,) which now are, or shall at any time during the continuance of the said term hereby demised, be assessed, rated, or imposed, on the said demised messuage or tenement, and premises, or any part thereof, or on the said yearly

rent hereby reserved, or any part thereof, or on the said C. D., his executors, &c. on account thereof; and also that he the said C. D., his executors, &c. shall and will, at his and their own proper costs and charges, cause to be well and sufficiently painted, all the outside wood and iron-work belonging to the said message or tenement, and premises hereby demised, every third year, during the continuance of the said term; and at his and their like proper costs and charges, shall and will, at all times during the continuance of the said term, keep in a good, sufficient, and tenantable state of repair, as well all and singular, the glass and other windows, wainscots, rooms, floors, partitions, ceilings, tilings, walls, rails, fences, pavements, grates, sinks, privies, drains, wells, and water-courses: as also all and every other the parts and appurtenances of the said message or tenement, and premises hereby demised (damage happening by casual fire only excepted): and further, that it shall be lawful for the said A. B., his executors, &c. either alone or with others, twice in every year, during the said term hereby granted, at such times of the year as to him or them shall seem meet, to enter, at seasonable times of the day, into and upon the said message or tenement, and premises hereby demised, and every part thereof, and there to view and examine the state and condition thereof; notice of such intention to view being at all times previously given unto the said C. D., his executors, &c. three days at least before the same shall take place; and in case any decay or want of reparation be found on such view, the said C. D., for himself, his executors, &c. doth hereby covenant, promise, and agree to, and with the said A. B. his executors, &c. to cause the same to be well and sufficiently repaired and amended within the space of six months, after notice thereof in writing shall have been given to him or them for that purpose; and the said C. D. doth hereby for himself, his executors, &c. promise, covenant, and agree to, and with the said A. B., his executors, &c. that he the said C. D., his executors, &c. at the end or earlier determination of the said term hereby granted, shall and will have, and yield up unto the said A. B., his executors, &c. all and singular, the said message or tenement, and premises, with their appurtenances, in such good, sufficient, and tenantable state of repair as aforesaid; together with all and every the doors, locks, keys, bolts, bars, chimney-pieces, dressers, shelves, water-pipes, and other things mentioned in an inventory or schedule (which schedule or inventory must be stamped) hereunder written or hereunto annexed, in as good plight and condition as the same now are (reasonable use and wear thereof, and casualties happening by fire, only excepted). Provided always, and these presents are

upon this express condition, that if the said yearly rent hereby reserved, or any part thereof, shall be in arrear and unpaid for the space of — days next after any of the days whereon the same is hereinbefore covenanted to be paid as aforesaid (it being first lawfully demanded); or if the said C. D., his executors, &c. shall not well and truly observe and keep, according to their true intent and meaning, all and every the covenants, clauses, provisoes, and agreements, by him and them to be observed and kept; then and from thenceforth, in either of the said cases, it shall be lawful for the said A. B., his executors, &c. to re-enter into and upon the said hereby demised message or tenement, and premises, or any part thereof, in the name of the whole, wholly: and the same to have again, retain, re-possess, and enjoy, as his and theirs, and first and former estate; and the said C. D., his executors, &c. and all other tenant and occupiers of the said premises, thereout utterly to eject and remove; and that from and after such re-entry made, this lease, and every clause and thing herein contained, shall determine, cease, and be utterly void, to all intents and purposes, any thing herein contained to the contrary thereof notwithstanding; and the said A. B., for himself, his executors, &c. doth covenant, promise, and agree to, and with the said C. D., his executors, &c. by these presents, in manner following, that is to say, that he the said C. D., his executors, &c. paying the rent hereby reserved, in manner aforesaid, and performing the covenants and agreements herein contained, and by him and them to be kept, done, and performed, shall, and lawfully may, peaceably and quietly, have, hold, use, occupy, possess, and enjoy, the message or tenement, and all other the premises hereby demised, for and during the said term of — years, hereby granted, without any lawful action, let, suit, or interruption whatsoever, of the said A. B., his executors, &c. or any other person or persons lawfully claiming, or to claim, by, from, or under him, them, or any of them (if under an original lease add), and that freed and discharged, or otherwise, by the said A. B., his executors, &c. saved harmless and indemnified from the rents and covenants reserved and contained in a certain indenture of lease, bearing date the — day of —, in the year of our Lord —; whereby the said A. B. holdeth the said message or tenement, and premises hereby demised, from the date thereof, for the term of — years, and from all claims and demands whatsoever, in respect thereof); and the said A. B. doth hereby further covenant, promise, and agree to, and with the said C. D., his executors, &c. that the said A. B. his executors, &c. shall and will, before the expiration of this present lease, on the request, and at the costs and charges of the said C. D., his ex-

cutors, &c. grant and execute unto him and them a new and fresh lease of the messuage or tenement, and all other the premises hereby demised, with their appurtenances, for the further term of — years, to commence from the expiration of the term hereby granted; the same to be at the same yearly rent, payable in like manner, and under and subject to the like covenants, provisoes, and agreements (except a covenant for the renewal thereof, at the end of such further term), as are contained in these presents; such new lease, however, to be granted, and to be valid only on condition that the said C. D., his executors, &c. do execute a counterpart thereof, and also pay unto the said A. B., his executors, &c. the sum of —*l.* of lawful money, &c. at the time of executing the said lease, as and by way of premium for the renewal thereof; and also, that if the said C. D., his executors, &c. shall be desirous to quit the said messuage or tenement and premises hereby demised, at the expiration of the first seven, or the first fourteen years of the term of — years hereby granted, and of such his or their desire, shall give notice in writing to the said A. B., his executors, &c. six calendar months before the expiration of the said first seven or fourteen years (as the case may be); then and in such case (all arrears of rent being duly paid, and the said messuage or tenement, and all other the premises hereby demised, being in such repair as they are hereinbefore covenanted to be maintained and left in) this lease, and every clause and thing herein contained, shall, at the expiration of such first seven or fourteen years of the said term of — years, hereby granted (which-ever be in the said notice expressed) determine, and be utterly void, to all intents and purposes, in like manner as if the whole term of — years had been run out and expired; any thing in these presents contained to the contrary thereof notwithstanding. In witness whereof, the said parties have hereunto set their hands and seals, the day and year first above written.

Sealed and delivered, being }
first duly stamped, in the }
presence of — }

Covenant by the lessee not to use and assign the premises for any offensive trade.

And also that the said C. D., his executors, &c. shall not, nor will, at any time during the continuance of the said term hereby granted, use, or carry on, or suffer, or permit to be used or carried on in the said demised messuage or tenement, and premises, or assign over the present indenture of lease, or set over, let, or assign any part of the said messuage or tenement, and premises, to any person or persons using or carrying on the trade, business, or calling of a maker of — or other chairs, baker, brewer, butcher, currier, distiller, dyer, founder, smith,

soap-boiler, school-master, or school-mistress, sugar-baker, auctioneer, pewterer, tallow-chandler, or tallow-melter, working-brazier, tinman, tripe-boiler, pipe-maker, pipe-borer, plumber, or any other noxious or offensive trade, business, or calling whatsoever, without the consent in writing of the said A. B. his executors, &c. first had and obtained for that purpose; nor shall, nor will, without such consent as aforesaid, make, or cause to be made, any addition or alteration whatever, in, upon, or about the said messuage or tenement, and premises, or any part thereof.

LEATHER. (GER. *Leder*. DU. *Leder*, *Leër*. DA. *Læder*. SW. *Läder*. FR. *Cuir*. IT. *Cuojo*. SP. *Cuero*. PORT. *Couro*, *Coiro*. RUS. *Kosha*. POL. *Rzemien*. LAT. *Corium*.) the skins of various quadrupeds dressed in a particular manner for the use of manufacturers, whose business it is to make them up, according to their different employments. The butcher and others who flay them off the carcasses, dispose of them raw or salted to the tanner and tawyer; they to the chamois, morocco, and other kinds of leather-dressers, who prepare them according to their respective arts, in order to vend them amongst the curriers, glovers, harness-makers, shoe-makers, book-binders, and all in any way concerned in this article. Leather has divers names according to the state in which it is, and according to the different sorts of skins whereof it is prepared, and its peculiar qualities, when so prepared. The three principal assortments of leather are tanned or tawed, oil, and alum leather; thus denominated from the different processes pursued in the preparation of the article. If we reflect on the number of skins of all sorts that this kingdom produces, the prodigious quantity of many kinds which are imported from Ireland, Spain, Portugal, South America, and from our own colonies in America and the West Indies, under the various denominations of hides, deer-skins, deer-pelts, &c. it will appear evident to us that leather is a staple commodity, and may very justly be ranked in the first class of our articles of trade. For the duties and drawbacks upon leather of every description, *see* DUTY. For account of the modes employed in preparing hides and skins, and producing leather, *see* CURRYING, TANNING, and TAWING.

LEATHER, Water-proof.—To effect this purpose with leather, the following are the ingredients.

Boiled linseed oil	-	-	1 lb.
Yellow wax	-	-	2 oz.
Spirit of turpentine	-	-	2 oz.
Burgundy pitch	-	-	1 oz.

Melt them over a slow fire; rub the leather with the mixture, as often as it becomes dry, till thoroughly saturated.

LEATHER, Colouring of. The follow-

ing colours may be imparted to leather, according to the various uses for which it is intended.

Blue.—This colour is given by immersing the piece of leather for twenty-four hours in urine and indigo, after which it is boiled in alum : or the same colour may be communicated by tempering the indigo with red wine, and steeping the skins in the mixture.

Red.—First wash the skins, and afterwards soak them for two hours in galls wrung out, and immersed in a liquor prepared by a solution of privet, alum, and verdigris in water ; when they are steeped in a dye made of Brazil wood boiled with ley.

Purple.—Wet the skins with a solution of Roman alum in warm water, and when dry rub them by the hand with a decoction of logwood in cold water.

Light green.—Dip the leather in sap-green, diluted with boiled alum-water.

Dark green.—This cast is communicated to leather by means of steel-filings and sal ammoniac steeped in urine for a considerable time, and well rubbed into the skin, which must afterwards be dried in the shade.

Yellow.—Anoint the skin with a decoction of aloes and linseed-oil previously strained, or immerse it in a solution of dyers' green weed.

Light orange.—Dip the skins in fustic berries boiled in alum water ; but if a deeper hue be required, turmeric should be substituted for the fustic berries.

LEATHER-CUTTERS. These tradesmen keep large shops, and deal in all kinds of leather for the use of persons in different branches, and purchase hides and skins, which they cut out into pieces of proper sizes for the use of shoemakers, saddlers, &c.

LEATHER-DRESSER. The business of this mechanic is the same with that of the currier, and consists entirely in preparing hides and skins, as they come from the tanners. See **CURRIERS** and **CURRYING**.

LEATHER, Morocco. See **MOROCCO**.

LEDGER, is the principal book of accounts kept by merchants and tradesmen, wherein every person's account is placed by itself, after being extracted from the journal. See **BOOK-KEEPING**.

LEDGES, in a ship, are small pieces of timber lying athwart from the waste-trees to the roof-trees ; they serve to bear up the gratings or nettings over the half-deck.

LEE, in the sea language, a word of various significations, though it is generally understood to mean the part opposite to the wind. Thus lee-shore, is that shore against which the wind blows. "Lee-latch," or "have a care of the lee-latch," is, take care that the ship do not go to the leeward, or too near the shore ; "a-lee the helm," put it to the leeward side of the ship ; "to lie by the lee," or, "to come up to the lee," is to

bring the ship so, that all her sails may lie flat against her masts and shrouds, and that the wind may come right upon her broadside.

LEE-FANG, is a rope reeved into the cringles of the courses, to hale in the bottom of the sail, that the bonnets may be laced on, or the sail taken in.

LEE-WAY, is the angle that the rhumb line upon which the ship endeavours to sail makes upon the rhumb upon which she really sails.

LEES, the grossest part of wine, oil, &c. being the sediment found at the bottom of the vessel. An article for the dyers' use, and those who whiten pins, clock-faces, &c. is made of the lees of wine. See **ARGOL**.

LEETCH-LINES, small ropes made fast to the leech of the topsails, to which they belong, and reeved into a block at the yard close by the topsail ties. They serve to hale in the leech of the sail when the topsails are to be taken in.

LEGACY. A legacy is a bequest, or gift, of goods and chattels by testament ; and the person to whom it was given, is stiled the legatee ; which every person is capable of being, unless particularly disabled by the common law or statutes, as traitors, papists, and some others. This bequest transfers an inchoate property to the legatee ; but the legacy is not perfect without the assent of the executor : for if I have a general or pecuniary legacy of 100*l.* or a specific one of a piece of plate, I cannot in either case take it without the consent of the executor (*Co. Litt.* 111. *Aleyn*. 59.) For in him all the chattels are vested ; and it is his business first of all to see whether there is a sufficient fund left to pay the debts of the testator : the rule of equity being, that a man must be just, before he is permitted to be generous. (*Bract.* l. 2. c. 26.) And in case of a deficiency of assets, all the general legacies must abate proportionably, in order to pay the debts ; but a specific legacy (of a piece of plate, a horse, or the like) is not to abate at all, or allow any thing by way of abatement, unless there be not sufficient without it. (2 *Vern.* 111.) Upon the same principle, if the legatees have been paid their legacies, they are afterwards bound to refund a rateable part, in case debts come in, more than sufficient to exhaust the *residuum* after the legacies paid. *Ibid.* 205.

If the legatee die before the testator, the legacy is a lost or lapsed legacy, and shall sink into the *residuum*. And if a contingent legacy be left to any one ; as when he shall attain, or if he attain the age of twenty-one, and he die before that time, it is a lapsed legacy. (*Dyer* 59. 1 *Eq. Cas. Abr.* 295.) But a legacy to one, to be paid when he attains, or at the age of twenty-one years, is a vested legacy ; an interest which commences *in presenti*, although it be *solvendum in futuro*. And, if the legatee dies before that

age, his representatives shall receive it out of the testator's personal estate, at the same time that it would have become payable in case the legatee had lived. But if such legacies be charged upon a real estate, in both cases they shall lapse for the benefit of the heir (2 P. Wms. 601.); for, with regard to devises affecting lands, the ecclesiastical court hath no concurrent jurisdiction.

But where a legacy is given to another, in case the first legatee dies under twenty-one or a certain age, the legacy must be paid upon the death of the infant. And where it is not given over to another, if it bears interest, his representative shall be entitled to it immediately; but if the interest allowed by the testator is less than the interest allowed by a court of equity, the executor of the testator shall be entitled to the difference until the first legatee would have arrived at the age prescribed by the testator. 2 P. Wms. 478. 1 Bro. 105.

A bequest of a residue or fund to all the children of A., to be paid when they shall attain the age of twenty-one, must be divided among those only who are in existence, when the eldest attains that age. 3 Bro. 404.

Where a legacy was given to the eldest child of A. upon the death of B., A. had at the death of B. only illegitimate children, but had afterwards a legitimate child, it was held that neither could take, the first not legally answering the description, and the second not existing when the legacy was to vest. 6 Ves. Jun. 43.

It is generally true, that both portions created by deed or will, and legacies which are to be raised out of real property, and to be paid upon a future day, shall never be raised if the person to whom they are given dies before the day of payment. But legacies and portions in a will shall be raised, if the time of payment is postponed on account of the circumstances of the testator's estate, and not on account of the circumstances of the legatee; or where it is the apparent intention of the testator, notwithstanding the death of the legatee prior to the time specified.

In *Decks v. Strutt*, 5 T. R. 690, it was determined, that no action can be maintained in a court of law to recover a legacy, though it had before been decided, that an action of assumpsit might have been brought against an executor in his own right, if in consideration of assets in his possession he had promised to pay the legatee the legacy. Cowp. 284. 289.

But if the executor assents, an action at law may be maintained for a specific legacy, as for a lease or any other chattel. 3 East, 120.

All legacies are subjected to very heavy duties, by 55 Geo. 3. c. 184.; but the amounts are regulated by the relations which the legatees bear to the testators respectively, and are too numerous and intricate to claim insertion here. It is necessary, however, to observe, that independent of what is called

"the legacy duty" itself, paying, administering, or in any manner satisfying any legacy, or personal estate, or receiving the same without taking and giving a legal receipt, and causing the same to be stamped, is a penalty of 10l. per cent. on the sum; but receipts may be stamped within 21 days after date, at the head or any other office, on payment of the duty only, or within 5 months, on payment of the duty, and 10l. per cent. penalty; but not afterwards, on any pretence whatever. 36 Geo. 3. c. 52. sec. 28, 29.

LEMNIAN EARTH, *terra Lemnia*, is a fat, viscid, slippery clay, of a pale red colour. It is brought to us in little cakes or troches, marked with different characters. It has its name from the island of Lemnos, where it is dug. This earth, when genuine, is a good medicine in various diseases.

LEMONS, (GER. *Limonen*. DU. *Limonen*. - DA. *Limoner*. - SW. *Lemoner*. FR. *Lemons*, *Citrons*. IT. *Limoni*. SP. *Limonas*. PORT. *Limões*. RUS. *Limonii*. POL. *Limonii*. LAT. *Citrea mala*;) the fruit of the lemon-tree, growing in great abundance in Spain and Portugal, whence we import them, packed in chests and boxes. The ports of Lisbon and Malaga are the principal shipping places of lemons; the shipping of fruit from these places commences about the middle of September, and continues until the February following, after which time the article becomes scarce and dear.

The lemon-tree is a native of Media and Assyria, and thrives extremely well in warm climates. Besides the two countries already mentioned, this tree is cultivated in Italy, Provence, Languedoc, and other parts of the south of France. The varieties of the lemon are numerous.

The lemons of the Bermuda islands are remarkably large, and their flavour is delicious. Formerly the English consumed great quantities, but for some years past they have rarely been met with in our markets. Sicily produces abundance which are exported to London, Hamburgh, Russia, Germany, and France. The island of Zante abounds in lemons of a very large size; the rind of this fruit is uncommonly smooth, and it contains excellent acid juice.—Lemons are invariably shipped whilst their colour is green, and they generally become quite yellow before they reach this country. If they were to be exported after arriving at a perfect state of maturity, they would rot, and be good for nothing before they could reach the place of their destination. It is usual with some lemon-merchants to take the fruit out of the papers in which it is packed for exportation, and to paper it afresh. This is, however, highly improper, as it has frequently caused every lemon, so treated, to be pinked, and has even been known to destroy whole boxes of fruit within a very short period.

LEMONS, *Pickled*, (GER. *Pokellimonen*.)

Du. Pekellimoenen. Da. Saltear limonen. Sw. Insaltade lemoner. Fr. Citrons salés. It. Limoni insalati. Sp. Limones salados. Port. Limões salgados. Rus. Limonii solemniye, are prepared with a sort of brine, in the same manner as our housewives pickle cabbages, cucumbers, and other vegetables. Pickled lemons are exported in abundance from several parts of Italy, Sicily, &c. principally to France, where they are esteemed a luxury.

LEMON-JUICE, (*GER. Zitronensaft. Du. Limoensap. Da. Lemonsoft. Sw. Citronsaft. Fr. Jus de limon. It. Agro o Sugo di limone. Sp. Jugo de limon. Port. Sumo de limao. Rus. Limonnoi sok. Pol. Sok citrynowy,*) likewise denominated citric acid, is the liquor contained in the lemon. It is useful for many domestic purposes, especially as an ingredient in punch, and is of essential service in pharmacy, though not of great utility in any particular branch of manufacture. It may be preserved in bottles for a considerable time by covering it with a thin stratum of oil; thus secured, great quantities of the juice are exported from Italy to different parts of the world; from Turkey, likewise, where abundance of lemons are grown, several thousand barrels of juice are annually sent to Crimea, &c.

LEMON-PEEL, (*GER. Zitronenshalen, Limonschellen. Du. Limoenschillen. Da. Citronskaller. Sw. Citronskal. Fr. Lames d'écorce de citron. It. Scorze di limone. Sp. Cortexas de cidra. Port. Corticas de cidrao. Rus. Citroniija korki. LAT. Cortex citri,*) the outward rind of lemons, is turned to many uses, and when well candied, constitutes a very good preserve.

In the island of Barbadoes, a most delicious *liqueur*, known under the name of *Eau de Barbade*, is extracted from the lemon-peel, which the inhabitants also have the art of preserving in a manner peculiar to themselves. Both the *liqueur* and the conserve are in high repute, especially in France.

LEMON, essential salt of, super-oxalat of potash. It is principally employed in extracting stains from linen, muslin, &c.

LENTISK, the tree which produces the resin called mastich. This tree flowers about the month of May, and its fruit arrives at maturity towards the middle of August. Every part of it is highly resinous. It grows in the south of France, in Italy, the islands of the Archipelago, especially in Chio, and in Turkey. In the isle of Chio the inhabitants, about the month of July, make incisions in the trunk and in the larger branches of the tree, whence a resinous gum, which they call mastich, flows in tolerably big tears. The best sort of the mastich, or, in other words, the purest kind, is paid by the islanders as a tribute to the Turkish emperor. The Turkish women chew mastich habitually, pretending that it improves their breath.

In the East, we know, it is customary to use aromatic substances for the purpose of lessening any difficulty of breathing. This custom is in some sort necessary by reason of the heat of oriental climates, which perturbs the passions and inflames the organs of speech and respiration.

LEOPARD-SKINS. (*GER. Leopardenfelle. Du. Luipaardvellen. Da. Leopardskind. Sw. Leopardskinn. Fr. Peaux de Leopard. It. Pelli di Leopardo. Sp. Pielas de Leopardo. Port. Pelle de Leopardo.*) The leopard is distinguished from the panther by its paler yellow colour, its smaller size, and the somewhat closer disposition of its spots. The leopard is a native of Senegal and Guinea, as well as of many other parts of Africa: it also occurs in Persia, India, China, and several other parts of Asia. A variety of this species, of a dusky black, marked with spots of a deeper or more glossy black, is found in Bengal. The black skins are the most esteemed. Leopard-skins are principally employed as furniture for war-horses, &c.

LEPIDOLITE, a stone first brought into notice by the name of lilalite, and considered as a species of gypsum, and afterwards classed as a zeolite by Born. It is of a violet colour, or purple, in the mass, separable into laminae, which have the lustre of mother-of-pearl. Though soft enough to be scratched with the nail, it is susceptible of some polish.

LESSOR and LESSEE. See LEASE.

LETTER, in its primary sense, is a character either in print or writing, by which a sound is conveyed to express thoughts. But the sense in which we are concerned to consider it here, is that of a communication sent by one person to another, and more correctly denominated "*Epistle*." Of these there are a great variety recognized by law or custom, and partaking in some degree of public instruments; such as letters of attorney; letters of credit among merchants; letters of licence to bankrupts; letters of marque to cruise against an enemy in time of war; letters missive in the court of chancery; letters patent from the crown, conferring some exclusive right to a subject; letters circular, &c. &c. Letters of an entirely private nature, are, in different views of them, especially under the cognizance of the law by divers statutes.

By the act of 9 Anne, c. 10. no persons whatsoever shall receive, take up, order, dispatch, convey, carry, re-carry, or deliver any letters, or packets of letters, or make any collection of letters, or employ any vessel or boat, or other conveyance by sea or land, either coastways within Great Britain, or to or from Ireland, or beyond the seas, on pain of forfeiting 5*l.* for every offence, and also 100*l.* for every week that the practice is continued.

This act renders carriers, masters of coaches, coachmen, watermen, bargemen, and masters of vessels, liable to the penalties, even if they carry letters without hire or reward.

By act of 42 Geo. 3. c. 81. no person whatsoever shall send, or cause to be sent, or tender or deliver in order to be sent, otherwise than by the post, or to the nearest post-town, to be forwarded by post, any letters or packets, on pain of forfeiting 5*l.* for every offence.

These penalties may be recovered with costs by any person who will inform and sue for the same; one moiety to the king, and the other to the informer.

There is an exception as to letters which concern goods sent by common carriers, so as they are sent with and for the purpose of being delivered with the goods, without hire, reward, or advantage. Also as to letters sent by any private friend on his journey, or by any messenger on purpose.

Under this law, a person carrying a letter may inform against a person sending one.

By act of 55 Geo. 3. c. 33. owners, charterers, and consignees of vessels, may, under certain restrictions, send their letters on board their own ships from Great Britain to the Cape, the Mauritius, and the East Indies, free from sea postage, and may receive their letters by their own vessels from all places beyond the seas, free from sea postage. — Owners and shippers of goods may send letters, under certain restrictions, with their goods, on board any vessel, to the Cape, the Mauritius, and the East Indies, free from ship-letter postage; and owners and consignees of goods on board ships arriving from abroad, may receive letters free from sea postage by such ships.

Members of parliament, and certain public officers, are privileged to send and receive letters to a certain extent free of postage; but by 42 Geo. 3. c. 63. and several previous statutes, it is declared to be felony to counterfeit the hand-writing of any such member of parliament in the superscription of such letter to avoid payment of postage.

By 24 Geo. 3. c. 37. foreign prohibited goods sent in any letter to any person in this country, are to be taken out in presence of a justice and destroyed. *See further title POST-OFFICE.*

LETTER or POWER of ATTORNEY, is an instrument giving to a second person the authority to do any lawful act in the stead of the maker. Letters of attorney are sometimes revocable, and sometimes not; in the latter case the word irrevocable is inserted. The authority must be strictly pursued: and if the attorney does less than the power it shall be void; if more, it shall be good as far as the power goes, and void as to the rest; but these rules have many exceptions. *See 1 Inst. 258.*

General Power of Attorney to act in the Management of all his Estates, Property, and Effects, during the Residence of a Merchant abroad.

To all to whom these presents shall come, A. B. of, &c. sendeth greeting. Whereas the said A. B. is shortly going to the East Indies, and is therefore desirous of appointing a person, and of giving him sufficient powers and authorities to do and execute every act, deed, matter, and thing whatsoever, which shall be requisite and necessary to be done and executed with respect to the entire management of all the estates, monies, property, and effects of the said A. B. during his residence beyond the seas. Now therefore these presents witness, that the said A. B. hath made, constituted, and appointed, and in his place and stead put, and by these presents doth, &c. his brother, C. D. his true and lawful attorney, for him, and in his name, to enter into and upon, and to take possession of all and singular the honors, manors, messuages, farms, lands, tithes, and hereditaments, freehold, copyhold, and leasehold, whatsoever and wheresoever, to the said A. B. belonging, or in any wise appertaining, or wherein, or whereof the said A. B. hath any estate, or inheritance, and to make sale of, or convey in exchange for other freehold, copyhold, or leasehold estates any of the said freehold, copyhold, or leasehold estates of him the said A. B. and the money arising from such sales, or on account of any exchange to lay out and invest in other lands and hereditaments, or on government or real securities, or otherwise, as he shall think fit, and to sign, seal, and execute, and as the act and deed, and acts and deeds of the said A. B. to deliver any deed or deeds, conveyances, and assurances for conveying, either by way of absolute sale, or in exchange for other freehold, copyhold, or leasehold estates, such freehold, copyhold, or leasehold estates of the said A. B. which may be sold or exchanged, and to sign receipts for the consideration money on such sales or exchanges; and also to transpose or transfer any mortgages or other securities which he the said C. D. may take for any monies which from time to time may have arisen from such sale or sales, exchange or exchanges, and may have been placed out on such securities; and also to view, search, and see the state, condition, and defects of the reparation of all the said estates of the said A. B. and forthwith to give proper notices and directions for repairing the same, and generally to oversee, set, let, manage, and improve the said estates of the said A. B. to the best advantage; and also from time to time to fell or cut down any wood or underwoods, timber, or other trees standing or being on any of the said lands and hereditaments of the said A. B. which he hath power to cut down, as his said attorney

shall see fit, and the same to sell and dispose of, or allow for repairs, or otherwise, in or about the said premises, and generally to repair and uphold, or take down and new-build all or any houses, edifices, or buildings in and upon the said lands and hereditaments, as occasion shall require, or do any other act or thing for the improvement of the same. And also to pay all taxes, rates, charges, deductions, expenses, and all other payments whatsoever, due and payable, or to grow due and payable, for or on account of the honors, manors, messuages, lands, hereditaments, and other the premises the estate of the said A. B. And also to contract with any person or persons for leasing any of the said premises, and to set fines for new leases, and to accept surrenders of leases, and for that purpose, for the said A. B. and in his name, and as his act and deed, to make, seal, deliver, and execute any lease or leases, demises, or grants, or other lawful deeds or instruments whatsoever which shall be necessary and proper in that behalf, and also for, and in the name of, the said A. B. to ask, receive, and recover of all the stewards, bailiffs, receivers, farmers, tenants, and all other occupiers whatsoever, of all and every the said lands and hereditaments of the said A. B. all rents, arrears of rent, services, issues, profits, emoluments, sum and sums of money due, owing, and payable, or at any time hereafter to grow and become due, owing, and payable for, or in respect, or on account of, the same premises, in any manner whatsoever; and an account and accounts of them and all other the stewards, bailiffs, and accountants whatsoever of the said A. B. or any of them, to require and take; and the said stewards, bailiffs, receivers, and servants, to displace and remove, as his said attorney shall think fit, and on the displacing or death of any of them, new stewards, bailiffs, receivers, servants, or other agents, to put and appoint in the place of those so displaced or dying; and also to sue for, receive, and recover all manner of debts, dues, duties, rents, services, amerciements, sum and sums of money whatsoever due, or to grow due, to the said A. B. in respect of the premises aforesaid, and on non-payment thereof, or of any part thereof, to enter and distrain, and the distress and distresses then and there found, to detain and keep, or otherwise to sell and dispose of the same according to law; and also for, and in the name of, the said A. B. to commence and prosecute any action or actions, suit or suits, as well real as personal and mixed, in any court of law or equity, for the recovery of any debt, matter or thing whatsoever, due or payable, or to become due or payable, or coming unto, or any wise appertaining or belonging to the said A. B. by any means, or on any account whatsoever, and the same action or actions, suit or suits, to prosecute and fol-

low, or to discontinue or become nonsuit therein, if my said attorney shall see cause; and also for him the said A. B., and in his name generally to use and take such lawful ways and means for the recovering, receiving, obtaining, or getting in any rent, sum and sums of money, or other things whatsoever, which is, are, shall, or may be, or by his said attorney shall be conceived or thought to be due, owing, belonging, or payable unto the said A. B. unto any person or persons whomsoever, as fully and effectually to all intents and purposes as the said A. B. might or could do, use, or take, if he was present in person; and also upon payment, receipt, or recovery of all and every the aforesaid rents, arrears of rent, profit, produce, debts, dues, sum and sums of money for him the said A. B., and in his name to give proper acquittances and discharges for the same respectively; and also for, and in the name of the said A. B., to present a fit person or persons to any church or churches, or ecclesiastical benefice or benefices, to the advowson or right of presentation whereof the said A. B. is, or shall, or may be entitled; and generally for him the said A. B., and in his name, to do, execute, and perform all and every other act and acts, thing and things, needful and expedient in and about the premises, as fully and effectually to all intents and purposes as he the said A. B. could do if he were personally present, he the said A. B. hereby ratifying and confirming, and agreeing to ratify and confirm, all and whatever his said attorney C. D. shall lawfully do, or cause to be done, in and about the premises aforesaid; and for the better doing, performing, and executing of all or any the matters and things aforesaid, he the said A. B. doth hereby further give and grant unto the said C. D., his attorney, full power and authority to constitute and appoint, and in his place and stead put one or more attorney or attorneys for him the said A. B., and as his attorney or attorneys, and the same again at his pleasure to revoke, and other or others in his or their place or places to substitute. And whereas it is the intention of the said A. B. in case the said C. D. should happen to depart this life during the absence of him the said A. B., that immediately after the decease of him the said C. D., E. F., the brother of the said A. B. and C. D. should act as attorney for the said A. B. in the room or stead of the said C. D., and the said A. B. is therefore desirous of sufficiently authorising and empowering him the said E. F. so to do. Now therefore these presents further witness, that the said A. B. hath made, constituted, and appointed, and in his place and stead put, and by these presents doth, &c. the said E. F. his true and lawful attorney for him the said A. B. and in his name, from and after the decease of the said C. D. (in case he shall happen to depart this life during the absence of the said

A. B., to do, make, sign, seal, and execute all such act and acts, deed and deeds, matters and things whatsoever, as the said C. D. hereinbefore by these presents is authorised and empowered to do, make, and execute; the said A. B., to that intent, hereby giving and granting to, and vesting in the said E. F. all and every such and the same powers and authorities so to do, in as full, ample, and extensive a manner, to all intents and purposes whatsoever, as are hereinbefore by these presents given and granted to and vested in the said C. D.; and the said A. B. doth hereby agree to ratify and confirm all and whatsoever his said attorneys, or either of them, shall lawfully do or cause to be done in the premises.

In witness, &c.

Power of Attorney from one Executor and Trustee to the others to act in his absence.

To all to whom these presents shall come, W. W. of, &c. eldest son and heir-at-law, and also one of the trustees and executors named and appointed in and by the last will and testament of A. W. late of, &c., esq., deceased, sendeth greeting. Whereas the said A. W. in and by his last will and testament in writing, bearing date, &c. after giving and bequeathing several pecuniary and specific legacies, annuities, and bequests to the several persons, and in manner therein mentioned, and charging all his personal estate with the payment thereof, did give all the rest and residue of his personal estates and effects of what nature or kind soever, subject and chargeable as aforesaid, to his (the said testator's) wife F. W., and to his friend W. S. R., his son the said W. W., and his son-in-law E. W. upon the several trusts, and to and for the ends, intents, and purposes therein and hereinafter in part expressed or declared of and concerning the same, viz. in trust (*recite the trusts*). And the said testator did thereby nominate, constitute, and appoint the said F. W., W. S. R., W. W., and E. W., executors of his last will and testament: and whereas the said A. W. departed this life on or about, &c. without having revoked or altered his said last will and testament in all or any of the matters aforesaid; and since his death the said F. W., W. S. R., W. W., and E. W., have all duly proved his said will in the prerogative court of the archbishop of Canterbury, and taken upon themselves the execution thereof; and whereas the said W. W. is about shortly to depart from Great Britain for the East Indies, and is desirous of enabling, so far as he lawfully may, the said other trustees and executors of the said A. W. to act in execution of the trusts of the said will, and in the management and conduct of the estate and affairs of the said testator during his absence, as fully and effectually as if he the said W. W. were present, and actually joining in all and every such act and acts as may be necessary

for that purpose: Now know ye, that in order to carry such the desire of the said W. W. into execution, and for the purposes aforesaid, he the said W. W. hath made, deputed, constituted, and appointed, and by these presents doth make, depute, constitute, and appoint the said F. W., W. S. R., and E. W. and the survivor and survivors of them, to be his true and lawful attorney and attorneys for him the said W. W. in his name and on his behalf, as one of the trustees and executors of the said will of the said A. W., to transact, manage, and negotiate all and singular matters and things whatsoever which in anywise relate to or concern the execution of the said trusts, or the management, disposal, or conduct of the estate and affairs of the said testator; and to that end for him the said W. W., and in his name, and on his behalf, as trustee and executors as aforesaid, to settle and sign, and also, if necessary, to seal, and as his act and deed, in due form of law, to deliver all and every or any account and accounts, releases, receipts, acquittances, deeds, writings, and instruments whatsoever which shall or may be, or to them the said F. W., W. S. R., and E. W. or the survivor or survivors of them, shall seem necessary or expedient for that purpose; and generally to do, execute, and perform, or cause and procure to be done, all and every or any acts, deeds, matters, and things whatsoever, anywise necessary or expedient to be done by or on behalf of him the said W. W., in or about the execution of the trusts aforesaid, or any of them, and the management, disposal, or conduct of the said testator's estate and affairs, or any part thereof; and all and whatever his said attorneys, or any of them, shall do or cause to be done in pursuance of the powers hereby granted, he the said W. W. doth hereby, and at all times hereafter shall and will ratify, confirm, and allow.

In witness, &c.

To receive Bank Stock, and transfer the same.

Know all men, &c. that A. B. and C. his wife (daughter and administratrix of all and singular, the goods, chattels, rights, and credits of — deceased), have constituted and appointed, and by these presents do, &c. D. E. gent. to be their true and lawful attorney for them the said A. B. and C. his wife, and for each of them, in their names, place, and stead, and to the use of the said A. B. to ask and receive all dividends now due, or which shall hereafter accrue or grow due to the said A. B. and C. his wife, or either of them, from the governor and company of the Bank of England; and upon the receipt thereof, or of any part thereof, acquittances or other sufficient discharges to make and give for the same; and also to assign and transfer the sum of —£. in the Bank stock, and all and every other stock and stocks in the said Bank of England, which

they the said A. B. and C. or either of them, have or hath, or as she the said C. is entitled to as administratrix of — deceased, or otherwise to the said A. B. or to such other person or persons as the said A. B. shall order and direct. And further, to do, execute, and perform all and singular deeds, acts, matters, and things which shall be expedient and necessary, touching and concerning the premises, as fully and effectually, to all intents and purposes whatsoever, as they the said A. B. and C. his wife, or either of them, might or could do in or about the same, being personally present; and whatsoever he the said D. E. shall, &c.

In witness, &c.

To accept and pay for and sell Bank Stock.

To accept of all such capital stock in the Bank of England as I have already bought or contracted to buy, or shall hereafter buy, or contract to buy, of any person or persons whatsoever, upon the transferring thereof, according to the usual manner of transferring the said stock, and pay such sum and sums of money, or consideration, for the purchase of all such capital stock, upon the transferring thereof, from time to time as I shall in that behalf order; and likewise for me, and in my name, and on my behalf, and to and for my own proper use, to sell and transfer all or any such stock as I now have, or shall buy or purchase in the said Bank of England, to such person or persons, and in such manner as I shall from time to time direct and appoint, by writing under my hand; and also for my use to receive the monies or considerations which shall become due or payable for or upon the sale of all or any such stock as he shall so sell and transfer for or on my account as aforesaid, and to give sufficient discharges for the same. And I do hereby give and grant, &c.

To execute a Deed of Composition, and to receive a Dividend.

To sign, seal, and execute an indenture tripartite, bearing date, &c. made or mentioned to be made between A. B. and C. of, &c. creditors of F. &c. and trustees for or on the behalf of other the creditors of the said F. of the first part; L. M. N. myself the said O. and P. Q. &c. creditors also of the said F. of the second part; and the said F. of the third part; and also for me, and in my name, and to and for my proper use and behoof, to demand and receive of and from the said A. B. and C. either or any of them, all monies due and payable to me upon and by virtue of the said indenture, as well for my share and dividend of the sum of — £. already received by and in the hands of the said A. B. and C. some or one of them, of the estate of the said F. as of the sum of — £. of the debts of the said L. M. N. yet outstanding and unreceived, or

of so much thereof as shall be recovered and received, in proportion to the debt of — £. owing to me by the said F. And I do hereby give and grant unto my said attorney my whole power and authority in the premises to do and perform all matters and things for the recovery and receiving of the monies due, or which shall become due or payable to me by virtue of the said indenture, as fully as I myself might or could do were I personally present. And I do hereby ratify and confirm the execution of the said indenture by my said attorney, and do undertake and promise to ratify and allow all other legal acts and things which shall be by him done and performed in and about the premises by virtue of these presents.

In witness, &c.

These are examples sufficient to explain the nature of these kinds of instruments.

The stamps necessary to be placed on them respectively by 55 Geo. 3. c. 184. are as follow:

Letter or power of attorney, made by any petty officer, seaman, marine, or soldier, for receiving prize-money	-	0	1	0
And for receiving wages	-	1	0	0
Letter of attorney for the sale, transfer, acceptance, or receipt of dividends, of any of the government or parliamentary stocks or funds	-	1	0	0
Letter or power of attorney of any other kind	-	1	10	0
And for every 1080 words, above the first	-	1	0	0
Letter of Licence from creditors to a debtor	-	1	15	0
And for every 1080 words above the first	-	1	5	0
Letter of marque and reprisal	-	5	0	0

LETTER of Credit, is where a merchant or correspondent writes a letter to another, requesting him to credit the bearer with a certain sum of money. The bearer of this letter generally gives security to repay the sums he shall take up in pursuance of its contents.

LETTER of Licence, is a written permission granted to a person under embarrassment allowing him to conduct his affairs for a certain time without being molested. Such instrument will bind all the creditors by whom it is executed, and it generally contains certain stipulations to be observed by all parties.

LETTERS of Marque, are extraordinary commissions, granted to captains or merchants for reprisals, in order to make a reparation for those damages they have sustained, or the goods they have been deprived of by strangers at sea. These appear to be always joined to those of reprise, for the reparation of a private injury; but under a declared war the former only are required.

LETTERS Patent. See **PATENTS**.

LETTERS, Threatening, are that sort of private letters of which the law takes es-

pecial cognizance. By 9 Geo. 1. c. 22., amended by 27 Geo. 2. c. 15. knowingly to send any letter without name, or with a fictitious name, demanding money, &c. or threatening, without any demand, to kill, or fire the house of, any person, is made felony *sans* clergy. By 30 Geo. 2. c. 24. persons sending with, or without a name, or with a fictitious name, threatening to accuse any one of a crime punishable by law with death, transportation, pillory, or other infamous punishment, in order to extort money or goods, shall be punished at the discretion of the court, by fine and imprisonment, pillory, whipping, or transportation for seven years.

LETTER-FOUNDER, is the mechanic who cuts, casts, &c. letters for printing. This is an ingenious art, and requires a great variety of tools; as vices, hand-vices, hammers, and files of all descriptions, such as are used by watchmakers, also gravers and sculptors, suitable to the several letters intended to be cut, a flat-gauge, sliding-gauge, face-gauge, &c. There cannot be less than three gauges; the gauge for the long letters must be the length of the whole body, supposed to be divided into forty-two equal parts. The gauge for the ascending letters, Roman and Italic, are five-sevenths, or thirty parts of forty-two, and thirty-three parts for the English face. The gauge for the short letters is three-sevenths, or eighteen parts of forty-two of the whole body for the Roman and Italic, and twenty-two parts for the English face. The Italic and other standing gauges are to measure the scope of the Italian stems, by applying the top and bottom lines of the letters, and the other side of the gauge to the stem; for when the letter complies with these three sides of the gauge, such letter has its true shape. The next care of the letter-cutter is to prepare good steel punches well tempered and quite free from all veins of iron, on the face of which he draws or marks the exact shape of the letter with pen and ink if the letter be large; or with the smooth blunted point of a needle, if it be small; and then with size and properly shaped and pointed gravers and sculptors, digs or sculps out the steel between the strokes or marks he made on the face of the punch, and leaves the marks standing on the face. Having well shaped the inside strokes of his letter, he deepens the hollows with the same tools; for if a letter be not deep in proportion to its width, it will, when used at press, print black, and be good for nothing. This work is generally regulated by the depth of the counter-punch. Then he works the outside with proper files till it be fit for the matrice. The sinking and justifying of the matrice is performed by a mould adapted to the purpose, which must previously be justified. A matrice is a piece of brass or copper about an inch and a half long, and of a thickness

proportioned to the size of the letter it is to contain. In this metal is sunk the face of the letter intended to be cast, by striking the letter punch about the depth of an *n*; after this the sides and face of the matrice must be justified and cleaned with files, of all punchings made by sinking the punch.

Every thing thus prepared, it is brought to the furnace, which is built of brick upright, with four square sides, and a stone on the top, in which stone is a wide round hole for the pan to stand in.

A foundry of any consequence has several of these furnaces.

In extensive foundries, the metal of which the types is to be cast, is always prepared in large quantities; but cast into bars of about twenty pounds weight, to be delivered out to the workmen as occasion requires.

The metal of which types are formed is lead, with a mixture of the regulus of antimony, or any other such substance as the letter-founder approves. These being duly mixed and melted in a large cauldron of cast-iron, by continued stirring with an iron ladle, the workmen proceed to draw the metal off into small troughs of cast-iron, which are ranged on a level platform faced with stone.

Fifteen hundred weight of metal can be prepared in this manner in the course of a day.

The founder must now be provided with a ladle, differing from all other ladles only in its size, which is adapted to that of the letter he has to cast; but before he begins this operation, he must kindle the fire in the furnace, to melt the metal in the pan.

If it be a small-bodied letter, or a thin letter with great bodies that he intends to cast, his metal must be very hot, and sometimes red-hot to make the letter come; then taking a ladle that will hold as much as will make the letter and break, he lays it to the hole where the flame bursts out, to heat; then he ties a thin leather, cut with its narrow end against the face, to the leather groove of the matrice, by whipping a brown thread twice about the leather groove, and fastening the thread with a knot.

He next puts both pieces of the mould together, and the matrice into the matrice cheek, and places the foot of the matrice on the stool of the mould, and the broad end of the leather on the wood of the upper half of the mould, but not tight up, lest it should hinder the foot of the matrice from sinking close down upon the stool in a train of work.

Afterward laying a little rosin on the upper part of the mould, and having his casting ladle hot, he, with the boiling side, melts the rosin, and presses the broad end of the leather hard down upon the wood, and so fastens it thereto.

In the act of casting, placing the under half of the mould in his left hand, with the

hook or jag forward, he holds the ends of its wood between the lower part of the ball of his thumb and his three hinder fingers; then he lays the upper half of the mould upon the under half; and at the same time the foot of the matrice places itself upon the stool, and claspings his left-hand thumb strongly over the upper half, he nimbly catches hold of the bow or spring with his right-hand fingers at the top, and his thumb under it, and places the point of it against the middle of the notch in the reverse side of the matrice, pressing it forward as well toward the mould as downward, by the shoulder of the notch, close upon the stool, while at the same time with his hands or fingers he draws the under half of the mould towards the ball of his thumb, with which he thrusts the upper part toward his fingers, that both the registers of the mould may press against both sides of the matrice, and his thumb and fingers press both sides of the mould closely together.

He next takes the handle of his ladle in his right-hand, and with the ball of it gives two or three strokes outwards upon the surface of the melted metal to clear it of the scum; then he takes up the ladle full, and having the mould in his left hand, turns his left side a little from the furnace, and brings the jet of his ladle to the mouth of his mould, and turns the upper part of his hand towards him, to pour the metal into it, while at the same instant he puts the mould in his left hand forwards, to receive the metal with a strong shake, not only into the bodies of the mould, but while the metal is yet hot, into the very face of the matrice, to receive its perfect form there as well as in the shank.

He then takes off the upper half of the mould by placing his right thumb on the end of the wood next his left thumb, and his two middle fingers at the other end of the wood; he tosses the letter, break and all, upon a sheet of waste paper laid on a bench a little beyond his left hand, and then is ready to cast another letter as before, and likewise the whole number in that matrice.

After this, boys who are commonly employed for this purpose, separate the breaks from the shanks, and rub them on a stone, and afterwards a man cuts them all of an even height, which finishes the fount for the use of the printer.

A workman will ordinarily cast 3000 of these letters per day.

The perfection of these letters consists in their being severally square and straight on every side, all of the same height, and evenly lined, without stooping one way or other; neither too big in the foot nor the head, well grooved, so as the two extremes of the foot contains half the body of the letter, and well ground, barbed, and scraped with a sensible notch.

LEVIGATION, the mechanical process

of grinding the parts of bodies to a fine paste, by rubbing the flat face of a stone called the muller, upon a table or slab called the stone. Some fluid is always added in this process. The advantage of levigation with a stone and muller, beyond that of triturating in a mortar, is that the materials can more easily be scraped together, and subjected to the action of the muller, than in the other case to that of the pestle; and from the flatness of the two surfaces, cannot elude the pressure.

LIARD, a French copper coin, equivalent to 1s. 3d. sterling.

LIBEL, (*libellus*.) signifies literally a little book.

With regard to libels in general, there are, as in many other cases, two remedies; one by *indictment*, and another by *action*. The former for the public offence; inasmuch as every libel has a tendency to break the peace, or provoke others to break it: which offence is the same, whether the matter contained be true, or false; and therefore, the defendant, on an indictment for publishing a libel, is not allowed to allege the truth of it by way of justification. (5 Rep. 125.) But in the remedy by action on the case, which is to repair the party in damages for the injury done him, the defendant may, as for words spoken, justify the truth of the facts, and show that the plaintiff has received no injury at all. (11 Mod. 99.) The same rule holds in every particular with regard to libels by writing or printing, and the civil actions consequent thereupon, as in regard to words spoken; but as to signs or pictures, it seems necessary always to show, by proper *innuendoes* and averments of the defendant's meaning, the import and application of the scandal, and that some special damage has followed; otherwise it cannot appear, that such libel by picture was understood to be levelled at the plaintiff, or that it was attended with any actionable consequences.

These *libels*, taken in their largest and most extensive sense, signify any writings, pictures, or the like, of an immoral or illegal tendency; they are malicious defamations of any person, and especially a magistrate, made public by either printing, writing, signs, or pictures, in order to provoke him to wrath, or expose him to public hatred, contempt and ridicule. (1 Hawk. P. C. 193.) The direct tendency of these libels is the breach of the public peace, by stirring up the objects of them to revenge, and perhaps to bloodshed. The communication of a libel to any one person is a publication in the eye of the law; and therefore, the sending an abusive private letter to a man, is as much a libel as if it were openly printed, for it equally tends to a breach of the peace. (1 Hawk. P. C. 195.) For the same reason it is immaterial with respect to the essence of a libel, whether the matter of it be true or false; since the provocation

and not the falsity, is the thing to be punished criminally: though, doubtless, the falsehood of it may aggravate its guilt, and enhance its punishment. For though, in a civil action, the truth of the accusation may be pleaded in bar of the suit; yet, in a criminal prosecution, the tendency which all libels have to create animosities, and to disturb the public peace, is the whole that the law considers. And therefore in such prosecutions, the only points to be enquired into are, first, the making or publishing of the book or writing; and, secondly, whether the matter be criminal: and, if both these points are against the defendant, the offence against the public is complete.

But, though it has been held for more than two centuries, that the truth of a libel is no justification in a criminal prosecution, yet in many instances it is considered an extenuation of the offence; and the court of king's bench has laid down this general rule, viz. that it will not grant an information for a libel, unless the prosecutor who applies for it, makes an affidavit, asserting directly and pointedly, that he is innocent of the charge imputed to him. But this rule may be dispensed with, if the person libelled resides abroad, or if the imputations of the libel are general and indefinite, or if it is a charge against the prosecutor for language which he has held in parliament. *Doug.* 271. 572.

A person may be punished for a libel reflecting on the memory and character of the dead, but it must be alleged, and proved to the satisfaction of the jury, that the author intended by the publication to bring dishonour and contempt on the relations and descendants of the deceased. 4 *T. R.* 261.

And it has been holden not to be a libel to publish a correct copy of the reports or resolutions of the two houses of parliament, or a true account of the proceedings of a court of justice. "For though (as Mr. Justice Lawrence has well observed) the publication of such proceedings may be to the disadvantage of the particular individual concerned, yet it is of vast importance to the public that the proceedings of courts of justice should be universally known. The general advantage to the country in having these proceedings made public, more than counterbalances the inconveniences to the private persons, whose conduct may be the subject of such proceedings." *R. v. Wright*, 8 *T. R.* 293. But this doctrine must be received with great limitations; for in *R. v. Creevy*, 53 *Geo. 3.* it was decided, that an editor cannot report a libellous speech, though accurately copied, and even corrected by the author of it himself, without being responsible for the libellous matters contained in it.

It had frequently been determined by the court of king's bench, that the only questions for the consideration of the jury, in criminal prosecutions for libels, were the fact

of publication, and the truth of the innuendoes, that is, the truth of the meaning and sense of the passages of the libel, as stated and averred in the record, and that the judge or court alone were competent to determine whether the subject of the publication was or was not a libel. (3 *T. R.* 428.) But the legality of this doctrine having been much controverted, the 32 *Geo. 3. c. 60.* was passed, intituled, *An act to remove doubts respecting the functions of juries in cases of libels.* And it declares and enacts, that on every trial of an indictment or information for a libel, the jury may give a general verdict of guilty, or not guilty, upon the whole matter in issue, and shall not be required or directed by the judge to find the defendant guilty, merely on the proof of the publication of the paper charged to be a libel, and of the sense ascribed to it in the record. But the statute provides, that the judge may give his opinion to the jury respecting the matter in issue, and the jury may at their discretion, as in other cases, find a special verdict, and the defendant, if convicted, may move the court as before the statute, in arrest of judgment.

The sale of the libel by a servant in a shop, is *prima facie* evidence of publication in a prosecution against the master, and is sufficient for conviction, unless contradicted by contrary evidence, showing that he was not privy, nor in any degree assenting to it. 5 *Burr.* 2686.

When a person is brought to receive judgment for a libel, his conduct, subsequent to his conviction, may be taken into consideration, either by way of aggravation or mitigation of the punishment. (3 *T. R.* 432.) By stat. 60 *Geo. 3.* and 1 *Geo. 4. c. 8.* a second conviction for a blasphemous libel, or for a seditious libel, intending to bring the king, either house of parliament, &c. into contempt, renders the offender liable to banishment; and the court, on conviction, may order the copies of the libel, in the possession of the party convicted, to be destroyed.

LICENCE. By the excise laws, licences are necessary for the carrying on various trades, upon which the following duties are paid to government for that purpose: viz.

Auctioneers, 12s.

Brewers of table beer, 2l.

Brewers of strong beer, if the quantity brewed within the year ending the 5th day of July in each year, previous to taking out the licence, shall not exceed 1000 barrels, 2l. 5s.

From 1000 barrels to 2000 barrels, 3l.

From 2000 barrels to 5000 barrels, 7l. 10s.

From 5000 barrels to 7500 barrels, 11l. 15s.

From 7500 barrels to 10,000 barrels, 15l.

From 10,000 barrels to 20,000 barrels, 30l.

From 20,000 barrels to 30,000 barrels, 45l.

From 30,000 barrels to 40,000 barrels, 60*l*.

Exceeding 40,000 barrels, 75*l*.

Every person who shall first become a common brewer of strong beer, for every such licence 1*l*. 10*s*.; and within ten days after the 5th day of July next after taking out such licence, such further additional sum as, with the said 1*l*. 10*s*. shall amount to the duty hereinbefore directed to be paid, according to the number of barrels of strong beer brewed within the preceding year, 2*l*. 5*s*. and surcharge.

Makers of wax or spermaceti candles for sale, 12*l*.

Dealers in ditto candles, 21*s*.

Chandlers, or makers of candles, 2*l*.

Persons trading in coffee, tea, cocoa-nuts, or chocolate, 11*s*.

Glass-makers, for each glass-house, 20*l*.

By 58 Geo. 3. c. 33. drop pinchers, in the glass trade, observing certain regulations, exempt from taking out licence.

Tanners in the bills of mortality, 10*l*.

Other tanners, 5*l*.

Tawers, 2*l*.

Dressers of hides and skins in oil, 4*l*.

Curriers, 4*l*.

Makers of vellum or parchment, 2*l*.

Maltsters, if the quantity of malt, within the year ending the 5th day of July in each year, previous to taking out the licence, shall not exceed 50 quarters, 7*s*. 6*d*. and surcharge.

From 50 quarters to 100 quarters, 15*s*.

From 100 qrs. to 150 qrs. 1*l*. 2*s*. 6*d*.

From 150 qrs. to 200 qrs. 1*l*. 10*s*.

From 200 qrs. to 250 qrs. 1*l*. 17*s*. 6*d*.

From 250 qrs. to 300 qrs. 2*l*. 5*s*.

From 300 qrs. to 350 qrs. 2*l*. 12*s*. 6*d*.

From 350 qrs. to 400 qrs. 3*l*.

From 400 qrs. to 450 qrs. 3*l*. 7*s*. 6*d*.

From 450 qrs. to 500 qrs. 3*l*. 15*s*.

From 500 qrs. to 550 qrs. 4*l*. 2*s*. 6*d*.

Exceeding 550 quarters, 4*l*. 10*s*.

Persons who shall first become maltsters, for every licence, 7*s*. 6*d*.; and within ten days after the 5th day of July next after taking out such licence, such further additional sum as, with the said 7*s*. 6*d*. shall amount to the duty hereinbefore directed to be paid, according to the quantity of malt made within the preceding year, 7*s*. 6*d*. and a surcharge.

Makers of metheglin or mead for sale, 2*l*.

Paper or pasteboard makers, and paper stainers, 4*l*.

Persons trading in gold or silver plate, or any goods or wares in which any quantity of gold exceeding two pennyweights, and under two ounces in weight, or any quantity of silver exceeding five pennyweights, and under 30 ounces in weight, in any one separate and distinct ware or piece of goods, is manufactured, 4*l*. 12*s*.

Persons trading in any gold or silver plate, or any goods or wares in which any

quantity of gold of the weight of two ounces or upwards, or any quantity of silver of the weight of thirty ounces or upwards, in any one separate and distinct ware or piece of goods shall be manufactured: and every pawnbroker trading in, vending, or selling gold or silver plate, or goods or wares in which any quantity of gold or silver is manufactured, or taking in or delivering out pawns of such plate, goods, or wares: and every refiner of gold or silver, 11*l*. 10*s*.

Calico printers, and printers, painters, or stainers of linen, cotton, or stuff, 20*l*.

Makers of soap for sale, 4*l*.

Distillers or makers of low wines or spirits for sale or for exportation in England, 20*l*.

Rectifiers of spirits in England, 10*l*.

Dealers in brandy or other spirituous liquors or strong waters, 10*l*.

Persons in Scotland, who shall, by wholesale, deal in spirits made from malt, corn, grain, barley, beer, bigg, or other British materials, not being licensed distillers, or dealers in brandy, for every such licence to sell plain aqua vitæ only by wholesale, 3*l*.

Retailers of distilled spirituous liquors, or strong waters, in Great Britain, made from British materials, in Scotland, for every licence, if the dwelling-house in which such retailer shall reside, shall not, together with the offices, courts, yards, and gardens therewith occupied, be rated under the authority of any act or acts of parliament for granting duties on inhabited houses, at the rent of 15*l*. per annum or upwards, 5*l*. 5*s*.

Fifteen pounds or upwards, and under 20*l*. 6*l*. 6*s*.

At 20*l*. and under 25*l*., 8*l*. 5*s*.

At 25*l*. and under 30*l*. 8*l*. 17*s*.

At 30*l*. and under 40*l*. 9*l*. 9*s*.

At 40*l*. and under 50*l*. 10*l*. 1*s*.

At 50*l*. per annum or upwards, 10*l*. 15*s*.

Persons in any part of Scotland, except the Highlands, retailing any spirits distilled from malt, corn, grain, barley, bere, bigg, or other British materials, called aqua vitæ, for every licence to retail plain aqua vitæ only, 2*l*.

Persons who shall retail such spirits within the several counties and districts of the Highlands of Scotland, the royal burghs, burghs of barony or regality therein excepted, 1*l*.

Starch-makers, 10*l*.

Maker of any kind of sweets, or made wines, other than mead, for sale, 10*l*.

Retailers of British made wines or sweets, 4*l*. 8*s*.

Manufacturers of tobacco or snuff, if the tobacco and snuff work weighed by such person for manufacture, within the year ending on the 10th day of October, previous to taking out the licence, shall not have exceeded 20,000 lbs. weight, 3*l*. and surcharge.

If not exceeding 30,000 lbs. weight, 4*l.* 10*s.*

Not exceeding 40,000 lbs. 6*l.*

Not exceeding 50,000 lbs. 7*l.* 10*s.*

Not exceeding 60,000 lbs. 9*l.*

Not exceeding 70,000 lbs. 10*l.* 10*s.*

Not exceeding 80,000 lbs. 12*l.*

Not exceeding 90,000 lbs. 13*l.* 10*s.*

Not exceeding 100,000 lbs. 15*l.*

Not exceeding 120,000 lbs. 18*l.*

Not exceeding 150,000 lbs. 22*l.* 10*s.*

If exceeding 150,000 lbs. 30*l.*

Every person who shall first become a manufacturer of tobacco or snuff, for every such licence, 3*l.* and within ten days after the 10th day of October next after taking out such licence, such further additional sum, as with the said 3*l.* shall amount to the duty hereinbefore directed to be paid, according to the quantity of tobacco and snuff work weighed for manufacture within the preceding year, 5*l.* and a surcharge.

Dealers in tobacco or snuff, within the limits of the chief office of excise in London or Edinburgh, for every such licence, 10*s.*

Ditto, in any other part of Great Britain, 5*s.*

Vinegar-makers, for sale, 1*l.*

Retailers of foreign wine in England, who shall not have an excise licence for retailing distilled spirituous liquors or strong waters, or a licence for the retailing of beer, ale, or other exciseable liquors, 10*l.* 8*s.*

Retailers of foreign wine in England, who shall have taken out a licence for retailing beer, ale, and other exciseable liquors, but shall not have an excise licence for retailing distilled spirituous liquors or strong waters, 8*l.* 8*s.*

Retailers of foreign wine in England, who shall have an excise licence for retailing distilled spirituous liquors or strong waters, 4*l.* 8*s.*

Retailers of foreign wine in Scotland, who shall not have an excise licence for retailing distilled spirituous liquors or strong waters, or a licence for retailing beer, ale, or other exciseable liquors, 3*l.* 6*s.* 8*d.*

Retailers of foreign wines in Scotland, who shall have taken out a licence for retailing beer, ale, or other exciseable liquors, but not for retailing distilled spirituous liquors or strong waters, 2*l.* 13*s.* 4*d.*

Retailers of foreign wine in Scotland, who shall have an excise licence for retailing distilled spirituous liquors or strong waters, 1*l.* 6*s.* 8*d.*

Wire-drawers of gilt or silver wire, called big wire, in Great Britain, 4*l.*

Makers of oxygenated muriatic acid, or oxymuriate of lime, 5*l.*

LICHEN, or LIVERWORT, a species of moss growing among rocks and on trees, and principally found in different parts of France, and in the Canary, and Cape de Verd, islands. There are several species of this genus, which are useful in the arts, particularly dyeing, and also as food or medicine.

The lichen *clavatum* or *alpinum* is said to give to wool a fine orange, superior to that of annotta. The lichen *cinereus* does the same. The *chlorinus* gives a bright yellow, and the *vulpinus* a lemon colour. Lord Dundonald took out a patent for the use of lichen as a substitute for gum. The lichen, for this purpose, is scalded two or three times with boiling water, to remove the outer skin or resinous matter, washed in cold water, and then left ten or twelve hours on a stone or brick floor; after which the gum is extracted by boiling some hours in water, with about half or three quarters of an ounce of alkali to each pound of lichen. For an account of LICHEN ISLANDICUS, see ICELAND MOSS.

LIEN, a claim or attachment to any property which a person has in his possession, for a debt due to him from the owner of the property.

LIFE ESTATES, are of two kinds; viz. such as are created by the act of the parties; and such as are created by operation of law, as estates by the courtesy of England, and by dower. Estates for life, created by deed or grant, are where a lease is made of lands or tenements to a man, to hold for the term of his life, or for the life or lives of others, in any of which cases he is called a "tenant for life." 2 *Black. Com.* 120. Such estates (for life) are, in the common acceptance of the term, *freeholds*, and confer the right of voting for members of parliament; while estates for years, be the length of the term what it may, confer only a chattel interest, and do not give the right of suffrage.

LIFE INSURANCE. See title INSURANCE.

LIGHTER, a large heavy boat into which ships are *lightened*, or unloaded, the manager of which is called a *lighterman*; and the money paid for conveyance thereby is called *lighterage*.

LIGHT-HOUSE, is a marine term for a tower, advantageously situate on an eminence upon the sea-coast, or at the entrance of some port or river, for the direction of ships in dark nights, by means of some sort of illumination, as fire, candle, or lamp. We have many on our coasts, and light duties for the support of them are payable by stat. 4 & 5 Anne, c. 20. and 8 Anne, c. 17.; by which custom-house officers are prohibited from making out any cocket or other discharge, or taking any report outwards for any ship until the duties for this purpose are paid, and the master shall have produced a light-bill testifying the receipt thereof.

And it shall be lawful for every person authorised by the Trinity House, to go on board any foreign ship to receive the duties, and for non-payment to distrain the tackle of the ship; and in case of delay of payment for three days after distress, the receivers of

the said duties shall cause the same to be appraised by two persons, and to sell the distress.

British-built ships, the property of British subjects, sailing from foreign port to foreign port, and not touching at any place in Great Britain, are not liable to these duties. 3 Term R. 768.

LIGNUM VITÆ. (GER. *Pockholz*. DU. *Pokhout*. DA. *Pokkentree*, *Fransostræe*. SW. *Pockenholts*, *Fransosenholts*. FR. *Gayac*, *Bois saint*. IT. *Guajaco*, *Legno santo* *Legno*. SP. *Guayaco*, *Palo santo*. PORT. *Guajaco*, *Páo sancto*. RUS. *Bakaut*. POL. *Gwaiak*. LAT. *Guaiacum*.) This species of wood is of great utility, as well for turnery, as in pharmacy. The tree which produces it grows in most of the West India islands, but especially in Hayte, and Sainte Croix. The wood of this tree ought to be chosen solid, compact, and ponderous; its general colours are dark green, black, and brown, interiorly, though on the outside it is usually of a pale yellow, like box-wood. It has a bitterish taste, and affects the mouth with a slight degree of acrimony; its odour is remarkably aromatic and pungent, and not disagreeable when the wood is burnt. It is generally covered with a ligneous, thin, compact, shining bark, of a lead-colour without, and livid internally. The bark is resinous and extremely caustic. The resin extracted from *lignum vitæ*, is employed with the utmost success as a medicine. See **GUAIAIACUM**.

LILAC. The yellowish and red-streaked wood of old lilac-trees is valuable to turners and cabinet-makers, as the vessels and utensils made of it are equal to those made of olive-wood. By immersing such articles in aqua-fortis, largely diluted with water, they acquire a fine red colour.

LILY OF THE VALLEY. A beautiful green colour may be prepared from the leaves of this plant with the addition of lime.

LIME, (GER. DU. DA. and SW. *Kalk*. FR. *Chaux*. IT. *Calcina*, *Calce*. SP. and PORT. *Cal*. RUS. *Iswest*. POL. *Wapno*. LAT. *Calx*.) one of those earthy substances, which exist in every part of the known world. It is found purest in limestone, marble, and chalk. None of the substances are lime, but are capable of becoming so by burning in a white heat.

Lime may be also obtained perfectly pure by burning those crystallized limestones called calcareous spars, which are perfectly white and transparent, and also by burning some pure white marbles. It may be procured also in a state of purity by dissolving oyster-shells in muriatic acid, filtering the solution, mixing it with ammonia as long as a white powder continues to fall, and filtering again. The liquid is now to be mixed with a solution of carbonat of soda: the powder which falls being washed and dried,

and heated violently in a platinum crucible, is pure lime.

Pure lime is of a white colour, moderately hard, but easily reduced to a powder. It has a hot burning taste, and in some measure corrodes and destroys the texture of those animal bodies to which it is applied. Its specific gravity is 2.3. It tinges vegetable blues green, and at last converts them to yellow.

If water be poured on newly burnt lime, it swells and falls to pieces, and is soon reduced to a very fine powder. In the mean time so much heat is produced, that part of the water flies off in vapour. If the quantity of lime slacked (as this process is termed) be great, the heat produced is sufficient to set fire to combustibles. In this manner, vessels loaded with lime have sometimes been burnt. When great quantities of lime are slacked in a dark place, not only heat but light also is emitted, as Mr. Pelletier has observed. When slacked lime is weighed, it is found to be heavier than it was before. This additional weight is owing to the combination of part of the water with the lime; which water may be separated again by the application of red heat; and by this process the lime becomes just what it was before being slacked.

Lime will become slacked, after a certain length of time, on mere exposure to the atmosphere under ordinary circumstances, from its absorbing the water diffused through that medium; a further change also takes place consequent on its great affinity for carbonic acid, by which it attracts a portion of that contained in the air, and thence becomes changed into a white, insipid powder, termed *chalk*. This may be again reduced to pure lime by the action of fire.

One of the most important uses of lime, is in the formation of mortar as a cement in building. Mortar is composed of quicklime and sand, reduced to a paste with water.

The lime ought to be pure, completely free from carbonic acid, and in the state of a very fine powder: the sand should be free from clay, and partly in the state of fine sand, partly in that of gravel; the water should be pure; and if previously saturated with lime, so much the better. The best proportions, according to the experiments of Dr. Higgins, are three parts of fine, and four parts of coarse sand, one part of quicklime, recently slacked, and as little water as possible.

The stony consistence which mortar acquires, is owing partly to the absorption of carbonic acid, but principally to the combination of part of the water with the lime. This last circumstance is the reason that if to common mortar one-fourth part of lime, reduced to powder without being slacked, is added, the mortar, when dry, acquires much greater solidity than it otherwise

would do. This was first proposed by Lorient; and a number of experiments were afterwards made by Morveau. The proportions which this philosopher found to answer best are the following:

Fine sand	-	-	0.5
Cement of well-baked bricks	-	-	0.5
Slacked lime	-	-	0.2
Unslacked lime	-	-	0.2
			1.0

The same advantages may be attained by using as little water as possible in slacking the lime.

Higgins found that the addition of burnt bones improved mortar by giving it tenacity, and rendering it less apt to crack in drying; but they ought never to exceed one-fourth of the lime employed.

When a little manganese is added to mortar, it acquires the important property of hardening under water; so that it may be employed in constructing those edifices which are constantly exposed to the action of water. Limestone is often combined with manganese: in that case it becomes brown by calcination.

Another of the important uses to which lime is applied, is as manure to land. Every day produces some new proof of its general utility in this capacity, but every day also exhibits some new light in which its application may be viewed. It is applicable in different states to different kinds of soils, and to soils under different states of cultivation. Quite fresh, or, as it is called, *quick*, it is caustic, and will not do well on grass land; after it has long been exposed to the atmosphere and become mild, it will not forward sufficiently the process of putrefaction of the vegetables it meets with, and will be little productive. There are also limes of different essential qualities in their own nature, and on these differences their application, to be useful, must materially depend. Philosophers divide lime into two kinds, magnesian and calcareous. The former can only be useful in any considerable quantity on arable land, and even on that its good effects are problematical. The latter is salutary both on arable, and on grass land; and if the soil on which it is laid be any thing but chalk, it will bear to be abundantly applied. The finer it is pulverized the better, especially on grass, and it should neither be used so fresh from the kiln as to be extremely caustic, nor so long after being burnt as to have run into lumps, and altogether have lost its caustic quality. On fallows it will bear being laid even hot from the kiln, as it will not only destroy slugs and worms the better, and reduce them to mucilage, but will reduce weeds and other vegetable matters to a state of putrefaction.

When sheep have the common complaint denominated the *foot halt*, by driving them

over a heap of caustic lime fresh from the kiln, a cure will frequently be effected.

LIME, *Bird*. See BIRD-LIME.

LIME, or LINDEN-TREE. (GER. and DU. *Linde*. DA. *Lindetræe*. SW. *Lind*. FR. *Tilleuil*. IT. *Tiglio*. SR. *Tilo*, *Tila*, *Tilon*. PORT. *Til*. RUS. and POL. *Lipa*. LAT. *Tilia*.) There are four species; the *europea*, *americana*, *pubescens*, and *alba*. The *europea*, or common lime-tree, is generally supposed to have been imported into England before the year 1652. The wood is light, smooth, and of a spongy texture, used for making lasts, and tables, for shoe-makers, curriers, &c. Ropes and bandages are made of the bark, and mats and rustic garments of the inner rind, in Carniola and some other countries. It is said that the linden cordage, made in some parts of Russia, is so remarkably strong and elastic, that in this respect it is superior to iron chains. The lime-tree contains a gummy juice, which being repeatedly boiled and clarified, produces a substance like sugar.

This tree is remarkable for those excrescences or *galls*, which appear on the edges of its leaves during the spring; these are of a reddish colour, and by being rubbed on linen, they are said to have imparted a beautiful red colour, which was not discharged, although it had been washed several times: hence it is probable that *lime-galls* might be rendered valuable in dyeing.

The wood of the lime-tree makes also excellent charcoal for drawing, or for the manufacture of gunpowder.

LIMES, a species of lemon, which grows in abundance in most of the West India islands, and is also to be met with in some parts of France, especially in Provence, as well as in Spain and Portugal. The lime is much smaller than the lemon, its rind is usually thinner, and its colour, when the fruit arrives at a perfect state of maturity, is a fine bright yellow. It is uncommonly juicy, and the flavour of its substance is esteemed far superior to that of the lemon. In Egypt a prodigious quantity of limes, each about the size of a walnut, and abounding in juice, with a remarkably smooth rind, is annually (sometimes biennially) gathered. The Egyptians make use of the juice as vinegar, and consume much of it in making sherbet, a favourite beverage in the Levant, and the neighbouring countries. They likewise send large quantities of lime-juice to Constantinople and Venice, always taking care to let the juice clarify prior to its being barrelled and shipped. There is, besides that just spoken of, another kind of *limes* common in Egypt, which is large, has uncommonly thick rind, and scarcely any juice. These limes are usually either preserved or made into marmalade. The West India lime is occasionally preserved green.

LIMITATION, a certain time prescribed by statute, within which an action must be brought. The time of limitation is two-fold; first in writs, by divers acts of parliament; secondly to make a title to any inheritance, and that is by the common law.

Limitation on penal statutes.—All actions, suits, bills, indictments, or informations, which shall be brought for any forfeiture upon any penal statute, made or to be made, whereby the forfeiture is, or shall be, limited to the queen, her heirs or successors only, shall be brought within two years after the offence committed, and not after two years; and all actions, suits, bills, or informations, which shall be brought for any forfeiture upon any penal statute made or to be made, except the statutes of tillage, the benefit and suit whereof is or shall be by the said statute limited to the queen, her heirs or successors, and to any other that shall prosecute in that behalf, shall be brought by any person that may lawfully sue for the same, within one year next after the offence committed; and in default of such pursuit, then the same shall be brought for the queen's majesty, her heirs or successors, any time within two years, after that year is ended: and it is provided that where a shorter time is limited by any penal statute, the prosecution must be within that time. 31 Eliz. c. 5.

Limitation in regard to personal actions of assault and battery, and actions arising upon contract and trespass.

All actions of trespass, of assault, battery, wounding, imprisonment, or any of them, shall be commenced and sued within four years next after the cause of such actions or suits, and not after. 21 Jac. 1. c. 16.

Actions of account, &c.—All actions of trespass *quare clausum fregit*, all actions of trespass, detinue, trover, and replevin, all actions of account, and upon the case, (other than such accounts as concern the trade of merchandise,) between merchant and merchant, all actions of debt grounded upon any lending, or contract without speciality, (that is, not being by deed or under seal,) all actions of debt for arrears of rent, and all actions of assault, menace, battery, wounding, and imprisonment, shall be commenced within the time and limitation as followeth, and not after; that is to say, the said actions upon the case (other than for slander), and the said actions for trespass, debt, detinue, and replevin, and the said actions for trespass *quare clausum fregit*, within six years, after the cause of such action. 21 Jac. c. 16.

Exception in relation to infants.—It has been holden, that if an infant during his infancy, by his guardian bring an action, the defendant cannot plead the statute of limitation, although the cause of action accrued six years before; and the words of the statute are, that after his coming of age, &c.

Exception in relation to merchants' ac-

counts.—As to this exception, it has been matter of much controversy, whether it extends to all actions and accounts relating to merchants and merchandise, or to actions of account open and current only. But it is now settled, that accounts open and current only are within the statute; and that therefore, if an account be stated and settled between merchant and merchant, and a sum certain agreed to be due to one of them, if in such case, he to whom the money is due do not bring his action within the limited time, he is barred by the statute. 2 Mod. 312.

Exception in relation to persons beyond sea.—It seems to have been agreed that the exception as to persons being beyond sea, extends only where the creditors or plaintiffs are so absent, and not to debtors or defendants, because the first only are mentioned in the statute; and this construction has the rather prevailed, because it was reputed the creditor's folly, that he did not file an original, and outlaw the debtor, which would have prevented the bar of the statutes. If one of two plaintiffs be abroad, and the other be in England, the action must be brought within six years after cause of action. *Perry v. Jackson*, 4 Term R. 516.

Executor or administrator.—If A. receives money belonging to a person who afterwards died intestate, and to whom B. takes out administration, and brings an action against A., to which he pleads the statute of limitations, and the plaintiff replies, and shows that administration was committed to him such a year, which was within six years; though six years are expired since the receipt of the money, yet not being so since the administration committed, the action is not barred by the statute. 1 Salk. 421.

Where a debt barred by the statute shall be revived.—Any acknowledgment of the existence of the debt, however slight, will take it out of the statute, and the limitation will then run from that time: and where an expression is ambiguous, it shall be left to the consideration of the jury, whether it amounts or not to such acknowledgment. *Lloyd v. Maund*, 2 Term R. 760.

It is clearly agreed, that if after the six years, the debtor acknowledges the debt, and promise payment, that this revives it, and brings it out of the statute: as if a debtor by promissory note, or simple contract, promises within six years of the action brought, that he will pay the debt; though this was barred by the statute, yet it is revived by the promise. 1 Salk. 28. Evidence was, that "defendant acknowledged his acceptance of a bill, and that he *had been liable*, but that he was not liable *then*, because it was out of date:" this was holden sufficient to take the case out of the statute. *Leapor v. Tatton*, 16 E. R. 420.

LINDEN-TREE. See LIME-TREE.

LINE, denotes a French measure, containing the 12th part of an inch, or the 144th

part of a foot. Geometricians conceive the line subdivided into six points. The French line answers to the English barley-corn.

LINEN. (GER. *Linnen*, *Leinwand*. DU. *Lynwaat*. DA. *Læred*. SW. *Linneräf*, *Linne*. FR. *Toile*. IT. *Tela*, *Panno lino*. SP. *Lienzo*, *Tela de lino*. PORT. *Panno de linho*. RUS. *Polotno*. POL. *Plotno*. LAT. *Linteum*.) Linen-cloth is chiefly made of *hemp* and *flax*. After the filaments of these plants have been properly dressed and combed, they are spun into yarn by the hand, in the usual manner; the yarn is then conveyed to the loom, where it is woven into cloth, after which it is bleached.

Linen is a commodity of universal use, and a commodity that cannot be supplanted by any thing else near so commodious and agreeable for those uses to which it is applied. The species of goods, which come under the denomination of linen, are table-cloths, plain, and damasked, cambric, lawn, shirting, sheeting, towels, Silesias, Osna-burghs, &c. The chief countries in which linens are manufactured, are Russia, Germany, Switzerland, Flanders, Holland, Scotland, and Ireland. Of these, Russia principally manufactures sheeting and sail-cloth; Germany, shirtings, sheeting, and bagging; Switzerland, both fine, and coarse, goods; Flanders, the finer articles, especially cambric and lawn; Holland, sheeting of the very best description; Scotland, coarse shirting; and Ireland, shirting, damask table-linen, and towelling, all of which, in point of quality, are greatly superior to the same description of articles manufactured in any other part of the world. The linen manufactures of Ireland are almost entirely confined to the northern provinces of that kingdom, and immense quantities are annually exported thence to England, and several other parts of Europe, as well as to North, and South America, the West Indies, and Africa. The flax-seed is, for the greater part, procured from America; but other nations engaged in this lucrative branch of trade, either grow their seed at home, or procure it from the north of Europe. In several parts of Germany, Switzerland, Flanders, and France, linens are frequently embellished with painting; and at London, and the other parts of England, the produce of the Irish linen manufacture is beautifully printed in the manner of calicoes.

Several acts of parliament have been made at various times for the encouragement of the manufactures of British, and Irish, linens, and bounties have been allowed upon their exportation. But the first, from which the establishment of this manufacture may be dated, is the 15 Car. 2. prohibiting its importation from abroad, but under a heavy duty. Linens are protected by divers modern statutes.

Persons affixing on any foreign linens im-

ported, any stamp in imitation of those put upon Scotch or Irish linens, shall forfeit 5*l.* for each piece.

No linens to be stamped until oath be made that they are the manufacture of England, or Ireland; nor shall any bounty be allowed upon the exportation of any such linen, unless marked with the manufacturer's name and place of abode. The 18 Geo. 2. c. 27. makes it felony *sans* clergy to steal any linen, linen-yarn, &c. to the value of 10*s.* from bleach-yards, &c.; which offence is extended to accessories by 51 Geo. 3. c. 41. and the punishment changed to transportation. 4 Geo. 3. c. 37. makes it felony *sans* clergy to *destroy*, or *cut*, these articles.

Persons using false stamps, incur a penalty of 5*l.* for each piece. See BLEACHING, FLAX, and WEAVING. See also IRELAND, HOLLAND, &c. article EUROPE.

LING, *gadus molva*, a species of cod-fish. Vast quantities of this fish are salted for exportation, as well as for home consumption. When it is cut or split for curing, it must measure twenty-six inches, or upwards, from the shoulder to the tail; if less than that it is not reckoned a sizeable fish, and consequently not entitled to the bounty on exportation. Ling is an inhabitant of the northern seas, and forms in many places a considerable article of commerce. Large quantities of this fish come to us from the Shetland and Orkney isles, from Rush in Ireland, and from the northern parts of Scotland.

LINGET, a small mass of metal.

LINSEED, (for the foreign names see FLAX-SEED,) is a small flat seed, of an oblong or oval figure, broad and obtuse, or rounded at one end, and terminating in a point at the other; it is of a bright brown colour, with some faint cast of reddishness in it.

Russia, the countries surrounding the Baltic, and Flanders, are more fertile in linseed than any other parts of the world. France, Prussia, Germany, New Zealand, and Great Britain, and Ireland, likewise produce small quantities. The linseed of New Zealand produces flax which, from some experiments made by M. Labillardiere, an ingenious Frenchman, appears to be much stronger than hemp, common flax, or the filaments of the aloë-tree bark. See FLAX.

LINSEED-OIL. (GER. *Leinöl*. DU. *Lynöli*. DA. *Linnolie*, *Hörrolie*. SW. *Linnolja*. FR. *Huile de lin*. IT. *Olio di lino*. SP. *Acete de linaza*. PORT. *Oleo de linhaça*. RUS. *Linjanoe masslo*. POL. *Oley lniany*. LAT. *Oleum lini*.) This oil is procured by expression from the linseed, on account of a mucilage that resides in the shell; the quantity obtained is comparatively small; and as the cold-drawn oil is not so fit for many purposes as that which is drawn hot, the following method is taken to destroy the mucilage before the application of the press: an iron

vessel, like a sand-bath, capable of containing some bushels, is fixed in a furnace. It is then filled with the seed, and heated by a moderate fire. Care must be taken to stir up its contents frequently, that every part may be equally roasted; at first there arises an abundance of aqueous vapour, which, as the heat is increased, is followed by dense blackish fumes, of a very nauseous odour. The roasting being completed, the paste is subjected to the operation of the mill. The cold-drawn oil has a rich yellow colour, is very unctuous, and unpleasant both to the taste and smell; by exposure to the air and light, it becomes dry. The hot-drawn oil is of a rich yellowish-red or deep wine colour, and is more nauseous than the former. It is of a thicker consistence, and dries without much difficulty in the air, particularly if it has been boiled with a little litharge. It is principally used by paint-makers.

LINSEYWOOLSEY, a coarse cloth made of flax, or hemp, and wool mixed, and much worn by the peasantry of Scotland, Wales, &c. It is principally manufactured in those two countries, and in the northern parts of Europe.

LINCHPINS, small pins of iron, which keep the wheels of carriages on their respective axle-trees; for when the end of the axle-tree is put through the nave, the linchpin is put in, to prevent the wheel from falling off.

LINTEL, is that part of the door-frame that lies across the door-posts over head.

LION-SKINS. (GER. *Löwenhäuten*. DU. *Leeuwenhuiden*. DA. *Lövehuder*. SW. *Lejonhudar*. FR. *Peaux de Lion*. IT. *Pelle di Leone*. SP. *Pieles de Leon*. PORT. *Pelles de Leno*. RUS. *Leuwowaja koshi*. LAT. *Leonis pelles*.) The general colour of the lion's skin is pale-tawny, still paler or more inclining to white beneath. The upper part of the head, the neck, and the shoulders of the animal are coated with long shaggy hair, forming a pendent mane; on the body the hair is short and smooth; and the tail is terminated by a tuft of blackish hair. The lioness is destitute of the mane, and is whiter beneath than the male. The lion is principally an inhabitant of Africa, but is also found, though far less numerous, in the hotter regions of Asia. Lion-skins are chiefly used to caparison military chargers, and are occasionally employed in the formation of knapsacks, more especially on the continent of Europe.

LIQUEURS, a word, like the article for which it stands, introduced from the French, and signifying a dram rendered mild and palatable. The foundation of all liqueurs is composed of white, or colourless brandy, and white sugar-candy, in which compound are infused different fruits, as orange, citron, lemon, raspberry, apricot, &c.; aromatics, as cloves, cinnamon, &c.; or kernels of fruits. They are made in many countries of Europe,

and large quantities of them, in cases constructed to contain six, or eight, different sorts, are imported from Hamburg.

LIQUID-AMBER, a resinous juice, flowing from a large tree, which grows in Virginia, Mexico, and other parts of America. This juice is at first about the consistence of turpentine, but by long keeping it hardens into a resin. It is of a yellow colour inclining to red, of a warm taste, and a fragrant smell, not unlike that of storax heightened with a little ambergris. It was formerly of great use as a perfume, but is at present a stranger to the shops.

LIQUORICE, or **LICORICE**. (GER. *Susholz*. DU. *Zoethout*, *Kalishout*. DA. *Lakrizrod*. SW. *Lakritsrot*. FR. *Règlisse*, *Racine douce*. IT. *Regolizia*, *Logorizia*, *Liquirizia*, *Ugurizia*. SP. *Regaliz*, *Orozuz*, *Palduz*. PORT. *Regaliz*, *Regoliz*, *Alcacuz*. RUS. *Koren solodkowi*. POL. *Lakrycia*, *Slodki korzen*. LAT. *Glycyrrhiza*.) This root grows wild in many parts of France, Italy, Spain, and Germany. It is cultivated in several parts of England, but particularly in Yorkshire, in great abundance, and of much finer quality than the foreign liquorice, being longer, evenner, and more succulent than the roots imported from any part of the world.

The plant which affords liquorice-root seldom exceeds a foot in height; its leaves are of a dark glossy green colour, gummy to the touch, and rounded; the blossoms are red, and produce small pods, which contain the seed. When liquorice-root is bought fresh, it ought to be chosen of a close texture, about the thickness of a man's finger, reddish without, of a golden yellow internally, and of a sweet, grateful flavour. When chosen dry, the preference should be given to that which has nearly the same qualities as the foregoing, and, if it be imported, care should be taken not to purchase the refuse of the different bales or parcels, which is ordinarily black, dirty, and of little value. In Germany, Muscovy, and Persia, they cultivate a species of liquorice, which is equally beautiful in appearance, but inferior in point of quality; of this article, large quantities are sent into France, and to other parts of Europe.

Bayonne and Saragossa in Spain, however, supply the principal part of Europe with liquorice-root. It is principally used in medicine, when reduced to powder, in coughs, and disorders of the lungs. It is an ingredient in almost all decoctions and ptisans.

LIQUORICE-JUICE, **SPANISH-JUICE**, or **LIQUORICE-BALL**, (GER. *Lakritzensaft*, *Spanischer saft*. DU. *Drop*. DA. *Lakrisaft*. SW. *Lakrits*. FR. *Suc ou Jus de réglisse*, *Règlisse noir*. IT. *Sugo di regolizia*. SP. *Regaliz en bollos o pastillas*. PORT. *Succo de alcacuz*. RUS. *Solodkowi sod*. POL. *Lakrycia*. LAT. *Succus liquoritiae*.) the inspissated juice of the common liquorice-root, is brought to us in rolls, or cakes, usually

covered with bay-leaves, from Spain and Holland. It is to be chosen firm, but not tough, hard, and when broken, of a fine shining surface, such as perfectly melts in the mouth, and does not taste of burning, nor leaves any harsh or gritty particles between the teeth.

The manner of preparing liquorice-juice in Spain is as follows: they take up the roots in the month of July; clean them perfectly as soon as taken out of the earth, and then hang them up in the air, till nearly dry; after this they cut them into thin slices, and boil them in water till the decoction is extremely strong, when they press it hard out to obtain all the juice from the roots. This decoction is left to settle a little, and when it has deposited its coarsest parts, they pour it off into vessels, evaporate it over a fire, strong first, but mild afterwards, till it becomes of a thick consistence; they then let the fire go out, and when the extract is so cool that they can handle it, they take out large parcels of it at a time, and work them well with the hands, forming them into cylindric masses, which they cut into such lengths as they please, roll them over half-dried bay-leaves, which adhere to their surfaces, and leave them exposed to the sun till perfectly dried. Great nicety is to be observed, at the end of the evaporation, to get the extract to a proper consistence without letting it burn. *Refined liquorice*, or that description of the article which is vended in thin, rounded, and glazed pieces, about the thickness of a crow's-quill, is entirely prepared in this country. The whole process consists in evaporating the liquorice-ball anew, and purifying it by rest, with the help of isinglass, &c.

LISBON WINE, a white-wine, of a fine sweet flavour, which we usually import from the city of that name. See **WINE**.

LIST, in the cloth manufactory, the border of the stuff, bounding its width on each side.

LITERARY PROPERTY. The statute 8 Ann. c. 19. makes it necessary for the printer of a book, published for the first time after the composition, with the consent of the proprietor of the copy-right, to deliver a copy upon the best paper to the warehouse-keeper of the company of stationers for the university library at Cambridge, *notwithstanding the title to the copy of such book, and the consent of the proprietor to the publication, be not entered in the register book of the said company.* 16 East R. 317.

An action is maintainable on the statute 8 Anne, for printing a single sheet of music. *Clementi v. Goulding.* 11 East R. 244.

An action lies to recover damages, "for printing the new corrections and additions to an old work." *Cary v. Longman,* 1 East R. 358.

But no such action lies for publishing sea-charts, on an improved and more useful

principle, with material corrections, though many of the lines were copied from old charts. *Sayre v. Moore. Id.* 361.

But the action lies for a servile imitation of parts of a book of chronology, though other parts of the book were different. *Trusler v. Murray. Id.* 363.

Two penalties may be incurred on the same day on 12 G. 2. c. 36. for selling books, the originals of which have been written and published *here*, and afterwards reprinted in another country, and imported into this, if the acts of sale be distinct. *Brooke v. Millikin.* 5 T. R. 509.

The assignee of a print may maintain an action on statute 17 Geo. 5. c. 57. against any person who pirates it; and it is not necessary in such an action to produce the plate itself in evidence, but one of the prints taken from the original plate is good evidence; but the date must appear on the print. 5 T. R. 41. See further titles **BOOKS** and **ENGRAVING**.

LITHARGE, (GER. *Glütze, Glätte*. DU. *Gelit*. DA. *Glöd*. SW. *Glitt, Glette*. FR. *Litharge*. IT. *Litargiro*. SR. *Almartaga, Litarjirio*. PORT. *Almartaga, Lithargirio*. RUS. *Glet*. POL. *Gleyte, Glete*. LAT. *Lythargyrium*.) an oxide of lead in an imperfect state of vitrification. When silver is refined by cupellation with lead, this latter metal, which is scorified, and causes the scorification of the imperfect metals alloyed with the silver, is transformed into a matter composed of small semitransparent, shining plates, resembling mica; which is litharge. Litharge is more or less white or red, according to the metals with which the silver was alloyed. The white is called litharge of silver, and the red has been, improperly, called litharge of gold.

Litharge may be easily revived into lead; accordingly, much of that which is produced by refining in the large way, is reduced, by being melted upon burning coals. The part of it which is least altered by mixture with other metals is thus reduced, and by this method good and saleable lead is obtained. The rest of the litharge of these refineries is sold, and used, for various purposes. Potters use much of it for glazing their wares. It is employed for the preparation of some plasters, and other external remedies; and also in painting, to render linseed-oil drying. Lastly, it is added in the composition of some glasses, for it is very fusible, and assists the fusion of other substances. It has in general the same properties as the other oxides of lead. All the litharge which is commonly sold comes from refineries. The quantity formed there is more than sufficient for the demand. It comes to us from Sweden, Germany, and Denmark; but that from Dantzic is most esteemed. What we have been treating of is factitious litharge; but there is likewise a natural litharge, a mineral which is very

frequently met with in lead-mines. Natural litharge is usually reddish, is found in scales, may easily be broken, and possesses not only the appearance, but the properties of white lead.

LITHINA, an alkali lately discovered by M. Arfveason, a Swedish chemist, in the mineral called *petalite*. It has been reduced to the metallic state by Sir H. Davy, in which it bears a strong resemblance to sodium. The principal property distinguishing this alkali from potash and soda, is its greater power of saturating acids.

LITHOCOLLA, or LITHOCOLLUM, a kind of cement used by lapidaries to fasten precious stones, in order to cut them. It consists of resin and brick-dust. For diamonds they use melted lead, putting them therein before it is quite cold. For other cements they use marble-dust, with strong glue, and, to fasten their sparks, they add the white of an egg and pitch.

LITHOGRAPHY, the art of printing from stone. It was first introduced into this country, sixteen years ago, by a person of the name of André, who obtained a patent for the invention, but which, of course, could not have been sustained, as the art had been long practised on the continent. A periodical work was published by him, of impressions from stone; but it did not meet with success, and he soon left England. This mode of executing impressions was afterwards adopted by some other persons, but it was for some years very little encouraged; it does not appear that it had yet been practised in perfection in this country. A press has, however, lately been set up by Messrs. Moser and Harris; and as Mr. M. was for some time employed at several of the most considerable lithographic establishments on the continent, we may expect to see this cheap and quick mode of making impressions, (which for many purposes will rival copper-plate engraving,) brought to the highest degree of perfection, and meet with the encouragement it appears to merit. At Munich, where this art is principally practised, all the proclamations, &c. relating to the state, are thus printed; but it is not typographical printing, but copper-plate engraving, that it is, in many instances, likely to supersede.

Any calcareous stone, which is compact, with a fine and equal grain, susceptible of being polished with pumice, and capable of absorbing a little moisture, may be employed for lithography. The stone which completely answers the purpose, is a compact, nearly pure carbonate of lime, of a greyish-white colour. At Solenhofen, near Pappenheim in Bavaria, are extensive quarries of it; also at Kehlheim, near Ratisbon. It is also found in many of the departments of France. Among others, there are strata of calcareous stone in the mountains which separate Ruffec from Angoulême, which

are well adapted for it. It is supposed to be the same as the *white lias*, which is found in England, covering the blue or common lias limestone. But specimens of the requisite hardness and fineness of grain have, we believe, not hitherto been found in this country. The stones are brought to an even surface, by rubbing them against one another, and then finished with fine sand and pumice-stone.

An ink is first to be prepared, with one part, by weight, of white soap, and the same quantity of pure gum-mastic. These substances are melted and carefully mixed together; five parts by weight of shell lac are then incorporated with them, by stirring them together until the whole is completely united, and there is gradually added a solution of one part of caustic soda in five or six parts its bulk of water. This addition must be made cautiously; for if the alkaline ley be poured in all at once, the liquor will froth up, and rise above the sides of the vessel. When these are completely mixed together, by employing a moderate heat, and agitation with a spatula, a proper quantity of lamp-black to give it a dark colour is added, and immediately after as much water as is sufficient to render the ink fluid and in a proper state for writing.

With this ink the design is traced on the stone as it would be on paper, either by a pen, or a camel's-hair pencil. Instead of ink, a pencil is sometimes employed to draw upon the stone, or upon paper, from which a counter-impression is taken upon the stone. The pencils for this purpose are composed of, three parts of soap, two parts of tallow, and one of wax: these are melted together, and well mixed, and lamp-black then added to colour it; the fluid is then run into moulds, where it becomes solid as it cools. The design being drawn on the stone, either with the fluid ink or the crayon, and suffered to dry; water acidulated with nitric acid is employed, in the proportion of 50 parts of water to one of acid: by means of a sponge the surface of the stone is soaked with this water, taking care not to rub the ink-lines. This process is repeated as soon as the stone appears to be dry. An effervescence is produced, and when it ceases, the stone is gently washed with pure water. While the stone is still moist, printers' ink is applied to it, with the common apparatus, which only adheres to the parts which have been drawn on; a sheet of paper not so damp as is required in copper-plate printing is laid over it, and it is subjected to the action of the cylinder-press. It is necessary to take about a dozen proofs before the work comes to its full perfection. After a number of impressions have been taken, the more delicate parts will begin to be a little blurred. As soon as this is perceived, the stone is to be removed from the press, and a sponge filled with rectified oil of turpene-

tine passed over it, and it is then to be washed with pure water. By this treatment the whole design will be apparently discharged: this, however, is not the case; for on applying the printing ink over the stone, every line which was in the original drawing, will again become visible, and the printing may be proceeded with as at first.

A variety in the practice of this art, that may be employed when very fine lines are wanted, is to cover the surface of the stone with a varnish of gum-water and lamp-black; the design may be sketched with an etching-needle, in the same way as on copper. The prepared ink is then to be applied over the whole surface, and when it has become perfectly dry, the stone is to be placed on its edge in warm water; the varnish soon dissolves off, and the traces made with the ink alone remain. The printing from it is then to be executed in the manner above directed.

The effect of wood engraving is given very perfectly by covering the entire surface of the stone with the prepared ink, and then scratching it off in the parts intended to be white.

Nothing resembling the strength or effect of the fine productions of copper-plate engraving can be produced; but it is admirably adapted to represent subjects of natural history, outlines, designs, plans, &c. The art is also applicable to the multiplication of writings, as the subject required to be printed, may be written on paper prepared for that purpose, and transferred on the stone, and printed without the least delay, and at no other expense than the mere printing.

LITMUS. See **LACMUS**.

LIVERY-LACE, a sort of lace for trimming the clothes of servants, usually made of worsted, silk, or gold and silver threads, worked in a variety of patterns. The texture of these laces is perfectly close.

LIVERYMEN of London, are a number of men selected from among the freemen of each company. Out of this body, the common-council, sheriff, and other superior officers of the government of the city are elected, and they alone have the privilege of giving their votes for members of parliament; from which the rest of the citizens are excluded.

LIVES, *Insurance on.* See **INSURANCE**.

LIVRE, an imaginary French money, equivalent to 10*d.* British.

LIXIVIUM, a ley, or water impregnated with the salts of burnt vegetables. What is left, after the evaporation of such a liquor, is called a *lixivious salt*. Lixiviums are used in medicine, bleaching, sugar-works, &c.

LOAD, or **LODE**, in mining, a word used, especially in the tin-mines, for any regular vein or course, whether metallic or not; but most commonly a load means a

metallic vein. It is to be observed, that mines in general are veins within the earth, whose sides receding from or approaching to each other, make them of unequal breadths in different places, sometimes forming large spaces, which are called holes; these holes are filled like the rest with substances, which, whether metallic, or of any other nature, are called loads. When the substances forming these loads are reducible to metal, the loads are by the English miners said to be alive, otherwise they are termed dead loads.

The load is frequently intercepted by the crossing of a vein of earth or stone, or some other metalline substance; in which case it generally happens, that one part of the load is moved to a considerable distance on one side. This load is by the miners termed a *flooding*, and the part of the load which is moved, is by them said to be *heaved*. This fracture or heave of a load, according to Mr. Price, is produced by a subsidence of the strata from their primary positions, which he supposes to have been horizontal or parallel to the surface of the earth, and therefore should more properly be called a depression than a heave. This heaving of the load would be an inexpressible loss to the miner, did not experience teach him that as the loads always run on the sides of the hills, so the part heaved is always moved towards the descent of the hill; so that the miner, working toward the ascent of the hill, and meeting a *flooding*, considers himself as working in the heaved part; wherefore, cutting through the *flooding*, he works upon its back up the ascent of the hill, till he recovers the load, and *vice versa*.

LOADMANAGE, is the hire, which the pilot of a ship receives of the master or captain, for conducting the ship up the river or into port. *Petty loadmanage* and *primage* are due to the master and mariners for the use of his cables and ropes to discharge the goods, and to the mariners for loading and unloading of the ship or vessel: it is commonly about 12*d.* per ton. 32 Hen. 8. c. 14.

If the ropes break in hoisting of goods out of the ship into the lighter or boat, the master must answer if the goods be damaged or lost. *Leg. Oleron*, c. 10. But, if the ropes break at the crane, in taking them out of the lighter, (although till they are landed, they are not out of the master's custody,) yet the wharfinger shall answer.

LOADSMAN, or **LODESMAN**, a kind of pilot, established for the safe-conduct of ships and vessels in and out of harbours, or up and down navigable rivers. See **PILOT**.

LOADSTONE. (GER. *Sw.* and *Pol.* *Magnet.* DU. and DA. *Magneet.* FR. *Aimant.* IT. *Calamita.* SP. *Iman.* PORT. *Iman.* PEDRA DE CEVAR. RUS. *Magnit.* LAT. *Magnes.*) M. Haüy observes, that the ores in which the iron contains the least oxygen

without being engaged in other combinations, form natural magnets: and he calls the *loadstones* of commerce, which are found in considerable masses in Germany, Sweden, Norway, Spain, Italy, China, Siam, the Philippine Isles, Corsica, and Ethiopia, *oxidulated iron*. The loadstone is characterised by the following properties: a very strong action on the magnetic needle. Specific gravity 4.2457. Not ductile. Of a dark grey colour, with a metallic lustre. Primitive form, the regular octahedron. Insoluble in nitric acid. This singular substance was known to the ancients; and they had remarked its peculiar property of attracting iron, though it does not appear that they were acquainted with the wonderful property which it also has, of turning to the pole when suspended, and left at liberty to move freely. Upon this remarkable circumstance the mariner's compass depends, an instrument which gives us such infinite advantages over the ancients. It is this which enables the mariners to conduct their vessels through vast oceans out of the sight of land, in any given direction; and this directive property also guides the miners in their subterranean excavations, and the traveller through deserts otherwise impassable. The natural loadstone has also the quality of communicating its properties to iron and steel; and when pieces of steel properly prepared are touched, as it is called, by the loadstone, they are denominated artificial magnets.

Fire corrodes the loadstone, and humidity diminishes its virtue. A good loadstone ought to be solid, tolerably light, somewhat porous, and of a shining black or deep blue colour.

LOANS, in political economy, sums of money, generally of large amount, borrowed from individuals or public bodies for the service of the state. They are either compulsory, in which case they may be more properly termed requisitions; or voluntary, which is the only mode that can be frequently resorted to with advantage. Loans are sometimes furnished by public companies as a consideration for peculiar privileges secured to them; but are much more commonly advanced by individuals on a certain interest being allowed for the use of the money, either for a term of years, or until the principal shall be repaid.

The practice of borrowing money, for defraying part of the extraordinary expenses in time of war, had been adopted in other countries long before it was introduced into Great Britain; but it has been carried to a far greater extent here, than in any other state; and the facility with which the government has been enabled to raise the largest sums, has arisen entirely from the strict punctuality with which it has constantly made good all pecuniary engagements. The chancellor of the exchequer

is the officer who usually conducts negotiations of this kind on the part of the government, and the agreement is afterwards confirmed by parliament; the governor and company of the Bank of England have, of late years, been usually appointed receivers of the contributions, for which they have an allowance, at a certain rate per million; and the sums received by them are paid into the exchequer, in the name of the chief cashier of the Bank. The money appropriated to pay the interest or annuities, is issued at the receipt of the exchequer to the chief cashier of the Bank upon account, and he is enjoined to pay the annuities, and render his account in due course. The Bank detain their allowance for receiving the contributions out of the sum received, and likewise what they have allowed as discount to those subscribers who advanced their money before the times fixed for the several instalments.

When the parliament has voted the supplies, and the extent of the loan found necessary is determined, a communication is usually made to the Bank or Stock-exchange stating the particular stock on which the loan is to be made, and fixing a day for those who intend to bid for it to wait on the minister with their proposals: in the mean time each person forms his list of friends who are to take different proportions with him in case he succeeds. When the day comes, each party offers as low as he thinks he can venture with a fair prospect of profit, and the lowest offer is generally accepted. The only step to be taken by those who are not of the number just mentioned, and who may wish to take a share in the transaction, is to apply to one of the subscribers for a part of his subscription, which at first may sometimes be had without any premium, or for a very small one, for it cannot be presumed that any small number of men, who have subscribed for the whole sum to be raised, intend, or can keep it, but that they propose to include in their subscriptions a great number of their connections and acquaintance. Sometimes the subscription lies open to the public at the Bank, as in the instance of the loan of eighteen millions for the service of the year 1797, and then every person is at liberty to subscribe what he thinks proper; and if upon casting up the whole, there is a surplus subscribed, which has generally been the case, the sum each person has subscribed is reduced in an equal proportion, so as to make in the whole the sum fixed by parliament.

As soon as conveniently may be, after the subscription is closed, receipts are made out, and delivered to the subscribers, for the several sums by them subscribed; and for the convenience of sale, every subscriber of a considerable sum has sundry receipts for different proportions of his whole sum,

by which means he can readily part with what sum he thinks proper; and a form of assignment is drawn upon the back of the receipt, which being signed and witnessed, transfers the property to any purchaser. The deposit is generally ten per cent., and is made at, or about, the time of subscribing; the second payment is about a month after, and so on till the whole is paid in, each instalment being usually either ten, or fifteen, per cent. Those subscribers who choose to pay the whole sum before the appointed days of payment, are allowed discount at an agreed rate per cent. on the sum paid in advance, from the time of such payment to the period when the whole is required to be paid in by instalments. Those who do not complete the payment of the sum they have subscribed for, forfeit the part they have paid; and this is the case according to the acts of parliament, if the money is not paid by the days appointed; but payments are sometimes received after the appointed days, on paying certain fees to the clerk.

Loans are usually raised upon either redeemable, or irredeemable, annuities. The former are those which, according to the conditions of the acts by which they are created, government may redeem without the consent of the proprietors, by discharging the debt at par; the latter are such as being granted for specific terms, cannot be redeemed without the consent of the proprietors. The various debts that have been incurred at different periods by loans on either of these species of annuities, constitute the funded debt of the nation; that is, the debt which has been secured upon certain funds, created by parliament, and appropriated to the payment of the annual interest on the sums borrowed. The constant hope of being able at a future period to redeem the debts contracted, has induced the government generally to prefer raising money on annuities redeemable at par; and the disadvantage which might arise to the stock-holder from being paid off at par, if his principal bore a high rate of interest, has always made those who advance money on loans prefer a large capital bearing a low rate per cent. though it may actually produce a somewhat less annual interest than would have been given on a capital equal to the sum advanced: the great speculations which are carried on in the public funds are also a strong inducement to prefer advancing money on these conditions, which have contributed so much to increase the nominal magnitude of the national debt.

The economy or extravagance of every transaction of this kind depends on its correspondence or disagreement with the price of the public funds, and the current rate of interest at which money could be obtained on good security at the time the bargain was concluded; and consequently, a loan on which

the highest interest is paid, may have been obtained on the best terms that could possibly be made at the time it was negotiated. The interest paid, however, forms the real burthen of each loan to the country, and is the circumstance to be chiefly attended to in all comparisons of the advantage, or disadvantage, of the terms on which the public debts have been contracted at different periods.

From the difference in the terms of the loan, with respect to the capital created, the rate of interest it bears, and the different periods of the terminable annuities which have been granted with most of the loans, it is evident, that in order to form a proper comparison of the rate of interest paid for the money borrowed at different periods, the various conditions must be brought into some degree of uniformity; and the most obvious mode of doing this is, by converting that part of the interest which consists of terminable annuities into equivalent perpetual annuities; that is, into the additional interest, which must have been paid in lieu of such terminable annuities.

The rate of interest at which such conversion is made affects the result in some instances very materially; thus, the perpetual annuity, which is equal to an annuity of 10*l.* for 21 years, is, at 3 per cent. 4*l.* 12*s.* 5*d.* but at 5 per cent. 6*l.* 8*s.* 2*d.*; and the perpetual annuity equal to an annuity of 10*l.* for 60 years, which at 3 per cent. is 8*l.* 6*s.* is at 5 per cent. 9*l.* 9*s.* 5*d.* from which it is evident, that, if the terminable annuities, granted at different periods, are all valued at the same rate of interest, the comparison will by no means be just; for if a high rate is adopted, the loans which have been obtained at the lowest interest will be set in an unfavourable view; and if, on the contrary, they are all valued at a low rate, the charge of those loans, for which the highest interest is paid, will appear less than it really is. Nor is a medium or average rate more proper for exhibiting the real difference in the terms on which the several loans have been obtained. The least objectionable mode appears to be to convert the terminable annuities into perpetual annuities, according to the current rate of interest at the time when the annuities were granted, as it is upon the rate of interest that the proportionate value of an annuity for a certain term to the perpetuity depends; and in forming the following statements, the conversion has been made at the interest produced by money invested in the three per cents. according to the price of this stock at the times when the terms of the respective loans were settled: for, though by this means, the rate is, in each case, rather lower than it would have been had the interest produced by 4 or 5 per cent. stock been adopted, it is most probable, from the nature of the principal loans, that the stock

which must have been given in lieu of a long annuity, would chiefly have been three per cents; and, therefore, the interest equivalent to the long annuity should be found according to the interest produced by this stock. It may also be proper to remark, that, as the terminable annuities have mostly been granted for a long term, and form but a small part of the whole interest, the difference of a quarter or even half per cent. in the rate at which they are valued has in general but little effect on the whole rate per cent. of the loan. Thus, if the long annuity of the loan of 14,500,000*l.*, in 1797, is valued at 6 per cent. (being the interest produced by 3 per cents. at that time) it makes the whole rate per cent. 6*l.* 6*s.* 10*d.*; but if the long annuity is valued at $5\frac{3}{4}$ per cent. it will be 6*l.* 6*s.* 9 $\frac{3}{4}$ *d.*; at $5\frac{1}{2}$ per cent. 6*l.* 6*s.* 9 $\frac{1}{4}$ *d.*; and, at 5 per cent. 6*l.* 6*s.* 8 $\frac{1}{2}$ *d.*

Lotteries have generally formed part of the terms of the loan; every subscriber of a certain sum towards the latter being entitled to a certain number of tickets, at a certain price. As the whole profits of the lotteries were thus given up to the subscribers, a part of the money advanced must be considered as equivalent to the sum which government would otherwise have received for the lottery, and is therefore to be deducted from the whole sum advanced on the loan. This profit is variable, but has generally been taken at the average of 2*l.* 10*s.* per ticket: making, on a lottery of 50,000 tickets, 125,000*l.* to be deducted from the sum advanced, in estimating the rate of interest paid thereon.

There are some other circumstances which affect the interest paid: such as the discount allowed for prompt payment, the different periods of the instalments, and the times from which the annuities commence; but as these drawbacks do not, in general, amount to any considerable sum, in comparison with the whole amount of the loan, they do not materially augment the rate of interest; and as they more, or less, affect all the loans, they are of still less importance in a comparative view.

It is unnecessary to enter into a particular investigation of the interest paid for the money borrowed in the infancy of the funding system, as the first loans differed materially from those of subsequent periods, in being raised wholly on terminable annuities, and in having a particular fund assigned for each loan, by the supposed adequateness or insufficiency of which the interest required by the lenders was frequently influenced, as well as by other causes, which have since ceased to exist.

During the reign of queen Anne, loans were chiefly raised on annuities for 99 years, till 1711, when, by the establishment of the South Sea company, a variety of debts were consolidated and made a permanent capital, bearing 6 per cent. interest. About

this period lotteries were also frequently adopted for raising money for the public service, under which form a considerable premium was given, in addition to a high rate of interest. This mode of raising money was followed in 1712, 1713, and 1714. In the latter year, though the interest paid was equal to only 5*l.* 7*s.* 2*d.* per cent. on the sum borrowed, the premium allowed was upwards of 34*l.* per cent.; but as peace was restored, and the legal rate of interest had been reduced to 5 per cent. it seems that a larger premium was allowed, for the sake of appearing to borrow at a moderate rate of interest.

In the reign of George I. the interest on a considerable part of the public debt was reduced to 5 per cent. and the few loans that were raised were comparatively of small amount; that of the year 1720 was obtained at little more than 4 per cent. interest.

About 1730 the current rate of interest was $3\frac{1}{2}$ per cent.; and in 1736, government was enabled to borrow at 3 per cent. per annum. The extraordinary sums necessary for defraying the expenses of the war which began in 1739, were at first obtained from the sinking fund and the salt duties; a payment from the Bank, in 1742, rendered only a small loan necessary in that year, which was obtained at little more than 3 per cent. interest. In the succeeding years the following sums were raised by loans:

Sums borrowed.		Interest.
1743	- £ 1,800,000	£ 3 8 4
1744	- 1,800,000	- 3 6 10
1745	- 2,000,000	- 4 0 7
1746	- 2,500,000	- 5 5 1
1747	- 4,000,000	- 4 8 0
1748	- 6,300,000	- 4 8 0

Loans of the seven years' war.

1756	- 2,000,000	- 3 12 0
1757	- 3,000,000	- 3 14 3
1758	- 5,000,000	- 3 6 5
1759	- 6,600,000	- 3 10 9
1760	- 8,000,000	- 3 13 7
1761	- 12,000,000	- 4 1 11
1762	- 12,000,000	- 4 10 9
1763	- 3,500,000	- 4 4 2

Loans of the American war.

1776	- 2,000,000	- 3 9 8
1777	- 5,000,000	- 4 5 2
1778	- 6,000,000	- 4 18 7
1779	- 7,000,000	- 5 18 10
1780	- 12,000,000	- 5 16 8
1781	- 12,000,000	- 5 11 1
1782	- 13,500,000	- 5 18 1
1783	- 12,000,000	- 4 13 9
1784	- 6,000,000	- 5 6 11

Loans of the war with the French republic.

1793	- 4,500,000	- 4 8 7
1794	- 11,000,000	- 4 10 7
1795	- 18,000,000	- 4 15 8
1796	- 18,000,000	- 4 14 9
1796	- 7,500,000	- 4 12 2

	Sums borrowed.	Interest.
1797	- £18,000,000	- £5 14 1
1797	- 14,500,000	- 6 6 10
1798	- 17,000,000	- 6 4 9
1799	- 3,000,000	- 5 12 5
1799	- 15,500,000	- 5 5 0
1800	- 20,500,000	- 4 14 2
1801	- 23,000,000	- 5 5 0
Loans since the war with the French empire commenced.		
1803	- 12,000,000	- 5 2 0
1804	- 14,000,000	- 5 9 2
1805	- 22,500,000	- 5 3 2
1806	- 20,000,000	- 4 19 7
1807	- 14,200,000	- 4 14 7
1808	- 10,500,000	- 4 14 6
1809	- 14,600,000	- 4 12 10
1810	- 12,000,000	- 4 4 2
1811	- 12,000,000	- 4 13 6
1812	- 32,500,000	- 5 5 7
1813	- 27,000,000	- 5 8 6
1814	- 24,000,000	- 4 12 1
1815	- 36,000,000	- 5 12 4
Being the last contracted.		

LOCK, (*Locks.* GER. *Schlüsser.* DU. *Sloten.* DA. *Laase.* SW. *Lås.* FR. *Serrures.* IT. *Serrature.* SP. *Cerraduras.* CER. *rajos.* PORT. *Fechaduras.* RUS. *Samki.* POL. *Zamki.*) a well-known instrument, reckoned the master-piece in smithery, a great deal of art and delicacy being required in contriving, and varying, the wards, springs, bolts, &c. and adjusting them to the places where they are to be used, and to the various occasions of using them. From the various structure of locks, accommodated to their different intentions, they acquire various names, as stock-locks, spring-locks, pad-locks, &c. Of these the spring-lock is the most considerable, both for its frequency and its structure.

A treatise upon this subject has been published by Mr. Joseph Bramah, who begins with observing, that the principle on which all locks depend, is the application of a lever to an interior bolt, by means of a communication from without; so that, by means of the latter, the lever acts upon the bolt, and moves it in such a manner as to secure the lid or door from being opened by any pull or push from without. The security of locks in general, therefore, depends on the number of impediments we can interpose between the lever (the key) and the bolt which secures the door; and these impediments are well known by the name of wards, the number and intricacy of which alone are supposed to distinguish a good lock from a bad one. If these wards, however, do not in an effectual manner preclude the access of all other instruments besides the proper key, it is still possible for a mechanic of equal skill with the lock-maker to open it without the key, and thus to elude the labour of the other. "As nothing (says Mr. Bramah) can be more opposite in principle to fixed

wards, than a lock which derives its properties from the motion of all its parts, I determined that the construction of such a lock should be the subject of my experiment." In the prosecution of these enquiries, he had the satisfaction to find, that the least perfect of his models fully ascertained the truth and certainty of his principle. The exclusion of wards made it necessary to cut off all communication between the key and the bolt; as the same passage which (in a lock simply constructed) would admit the key, might give admission likewise to other instruments. The office, therefore, which in other locks is performed by the extreme point of the key, is here assigned to a lever, which cannot approach the bolt till every part of the lock has undergone a change of position. The necessity of this change to the purposes of the lock, and the absolute impossibility of effecting it otherwise than with the proper key, are the points to be ascertained.

Of late years spring-locks have generally been sunk into, or set within, the doors of apartments, and when thus disposed, they are termed *mortise-locks*. The great advantage which this mode of placing locks has over the old practice of screwing them on the surface of the doors is, that apartments cannot be so readily forced, and that when once the lock is fastened, it cannot be removed without the aid of the key, or without demolishing the door itself.

The chief constituent parts of a spring-lock are the main-plate, cover-plate, and pin-hole, to the first of which belong the key-hole, top-hook, cross-wards, bolt-toe, or bolt-knob, drawback, spring-tumbler, pin of the tumbler, and staples. With the cover-plate are connected a pin, main-ward, cross-ward, and step-ward, or dap-ward; lastly, the pin-hole corresponds with the hook-ward, main cross-ward, shank, pot, or beard, bow-ward, and bit.

The best locks are manufactured at London, and Sheffield; the inferior sorts at Birmingham, Wolverhampton, and Dudley, and in the vicinities of these towns.

LOCUST, (GER. *Johannisbrod.* SODS. *choten.* DU. *St. Jansbrood.* KAROBEN. DA. *St. Hans brod.* SW. *Johannis bröd.* FR. *Caroube.* CAROUBE. IT. *Carobola.* CARRUBA. GUAINELLA. SP. *Algarroba.* GARROBA. PORT. *Alfarroba.* RUS. *Roshki turezkie i krimskie.* POL. *Stodkie.* STRACZE. CHLEB S. JANA. LAT. *Siliqua dulcis.*) a species of bean, the produce of the carobe-tree, which grows abundantly in the island of Cyprus, and in some other islands of the Mediterranean, as well as in some parts of the East Indies. Locusts, which are likewise denominated Carobes, and St. John's bread, are eagerly bought up in the island of Cyprus by the Turks and the Grecians, who annually employ a vast number of vessels in carrying the article to the city of Alexandria. See CAROBES.

LODESTONE, a name given by Cornish miners to stones likewise called tin-stone. They consist chiefly of stones or sand of different kinds, through which oxide of tin is invisibly disseminated. They are heavy, and of various colours; but blue, grey, black, and brown are the commonest.

LODGING. When a house is let out in separate apartments, they are termed *lodgings*, and the persons occupying them lodgers. They may be let, in the same manner as lands, and other tenements, either by a written, or verbal, agreement; by the year, or for any less specified period.

In case of a yearly tenancy, it is usual to have the contract in writing, in order to provide for the notice necessary to be given for quitting. For a less period than a year, it is not usual to make any other than a verbal contract; because where the tenant is to hold for a term certain, no notice is necessary, the tenancy expiring of course with the term for which the engagement was made. Where no term is mentioned, reasonable notice is necessary on both sides, which is generally regulated by local custom. In general, however, if taken from week to week, a week's notice is considered necessary; if from month to month, a month's notice.

It was formerly a doubt, whether a lodger, by reason of the special property he had in the furniture of his lodgings, could be guilty of felony in taking them away. *Kel. 24. Show. 50. 57. 1 Hawk. c. 35. sec. 10.*

But now by 5 & 4 Will. & Mar. c. 9. it is enacted, that if any person or persons shall take away with intent to steal, embezzle, or purloin, any chattel, bedding, or furniture, which by contract or agreement he or they are to use, or shall be let to him or them to use, in or with such lodging, such taking, embezzling, or purloining shall be adjudged larceny and felony. sec. 5.

An offender, to come within the meaning of this act, must be a lodger at the time the larceny is committed. *Old Bail. Sess. 1785, No. 74.*

And where a whole house is let ready-furnished; and, as it is said, where the party, by agreement, is to make good every thing which is missing or injured in a common lodging; for stealing the goods out of such a lodging-house, or ordinary lodging, no indictment will lie on this statute.

A man and his wife can scarcely both be guilty of the same larceny in robbing their lodgings; and where both are committed, the woman will generally be discharged.

Where lodgings are let to man and wife, the taking is that of the husband only.

The furniture let in ready-furnished lodgings cannot be taken as a distress for the rent; part of the contract being for the occupation of the apartments, and part for the use of the furniture. This has been doubted, but the better opinion seems to be as here stated.

Agreement for letting an unfurnished Apartment.

Memorandum of agreement made this — day of — 1818, between A. B. of —, and C. D. of —, whereby the said A. B. agrees to let, and the said C. D. agrees to take all, (*here insert the particulars of the apartments,*) with their and every of their appurtenances therunto belonging, being part of a house and premises now in the occupation of the said A. B. situate and being No. —, in — street aforesaid; to have and to hold the same, with their appurtenances, and the sole and uninterrupted use and occupation thereof, unto the said C. D. his executors, administrators, and assigns, for the term of —, to commence from — now next ensuing, at the net yearly rent of —*l.* of lawful money of the united kingdom of Great Britain and Ireland, free and clear of and from all and all manner of taxes, rates, and assessments whatsoever, parliamentary, parochial, or otherwise howsoever, payable quarterly, on the — day of —, the — day of —, the — day of —, and the — day of —, thence next ensuing: And the said C. D. doth hereby agree to make punctual payments of the rent hereby reserved, on the days and times the same is made payable: And it is further agreed, that at the expiration of the said term of —, the said C. D. may hold, occupy, and enjoy the said —, from quarter to quarter, (*as the case may be,*) for so long a time as the said A. B. and C. D. may and shall agree; and that each party be at liberty to quit possession, on giving to the other — notice or warning, in writing, for that purpose: And it is also agreed between the said parties, that when the said C. D. shall quit the said premises, he shall leave them in as good condition and repair as they shall be in on his taking possession, reasonable use and wear only excepted. As witness our hands.

Agreement for letting furnished Apartments.

Memorandum of an agreement made this — day of —, in the year —, between A. B. of —, on the one part, and C. D. of —, of the other part; by which the said A. B. agrees to let unto the said C. D. (*here insert the full particulars of the apartment,*) situate in — street, in the parish of — aforesaid, complete; furnished (which furniture is mentioned in a schedule hereunder written) (*the inventory must be stamped with the proper stamp,*) being part of the house belonging to the said A. B. to hold the said premises, for and during the term of —, to commence from — now next ensuing, at and under the yearly rent of —*l.* of lawful money of the united kingdom of Great Britain and Ireland, payable quarterly, by even and equal portions; the first quarterly payment thereof to be made on the — day of — now next ensuing: And

it is agreed, by and between the said parties, that he the said C. D. after the expiration of the said term of —, may hold and enjoy the said premises, with the said furniture, from quarter to quarter, (*as the case may be*,) so long as the said parties shall agree, at the same rent as aforesaid: And it is further agreed, between the said parties, that when the said C. D. shall quit the said premises, he shall and will leave the furniture and other things, mentioned in the schedule or inventory thereof hereunder written, in as good state and condition as the same now are, reasonable wear and use thereof only excepted. As witness our hands.

Witness.

Notice to quit Lodgings.

Sir, or Madam,

I hereby give you notice to quit and deliver up, on or before — next, the rooms or apartments, and other tenements, which you now hold of me in this house (*as the case is*.) Witness my hand this — day of —, in the year —. To — (*the lodger*.)

N. B. This must be delivered by a third person, who ought to keep an examined duplicate copy, signed by the landlord.

LOG, in naval affairs, is a flat piece of wood, shaped somewhat like a flounder, with a piece of lead fastened to its bottom, which makes it swim upright in the water. To this log is fastened a long line, called the log-line; and this is commonly divided into certain spaces, 50 feet in length, by knots, which are pieces of knotted twine inreeved between the strands of the line; which show, by means of a half-minute glass, how many of these spaces or knots are run out in half a minute. They commonly begin to be counted at the distance of about 10 fathoms or 60 feet from the log; so that the log, when it is thrown overboard, may be out of the eddy of the ship's wake, before they begin to count: and for the ready discovery of this point of commencement, there is commonly fastened at it a red rag.

The log being thus prepared, and thrown overboard from the poop, and the line veered out by the help of a reel, as fast as the ship sails from it, will show how far the ship has run in a given time, and consequently her rate of sailing.

Hence it is evident, that as the distance of the knots bears the same proportion to a mile as half a minute does to an hour, whatever number of knots the ship runs in half a minute, the same number of miles she will run in an hour, supposing her to run with the same degree of velocity during that time; and therefore, in order to know her rate of sailing, it is the general way to heave the log every hour; but if the force or direction of the wind varies, and does not continue the same during the whole hour, or if there has been more sail set, or any sail handed in, by which the ship has sailed faster, or slower,

than she did at the time of heaving the log, there must be an allowance made for it accordingly.

Log-board, a table, generally divided into five columns, in the first of which is entered the hour of the day; in the second, the course steered; in the third, the number of knots run off the reel each time of heaving the log; in the fourth, from what point the wind blows; and in the fifth, observations on the weather, variation of the compass, &c.

Log-book, a book ruled in columns like the log-board, into which the account on the log-board is transcribed every day at noon: whence, after it is corrected, &c. it is entered into the journal.

LOGARITHMS are numbers so contrived and adapted to other numbers, that the sums and differences of the former shall correspond to, and show, the products and quotients of the latter.

Or, more generally, logarithms are the numerical exponents of ratios; or a series of numbers in arithmetical progression, answering to another series of numbers in geometrical progression. Thus,

0, 1, 2, 3, 4, 5, Indices, or logarithms.

1, 2, 4, 8, 16, 32, Geometric progression.

Or,

0, 1, 2, 3, 4, 5, Ind. or log.

1, 3, 9, 27, 81, 243, Geo. prog.

Or,

0, 1, 2, 3, 4, 5, Ind. or log.

1, 10, 100, 1000, 10000, 100000, Geo. prog.

Where it is evident that the same indices serve equally for any geometrical series; and consequently there may be an endless variety of systems of logarithms to the same common numbers, by only changing the second term, 2, 3, or 10, &c. of the geometrical series.

It is also apparent, from the nature of these series, that if any two indices be added together, their sum will be the index of that number which is equal to the product of the two terms, in the geometric progression, to which those indices belong.

Thus the indices 2 and 3, being added together, are = 5; and the numbers 4 and 8, or the terms corresponding with those indices, being multiplied together, are = 32, which is the number answering to the index 5.

And, in like manner, if any one index be subtracted from another, the difference will be the index of that number, which is equal to the quotient of the two terms to which those indices belong.

Thus the index 6, minus the index 4, is = 2; and the terms corresponding to those indices are 64 and 16, whose quotient is = 4; which is the number answering to the index 2.

For the same reason, if the logarithms of any number are multiplied by the index of its power, the product will be equal to the logarithm of that power.

Thus, the index or logarithm of 4, in the above series, is 2; and if this number is multiplied by 3, the product will be = 6; which is the logarithm of 64, or the third power of 4.

And, if the logarithm of any number is divided by the index of its root, the quotient will be equal to the logarithm of that root.

Thus, the index or logarithm of 64 is 6; and if this number is divided by 2, the quotient will be = 3; which is the logarithm of 8, or the square root of 64.

The logarithms most convenient for practice are such as are adapted to a geometric series, increasing in a tenfold proportion, as in the last of the above forms; and are those which are to be found, at present, in most of the common tables upon this subject.

The distinguishing mark of this system of logarithms is, that the index, or logarithm, of 1 is 0; that of 10, 1; that of 100, 2; that of 1000, 3, &c. And in decimals, the logarithm of 1 is - 1; that of .01, - 2; that of .001, - 3, &c.

From whence it follows that the logarithm of any number between 1 and 10 must be 0 and some fractional parts, and that of a number between 10 and 100 will be 1 and some fractional parts; and so on for any other number whatever.

And since the integral part of a logarithm is always thus readily found, it is usually called the index, or characteristic; and is commonly omitted in the tables; being left to be supplied by the operator himself, as occasion requires.

Of the Making of Logarithms.—Whatever arithmetical progression we apply to a geometrical one, the terms of it are logarithms only to that series to which we apply them, and answer the end proposed only for those particular numbers; so that, if we had logarithms adapted only to particular geometrical series, they would be but of little use. The great end and design of these numbers is the ease and expedition which they afford in long calculations, by saving the laborious work of multiplication, division, and the extraction of roots: but this end would never be completely answered, unless logarithms could be adapted to the whole system of numbers, 1, 2, 3, 4, &c. And as here lie the chief excellence and merit of the contrivance, so also the difficulty. For the natural system of numbers, 1, 2, 3, 4, &c. being an arithmetical, and not a geometrical series, seems rather fit to be made logarithms of, than to have logarithms applied to it. But this difficulty may be easily removed, by considering,

That though the whole system of natural numbers, 1, 2, 3, 4, &c. is not in geometrical progression, and cannot, by any means, be made to agree with such a series, yet it may be brought so near it, as to be within any assignable degree of approximation which

may be conceived, in general, thus: suppose a fraction, indefinitely small to be represented by x , and a geometrical series arising from 1, in the ratio of 1 to $1 + x$, to be 1, $(1 + x)^1$, $(1 + x)^2$, $(1 + x)^3$, $(1 + x)^4$, &c. Then some of these terms must come indefinitely near to all the natural numbers, 1, 2, 3, 4, &c. because, amongst numbers which arise by extremely small increments, some of them must exceed, or fall short of, any determinate number, by an indefinitely little excess or defect.

If, therefore, in the places of the terms of this series, which approach indefinitely near to any of the natural numbers, we suppose these natural numbers themselves to be substituted, then will the series be in geometrical progression, to an exactness which may be called indefinite; because the approximation of its terms to the natural numbers can never end, but goes on *in infinitum*.

And since this imagined geometric series comprehends, indefinitely near, the whole system of natural numbers, 1, 2, 3, 4, &c. so the indices of its terms comprehend a whole system of logarithms, which are adapted to this system of numbers, and may be extended to any length we please. For though the natural system of numbers make not, by themselves, a complete geometrical series, yet they are conceived as a part of such a series, and their logarithms are the indices of their distances from unity in that series; or, more generally, they are the corresponding terms of an arithmetical series applied to that geometrical one.

But, again, it must be observed, that an indefinitely small fraction cannot be assigned: and, therefore, in the actual construction of logarithms, we must be content with a determinate degree of approximation. Whence, according as we take x , in the series, 1, $(1 + x)^1$, $(1 + x)^2$, $(1 + x)^3$, $(1 + x)^4$, &c. the approximation of its terms to the natural numbers will be in different degrees of exactness: for the less x is, the nearer will be the approximation; but then the more are the number of involutions of $1 + x$, necessary to come with any determinate degree of nearness to the natural number assigned.

Thus then we may conceive the possibility of making logarithms to all the natural numbers, 1, 2, 3, 4, &c. to any determinate degree of exactness; viz. by assigning a very small fraction for x , and actually raising a series in the ratio of 1 to $1 + x$, and taking for the natural numbers such terms of that series as are nearest to them and their indices for the logarithms. But then, to construct logarithms in this manner, to such an extent of numbers, and degree of exactness, as would be necessary to make them of any considerable use, is next to impossible, because of the almost infinite labour and time it would require. This, however, is an in-

introduction for understanding the method of the noble inventor, who undoubtedly first took the hint of making logarithms from the consideration of the indices of a geometrical series; and by means of the principles and known properties of these progressions he first formed his tables and adapted them to the practical purposes intended.

To find the logarithm of any of the natural numbers, 1, 2, 3, 4, &c. according to the method of NAPIER.—1. Take the geometrical series, 1, 10, 100, 1000, 10000, &c. and apply it to the arithmetical series, 1, 2, 3, 4, &c. as logarithms. 2. Find a geometric mean between 1 and 10, 10 and 100, or any other two adjacent terms of the series betwixt which the number proposed lies. 3. Between the mean, thus found, and the nearest extreme, find another geometrical mean, in the same manner; and so on, till you are arrived within the proposed limit of the number whose logarithm is sought. 4. Find as many arithmetical means, in the same order as you found the geometrical ones, and the last of these will be the logarithm answering to the number required.

Examples. Let it be required to find the logarithm of 9.

Here the numbers between which 9 lies are 1 and 10.

First, then, the log. of 10 is 1, and the log. of 1 is 0; therefore, $\frac{1+0}{2} = .5$ is the arithmetical mean, and $\sqrt{1 \times 10} = \sqrt{10} = 3.1622777 =$ geometric mean: whence the logarithm of 3.1622777 is .5.

Secondly, the log. of 10 is 1, and the log. of 3.1622777 is .5; therefore $\frac{1+.5}{2} = .75$ = arithmetical mean, and $\sqrt{10 \times 3.1622777} = 5.6234132 =$ geometric mean, whence the log. of 5.6234132 is .75.

Thirdly, the log. of 10 is 1, and the log. of 5.6234132 is .75; therefore $\frac{1+.75}{2} = .875$ = arithmetical mean, and $\sqrt{10 \times 5.6234132} = 7.4989421 =$ geometric mean: whence the log. of 7.4989421 is .875.

Fourthly, the log. of 10 is 1, and the log. of 7.4989421 is .875; therefore $\frac{1+.875}{2} = .9375$ = arithmetical mean, and $\sqrt{10 \times 7.4989421} = 8.6596431 =$ geometric mean: whence the log. of 8.6596431 is .9375.

Fifthly, the log. of 10 is 1, and the log. of 8.6596431 is .9375; therefore $\frac{1+.9375}{2} = .96875$ = arithmetical mean, and $\sqrt{10 \times 8.6596431} = 9.3057204 =$ geometric mean: whence the log. of 9.3057204 is .96875.

Sixthly, the log. of 8.6596431 is .9375, and the log. of 9.3057204 is .96875; therefore

$$\frac{.9375 + .96875}{2} = .953125 = \text{arith. mean,}$$

$$\text{and } \sqrt{8.6596431 \times 9.3057204} = 8.9768713 = \text{geometric mean: whence the log. of 8.9768713 is .953125.}$$

And, proceeding in this manner, after 25 extractions, the logarithm of 8.9999998 will be found to be .9542425; which may be taken for the logarithm of 9, because it differs from it only by $\frac{1}{50000000}$, and is therefore sufficiently exact for all practical purposes.

And in the same manner the logarithms of almost all the prime numbers were found: a work so incredibly laborious, that the unremitting industry of several years was scarcely sufficient for its accomplishment.

To determine the hyperbolic logarithm (L) of any given number (N). The hyperbolic logarithm of any number is the index of that term of the logarithmic progression, which agrees with the proposed number multiplied by the excess of the common ratio above unity.

Let, therefore, $(1+x)^n$ be that term of the logarithmical progression, $1, (1+x)^1, (1+x)^2, (1+x)^3, (1+x)^4, \&c.$ which is equal to the required number (N.)

Then will $(1+x)^n = N$, and $1+x = N^{\frac{1}{n}}$; and if $1+y$ be put = N, and $m = \frac{1}{n}$, we shall have $1+x = N^{\frac{1}{n}} = (1+y)^m = 1 + my + m \times \frac{m-1}{2} y^2 + m \times \frac{m-1}{2} \times \frac{m-2}{3} y^3, \&c.$

And consequently, $x = my + m \times \frac{m-1}{2} y^2 + m \times \frac{m-2}{2} \times \frac{m-3}{3} y^3, \&c.$ where m being rejected in the factors $m-1, m-2, m-3, \&c.$ being indefinitely small in comparison of 1, 2, 3, &c. the equation will become $x = my - \frac{my^2}{2} + \frac{my^3}{3} - \frac{my^4}{4}, \&c.$

Hence $\frac{x}{m} \cdot (nx = L) = y - \frac{y^2}{2} + \frac{y^3}{3} - \frac{y^4}{4} + \frac{y^5}{5}, \&c. =$ hyperbolic logarithm of N, as was required.

The hyperbolic logarithm (L) of a number being given, to find the number (N) itself which answers to it. Let $(1+x)^n$ be that term of the logarithmic progression, $1, (1+x)^1, (1+x)^2, (1+x)^3, (1+x)^4, \&c.$ which is equal to the required number (N.)

Then, because $(1+x)^n$ is universally =

$$1 + nx + n \times \frac{n-1}{2} x^2 + n \times \frac{n-1}{2} \times \frac{n-2}{3} x^3 + \&c.$$

$$\frac{n-2}{3} x^3, \&c. \text{ we shall have } 1 + nx + n \times \frac{n-1}{2} x^2 + n \times \frac{n-1}{2} \times \frac{n-2}{3} x^3, \&c. = N.$$

But since n , from the nature of the logarithms, is here supposed indefinitely great, it is evident that the numbers connected to it by the sign $-$ may all be rejected, as far as any assigned number of terms.

For as 1, 2, 3, &c. are indefinitely small in comparison to n , the rejecting of those numbers can very little affect the values to which they belong.

If, therefore, 1, 2, 3, &c. be thrown out of the factors $\frac{n-1}{2}, \frac{n-2}{3}, \frac{n-3}{4}, \&c.$

$$\text{we shall have } 1 + nx + \frac{n^2 x^2}{2} + \frac{n^3 x^3}{2.3} + \frac{n^4 x^4}{2.3.4}, \&c. = N.$$

But $nx (= L)$ is the hyperbolic logarithm of $(1+x)^n$, or N , by what has been before specified; and therefore $1 + L + \frac{L^2}{2} + \frac{L^3}{2.3} + \frac{L^4}{2.3.4}, \&c. = N = \text{number required.}$

Of the method of using a Table of Logarithms.—Having explained the method of making a table of the logarithms of numbers greater than unity, the next thing to be done is, to show how the logarithms of fractional quantities may be found. And, in order to this, it may be observed, that as we have hitherto supposed a geometric series to increase from an unit on the right hand, so we may now suppose it to decrease from an unit towards the left; and the indices, in this case, being made negative, will still exhibit the logarithms of the terms to which they belong.

Thus Log. $\div 3 = 2 - 10 + 1 + 2 + 3, \&c.$

Num. $\frac{1}{1000}, \frac{1}{100}, \frac{1}{10}, 1, 10, 100, 1000, \&c.$ Whence $+1$ is the logarithm of 10, and -1 , the logarithm of $\frac{1}{10}$; $+2$ the logarithm of 100, and -2 the logarithm of $\frac{1}{100}$, &c.

And from hence it appears that all numbers, consisting of the same figures, whether they be integral, fractional, or mixed, will have the decimal parts of their logarithms the same.

Thus, the logarithm of 5874 being 3.7689339, the logarithm of $\frac{1}{10}, \frac{1}{100}, \frac{1}{1000}, \&c.$ part of it will be as follows:

Num.	Logarithms.
5874	3.7689339
.5874	2.7689339
.05874	1.7689339
.005874	0.7689339
.0005874	-1.7689339
.00005874	-2.7689339
.000005874	-3.7689339

From this it also appears, that the index, or characteristic, of any logarithm, is always one less than the number of figures which the natural number consists of: and this index is constantly to be placed on the left hand of the decimal part of the logarithm.

When there are integers in the given number, the index is always affirmative; but when there are no integers, the index is negative, and is to be marked by a line drawn before it, like a negative quantity in algebra.

Thus, a number having 1, 2, 3, 4, 5, &c. integral places, the index of its log. is 0, 1, 2, 3, 4, &c. And a fraction having a digit in the place of primes, seconds, thirds, fourths, &c. the index of its logarithm will be $-1, -2, -3, -4, \&c.$

It may also be observed, that though the indices of fractional quantities are negative, yet the decimal parts of their logarithms are always affirmative; and all operations are to be performed by them in the same manner as by negative and affirmative quantities in algebra.

In taking out of a table the logarithm of any number not exceeding 10000, we have the decimal part by inspection; and if to this the proper characteristic be affixed, it will give the complete logarithm required.

But if the number, whose logarithm is required, be above 10000, then find the logarithm of the two nearest numbers to it that can be found in the table, and say, as their difference: the difference of their logarithms :: the difference of the nearest number and that whose logarithm is required: the difference of their logarithms nearly; and this difference being added to, or subtracted from, the nearest logarithm, according as it is greater, or less, than the required one, will give the logarithm required nearly.

Thus let it be required to find the logarithm of 367182.

The decimal part of 3671 is by the table .5647844; and of 3672 is .5649027:

The { 367100 is 5.5647844 }
log. of { 367200 is 5.5649027 }

Their diff. 100 .0001183 diff.

Nearest No. { 367200
Given No. { 367182

18 diff.

Therefore 100 : .0001183 :: 18 : .0000212.

And 5.5649027 - .0000212 = 5.5648815 = logarithm of 367182, nearly.

If the number consists both of integers and fractions, or is entirely fractional, find the decimal part of the logarithm as if all its figures were integral; and this, being prefixed to the proper characteristic, will give the logarithm required.

And if the given number is a proper fraction, subtract the logarithm of the denominator from the logarithm of the numerator, and the remainder will be the logarithm

sought; which, being that of a decimal fraction, must always have a negative index.

And, if it is a mixed number, reduce it to an improper fraction, and find the difference of the logarithms of the numerator and denominator, in the same manner as before.

In finding the number answering to any given logarithm, the index, if affirmative, will always show how many integral places the required number consists of; and, if negative, in what place of decimals the first, or significant figure, stands; so that, if the logarithm can be found in the table, the number answering to it will always be had by inspection.

But, if the logarithm cannot be exactly found in the table, find the next greater, and the next less, and then say, As the difference of these two logarithms: the difference of the numbers answering to them :: the difference of the given logarithm, and the nearest tabular logarithm: a fourth number; which added to, or subtracted from, the natural number answering to the nearest tabular logarithm, according as that number is less or greater than the given one, will give the number required, nearly.

Thus, let it be required to find the natural number answering to the logarithm 5.5648815.

The next less and greater logarithms, in the table, are

5.5647844 } The numbers } 367100
5.5649027 } answering } 367200

Diff. .0001183 100

And 5.5649027 - 5.5648815 = .0000212.

Therefore .0001183 : 100 :: .0000212 : 18 nearly.

Whence 367200 - 18 = 367182 = number required.

The Use and Application of Logarithms.

— It is evident from what has been said of the construction of logarithms, that addition of logarithms must be the same thing as multiplication in common arithmetic; and subtraction in logarithms the same as division; therefore, in multiplication by logarithms, add the logarithms of the multiplier and multiplier together, their sum is the logarithm of the product.

	num.	logarithms.
<i>Example.</i> Multiplicand	8.5	0.9294189
Multiplier	10	1.0000000
Product	85	1.9294189

And in division, subtract the logarithm of the divisor from the logarithm of the dividend, the remainder is the logarithm of the quotient.

	num.	logarithms.
<i>Example.</i> Dividend	9712.8	3.9873444
Divisor	456	2.6589648
Quotient	21.3	1.3283796

To find the Complement of a Logarithm.—Begin at the left hand, and write down what each figure wants of 9, only what the last

significant figure wants of 10; so the complement of the logarithm of 456, viz. 2.6589648, is 7.3410352.

In the Rule of Three. Add the logarithms of the second and third terms together, and from the sum subtract the logarithm of the first, the remainder is the logarithm of the fourth. Or, instead of subtracting a logarithm, add its complement, and the result will be the same.

To raise Powers by Logarithms.—Multiply the logarithm of the number given, by the index of the power required, the product will be the logarithm of the power sought.

Example. Let the cube of 32 be required by logarithms. The logarithm of 32 = 1.5051500, which multiplied by 3, is 4.5154500, the logarithm of 32768, the cube of 32. But in raising powers, viz. squaring, cubing, &c. of any decimal fraction by logarithms, it must be observed, that the first significant figure of the power be put so many places below the place of units, as the index of its logarithm wants of 10, 100, &c. multiplied by the index of the power.

To extract the Roots of Powers by Logarithms.—Divide the logarithm of the number by the index of the power, the quotient is the logarithm of the root sought.

To find Mean Proportionals between any two Numbers.—Subtract the logarithm of the least term from the logarithm of the greatest, and divide the remainder by a number more by one than the number of means desired; then add the quotient to the logarithm of the least term (or subtract it from the logarithm of the greatest) continually, and it will give the logarithms of all the mean proportionals required.

Example. Let three mean proportionals be sought, between 106 and 100.

Log. of 106 = 2.0253059

Log. of 100 = 2.0000000

Divide by 4)0.0253059(0.0063264.75

Log. of the least term 100 added 2.0000000

Log. of 1st mean 101.4673846.2.0063264.75

Log. of 2d mean 102.9563014.2.0126529.5

Log. of 3d mean 104.4670483.2.0139794.25

Log. of the greatest

term - 106. 2.0253059.

LOGWOOD. (*GER.* Blauholtz, *Kampeschholz.* Du. *Kampechehout.* Da. *Blaaholtz,* *Campeschetræ.* Sw. *Campescheträ.* Fr. *Bois de Campeche.* It. *Campeggio,* *Legno tauro.* Sr. *Palo de Campeche.* PORT. *Pão de Campeche.* Rus. *Kampetschkoed erewo.* Pol. *Kampesza.* LAT. *Lignum Campechense.*) This wood is likewise called India, Jamaica, and Campeachy wood, from the places where it grows most plentifully. It is very common in Jamaica, and on the eastern shore of the bay of Campeachy; it is found also at St. Croix, Martinico, and Granada. The tree which produces it, is

called, by Linnæus, *Hæmatoxyllum campechianum*. It grows very high and large in a good soil, generally rising from 16 to 24 feet: the bark is thin, smooth, and of a bright grey, or sometimes yellowish; the trunk is straight and prickly: the leaves somewhat resemble those of the bay-tree in appearance, and also in their aromatic qualities; whence the tree has been called aromatic bay, or Indian bay: its seeds have been improperly called clove-seeds, from their flavour, and in England are known by the name of Jamaica pepper, or all-spice. Logwood is so heavy as to sink in water; hard, compact, of a fine grain, capable of being polished, and scarcely susceptible of decay. Its predominant colour is red, tinged with orange, yellow, and black. Logwood is cut in the spring, when the tree is full of sap, at which time the cutters find it easy, after they have cut the trunk and larger branches into lengths, to chip off the blea, or soft outer wood, and bark; and then they lay up the rest for drying. In our markets, logwood is sold either in large solid pieces, or in chips, and the chipt logwood generally bears the better price, fetching about five pounds per ton more than the other. The chief use of logwood is for dyeing. For this purpose, its juice, as it is commonly called, may be extracted by decoction with water. Alcohol extracts it more readily and copiously than water. The colour of its dyes is a fine red, inclining a little to violet or purple. Its watery decoction, left to itself, becomes in time yellowish, and at length black. Acids turn it yellow: alkalies deepen its colour, and give it a purple or violet hue. Stuffs would take only a slight and fading colour from the decoction of logwood, if they were not previously prepared with alum and tartar. A little alum is added also to the bath. By these means a pretty good violet-blue colour may be obtained from logwood, by mixing verdigris with the bath, and dipping the cloth till it has acquired the proper shade. The great consumption of logwood is for blacks, to which it gives a lustre and velvety cast, and for greys of certain shades. It is also of very extensive use for the different compound colours, which it would be difficult to obtain of equal beauty and variety by means of drugs affording a more permanent dye. Juice of logwood is frequently mixed with that of Brazil, to render colours deeper; their proportion being varied according to the shade desired. Logwood is used for dyeing silk violet. For this the silk must be scoured, alumed, and washed. To dye silk thus, it must be turned in a cold decoction of logwood, till it has acquired the proper colour. Bergman has observed, that a fine violet might be produced from logwood, by impregnating the silk with solution of tin. In fact, we may thus obtain, particularly by mixing logwood and Brazil in different proportions, a great number of

fine shades, more or less inclined to red, from lilac to violet. There is a statute prohibiting the use of it in dyeing woollen goods, of not quite a century old, but it is obsolete in practice.

LONG-BOAT, the largest boat belonging to a ship. It serves to bring goods, provisions, &c. to or from the ship, to land men, weigh the anchor, &c.

LONGITUDE, in navigation, the distance of a ship or place, east or west, from another, reckoned in degrees of the equator.

As the discovery of a method to find the longitude would render voyages safe and expeditious, and also preserve ships and the lives of men, the following rewards have been offered as an encouragement to any person who shall discover a proper method for finding it out:—In the year 1714, the British parliament offered a reward for the discovery of the longitude: the sum of 10,000*l.* if the method determined the longitude to 1° of a great circle, or to 60 geographical miles; of 15,000*l.* if it determined it to 40 miles; and of 20,000*l.* if it determined it to 30 miles: with this proviso, that if any such method extend no further than 30 miles adjoining to the coast, the proposer should have no more than half the rewards. The act also appoints the first lord of the admiralty, the speaker of the house of commons, the first commissioner of trade, the admirals of the red, white, and blue squadrons, the master of the Trinity-house, the president of the royal society, the royal astronomer at Greenwich, the two Savilian professors at Oxford, and the Lucasian and Plumian professors at Cambridge, with several other persons, as commissioners for the longitude at sea. The Lowndian professor at Cambridge was afterwards added. After this act of parliament, several other acts passed in the reigns of George II. and III. for the encouragement of finding the longitude. In 1774, an act passed, repealing all other acts, and offering separate rewards to any person who should discover the longitude, either by the watch keeping true time within certain limits, or by the lunar method, or by other means.—In 1818, (58 Geo. 3. c. 20.) another act was passed, “for more effectually discovering the longitude at sea,” which was afterwards amended by 1 & 2 Geo. 4. c. 2. Under the superintendence of the board instituted by this statute, the Nautical Almanack is published, and the time-keepers used in the navy are regulated.

To find the longitude by a time-keeper. The sun appears to move round the earth from east to west, or to describe 360°, in 24 hours, and therefore he appears to move 15° in an hour. If, therefore, the meridians of two places make an angle of 15° with each other, or if the two places differ 15° in longitude, the sun will come to the eastern meridian one hour before he comes to the western meridian, and therefore when it is twelve

o'clock at the former place, it is only eleven at the latter; and, in general, the difference between the times by the clock at any two places, will be the difference of their longitudes converted into time, at the rate of 15° for an hour, the time at the eastern place being the forwardest. If, therefore, we can tell what o'clock it is at any two places at the same instant of time, we can find the difference of their longitudes, by allowing 15° for every hour that the clocks differ.

Let, therefore, the time-keeper be well regulated, and set to the time at Greenwich, that being the place from which we reckon our longitude; then, if the watch neither gains nor loses, it will always show the time at Greenwich, wherever you may be. Now to find the time by the clock at any other place, take the sun's altitude, and thence find the time; now the time thus found is apparent time, or that found by the sun, which differs from the time shown by the clock by the equation of time. We must, therefore, apply the equation of time to the time found by the sun, and we shall get the time by the clock; and the difference between the time by the clock so found, and the time by the time-keeper, or the time at Greenwich, converted into degrees at the rate of 15° for an hour, gives the longitude of the place from Greenwich. For example: let the time by the time-keeper, when the sun's altitude was taken, be 6h. 19', and let the time deduced from the sun's altitude be 9h. 27', and suppose at that time the equation of time to be 7'', showing how much the sun is that day behind the clock, then the time by the clock is 9h. 34'', the difference between which and 6h. 19', is 3h. 15'; and this converted into degrees, at the rate of 15° for 1 hour, gives $48^{\circ} 45'$, the longitude of the place from Greenwich; and as the time is forwarder than that at Greenwich, the place lies to the east of Greenwich. Thus the longitude could be very easily determined, if you could depend upon the time-keeper. But as a watch will always gain or lose, before the time-keeper is sent out, its gaining or losing every day for some time, a month for instance, is observed; this is called the rate of going of the watch, and from thence the mean rate of going is thus found:

Suppose I examine the rate of a watch for 30 days; on some of those days I find it has gained, and on some it has lost: add together all the quantities it has gained, and suppose they amount to $17''$; add together all the quantities it has lost, and suppose they amount to $13''$; then, upon the whole, it has gained $4''$ in 30 days; and this is called the mean rate for that time; and this divided by 30, gives $0''$, 133 for the mean daily rate of gaining; so that if the watch had gained regularly $0''$, 133 every day, at the end of the 30 days it would have gained just as much as it really did gain, by sometimes

gaining and sometimes losing. Or you may get the mean daily rate thus: Take the difference between what the clock was too fast, or too slow, on the first, and last, days of observation, if it be too fast, or too slow, on each day; but take the sum, if it is too fast on one day, and too slow on the other, and divide by the number of days between the observations, and you get the mean daily rate. Thus, if the watch was too fast on the first day $18''$, and too fast on the last day $32''$, the difference $14''$ divided by 30, gives $0''$, 466 , the mean daily rate of gaining. But if the watch was too fast on the first day $7''$, and too slow on the last day $10''$, the sum $17''$ divided by 30, gives $0''$, 566 , the mean daily rate of losing. After having thus got the mean daily rate of gaining, or losing, and knowing how much the watch was too fast or too slow at first, you can tell, according to that rate of going, how much it is too fast or too slow at any other time. In the first case, for instance, let the watch have been $1' 17''$ too fast at first, and I want to know how much it is too fast 50 days after that time: now it gains $0''$, 133 every day; if this is multiplied by 50, it gives $6''$, 65 for the whole gain in 50 days; therefore, at the end of that time, the watch would be $1'$, $23''$, 65 too fast. This would be the error, if the watch continued to gain at the above rate; and although, from the different temperatures of the air, and the imperfection of the workmanship, this cannot be expected, yet the probable error will by this means be diminished, and it is the best method we have to depend upon. In the watches under trial at the Royal Observatory at Greenwich, of candidates for the rewards, this allowance of a mean rate has been admitted, although not mentioned in the act of parliament.

As the rate of going of a watch is subject to vary from so many circumstances, the observer, whenever he goes ashore, and has sufficient time, should compare his watch for several days with the true time found by the sun, by which he will be able to ascertain its rate of going. And when he comes to a place whose longitude is known, he may then set his watch to Greenwich time; for when the longitude of a place is known, the difference between the time there and at Greenwich is also discovered. For instance, if he go to a place known to be 30° east longitude from Greenwich, his watch should be two hours slower than the time at that place. Find, therefore, the true time at that place, by the sun, and if the watch be two hours slower, it is right; if not, correct it by the difference, and it again gives Greenwich time.

In the year 1726, Mr. John Harrison produced a time-keeper of his own construction, which did not err above one second in a month for ten years together; and in the year 1736, he had a machine tried in a

voyage to and from Lisbon, which was the means of correcting an error of almost a degree and a half in the computation of the ship's reckoning. Since that period, other time-pieces have been made by several other persons, who have been severally remunerated by the board of longitude, by the India company, and by many wealthy men of science, for their skill and labour.

Others have proposed various astronomical methods for finding the longitude. These methods chiefly depend on having an ephemeris, or almanac, suited to the meridian of some place, as Greenwich for instance, to which the Nautical Almanac is adapted, which shall contain, for every day, computations of the times of all remarkable celestial motions and appearances, as adapted to that meridian. So that, if the hour and minute be known, when any of the same phenomena are observed in any other place whose longitude is desired, the difference between this time, and that to which the time of the said phenomenon was calculated and set down in the almanac, will be known, and consequently the difference of longitude also becomes known between that place and Greenwich, allowing at the rate of fifteen degrees to an hour.

Now it is easy to find the time at any place, by means of the altitude or azimuth of the sun, or stars, which time it is necessary to find by such means, both in these astronomical modes of determining the longitude, and in the former by a time-keeper; and it is the difference between that time, so determined, and the time at Greenwich, known either by the time-keeper, or by the astronomical observations of celestial phenomena, which gives the difference of longitude at the rate above mentioned. Now the difficulty in these methods lies in the paucity of proper phenomena, capable of being thus observed; for all slow motions, such as belong to the planet Saturn, for instance, are quite excluded, as affording too small a difference, in a considerable space of time, to be properly observed; and it appears that there are no phenomena in the heavens proper for this purpose, except the eclipses or motions of Jupiter's satellites, and the eclipses or motions of the moon, viz. such as her distance from the sun, or certain fixed stars lying near her path, or her longitude, or place in the zodiac, &c. Now of these methods,

1st. That by the eclipses of the moon is very easy, and sufficiently accurate, if they did but happen often, as every night. For at the moment when the beginning, or middle, or end, of an eclipse is observed by a telescope, there is no more to be done but to determine the time by observing the altitude or azimuth of some known star; which time being compared with that in the tables, set down for the happening of the same phenomenon at Greenwich, gives the difference

in time, and consequently of longitude sought. But as the beginning, or end, of an eclipse of the moon cannot generally be observed nearer than one minute, and sometimes two or three minutes of time, the longitude cannot certainly be determined by this method, from a single observation, nearer than one degree of longitude. However, by two or more observations, as of the beginning and end, &c. a much greater degree of exactness may be attained.

2d. The moon's place in the zodiac is a phenomenon more frequent than her eclipses; but then the observation of it is difficult, and the calculation perplexed and intricate, by reason of two parallaxes; so that it is hardly practicable to any tolerable degree of accuracy.

3d. But the moon's distances from the sun or certain fixed stars, are phenomena to be observed many times in almost every night, and afford a good practical method of determining the longitude of a ship at almost any time; either by computing from thence the moon's true place, to compare with the same in the almanac; or by comparing her observed distance itself with the same as there set down.

From the great improvements made by Newton in the theory of the moon, and more lately by Euler and others on his principles, professor Mayer, of Gottingen, was enabled to calculate lunar tables more correct than any former ones; having so far succeeded as to give the moon's place within one minute of the truth, as has been proved by a comparison of the tables with the observations made at the Greenwich observatory; and the same have been still farther improved, and the whole computed to tenths of a second. These tables when compared with the above-mentioned series of observations, a proper allowance being made for the unavoidable error of observation, seem to give always the moon's longitude in the heavens correctly within 30 seconds of a degree; which greatest error, added to a possible error of one minute in taking the moon's distance from the sun or a star at sea, will at a medium only produce an error of 42 minutes of longitude. To facilitate the use of the tables, a nautical ephemeris was adopted by the commissioners of longitude, and first executed in the year 1767, since which time it has been regularly continued, and now is brought to such perfection, that the calculations relating to the longitude, which could not be performed by the most expert mathematician in less than four hours, may be completed with great ease and accuracy in half an hour.

4th. The phenomena of Jupiter's satellites have commonly been preferred to those of the moon, for finding the longitude; because they are less liable to parallaxes than these are, and besides they afford a very commodious observation whenever the planet

is above the horizon. Their motion is very swift, and must be calculated for every hour.

Now, to find the longitude by these satellites: with a good telescope, observe some of their phenomena, as the conjunction of two of them, or of one of them with Jupiter, &c. and at the same time find the hour and minute, from the altitudes of the stars, or by means of a clock or watch, previously regulated for the place of observation; then, consulting tables of the satellites, observe the time when the same appearance happens in the meridian of the place for which the tables are calculated, and the difference of time, as before, will give the longitude.

The eclipses of the first and second of Jupiter's satellites are the most proper for this purpose; and as they happen almost daily, they afford a ready means of determining the longitude of places at land, having indeed contributed much to the modern improvements in geography. There are inconveniences to which these observations are liable from the motions of the ship; however, considering the great power requisite in a telescope proper for these observations, and the irregularities in this motion, it is to be feared that the complete management of a telescope on shipboard, will always remain among the desiderata in this part of nautical science. And further, since all methods that depend on the phenomena of the heavens, have also this other defect, that they cannot be observed at all times, this renders the perfection of time-keepers of the greater importance.

LONG-PEPPER, is the unripe fruit of a tree brought to us from the East Indies, about an inch or an inch and a half in length, of a cylindrical figure, resembling the catkins of the birch-tree. Its external surface appears covered with numerous minute grains, disposed in a very particular manner. Its internal part is divided into several small cells, each of which contains a roundish seed, outwardly of a blackish hue, inwardly whitish; the whole is of a hot, biting, bitterish taste. Long-pepper should be chosen fresh, entire, weighty, hard to break, sound, and free from dust and other impurities.

LOOF, or **LUFF**, in the sea language, is a term used in various senses; thus the loof of a ship is that part of her aloft which lies just before the chess-tree; hence the guns which lie there are called loof-pieces: "keep your loof," signifies keep the ship near to the wind: "to loof into a harbour," is to sail into it close by the wind: "loof up," is to keep nearer the wind: "to spring the loof," is when a ship that was going large before the wind, is brought close by the wind.

LOOF-TACKLE, is a tackle in a ship which serves to lift goods of small weight into, or out of, her.

LOOKING-GLASS, (*Looking-glasses.*

GER. *Spiegel*. DU. *Spiegels*. DA. *Spejle*. SW. *Speglar*. FR. *Miroirs*. IT. *Specchi*. SP. *Espejos*. PORT. *Espelhos*. RUS. *Serkala*. POL. *Zwierciadla*.) a plain glass speculum or mirror, which being impervious to the light, reflects its rays, and so exhibits the images of objects presented to it.

Looking-glasses are invariably made from plate-glass, (*see GLASS*) and are either convex, concave, or perfectly flat. When of a large size, such for example as are used in the embellishment of splendid apartments, they are denominated mirrors, and to such a degree of perfection have glasses of this description been brought, that single mirrors are commonly sold for many hundred pounds. The French plate-glass was formerly unrivalled, but of late years the London makers have produced plates, which if they do not exceed, are certainly in no wise inferior to the finest specimens of French manufacture. For the mode of polishing and grinding plate-glass, *see POLISHING*. For the process of foliating or silvering mirrors, *see FOLIATING*.

LOOM, a weaver's frame, whereby several distinct threads are woven into one piece. Looms are of various kinds, according to the different sort of materials that are to be woven, such as woollens, silks, linens, cottons, cloths of gold, and other works, as tapestry, ribands, stockings, &c. The weaver's loom-engine, otherwise called the Dutch loom-engine, was brought into use from Holland to London, in or about the year 1676. *See WEAVING*.

LOOM, in the sea language. When a ship appears big, being seen at a distance, they say she looms.

LOOM-GALE, a gentle easy gale of wind, in which a ship can carry her top-sails atrip.

LOOP, in the iron-works, denotes a part of a sow or block of cast-iron, broken or melted off from the rest.

LORINER, **LORIMER**, (from the Latin word *Lorum*, a thong,) a bridle bit-maker. The loriner makes bits, and all the iron-work belonging to a bridle, together with the stirrups. It is an ingenious and laborious branch of the smith's business; and the beauty of the work consists in filing and polishing. There is a distinct company of loriners or bit-makers in the livery of London, whose charter bears the date of 1488.

LOSH-HIDES, the hides of buffaloes. *See BUFF*.

LOT, a certain portion or parcel of goods. This appellation is generally applied to any parcel of goods sold by auction. Thus we say of twenty pipes of Port wine put up at once for sale, that the lot consists of twenty pipes; and so of other articles.

Lot likewise signifies a contribution or duty. *See SCOT*.

LOTTERIES, are declared to be public nuisances, 5 Geo. 1. c. 9.; but for the pub-

lic service of the government, lotteries are frequently established by particular statutes, and managed by special officers and persons appointed.

By stat. 42 Geo. 3. c. 54. lottery-office keepers are to pay 50*l.* for every licence in London, Edinburgh, and Dublin, or within 20 miles of either, and 10*l.* for every licence for every other officer; and licensed persons shall deposit 30 tickets with the receiver-general of the stamp-duties, or licence to be void.

By stat. 22 Geo. 3. c. 47. lottery-office keepers must take out a licence; and offices are to be opened only from eight in the morning to eight in the evening, except the Saturday evening preceding the drawing. The sale of chances and shares of tickets, by persons not being proprietors thereof, is prohibited under penalty of 50*l.*; and by 42 Geo. 3. c. 19. all games or lotteries called *little-goes*, are declared public nuisances, and all persons keeping any office or place for any game or lottery, not authorized by law, shall forfeit 500*l.* and be deemed rogues and vagabonds. The proprietor of a whole ticket may nevertheless insure it for its value only, with any licensed office for the whole time of drawing from the time of insurance, under a *bona fide* agreement without a stamp.

Justices, on information, may authorise persons to break open the doors of places where such offences shall have been committed, to apprehend offenders and others assisting them, and carry them before a justice.

Persons employing others, although not discovered upon the premises, to be deemed rogues and vagabonds.

Persons agreeing to pay any sum, or deliver any goods, &c. upon any event relative to such game or lottery, or publishing any proposal for such lottery, shall forfeit 100*l.*

LOUIS D'OR, a French gold coin first struck under the reign of Louis XIII. in 1640, equal to 24 livres French, or 1*l.* sterling.

LOXODROMICK. The art of oblique sailing by the rhomb, which always makes an equal angle with every meridian; that is, when you sail neither directly under the equator, nor under one and the same meridian, but across them.

LUCERNE-SEED. (GER. and DU. *Luzerne*. DA. and Sw. *Lucerne*. FR. *Lucerne*. IT. *Lucerna*, *Erba spagna*. SP. *Alfalfa*. PORT. *Luzerna*, *Herva medica*. LAT. *Medicago*, *sativa*.) This seed produces a species of grass of very quick growth, which affords excellent fodder for cattle. It is a plant frequently cultivated in the manner of clover. Its leaves, like those of the latter, grow three at a joint; its stalk is erect, and after mowing it immediately springs up again from the stubble. It is made into hay in the same manner as saintfoin. It contributes much to make cows yield abund-

ance of milk. France exports large quantities of the seed of excellent quality.

LUFF, or Loor, in the sea language, is to keep the ship close to the wind.

LUGGER, a sort of vessel usually heavily built, and rigged with a square sail. The French employ luggers as privateers; but there are not many of this description of ships in our service.

LUG-SAIL, in maritime affairs, is a kind of square sail.

LUMBER, in the American trade, means stowage-wood and small timber; as spars, joists, boards, planks, shingles, hoops, staves, anchor-stocks, handspikes, &c.

LUNGWORT, or LUNG-MOSS, (GER. *Lungenmoos*. DU. *Longemos*. DA. *Lungemos*. SW. *Lungmossa*. FR. *Palmonaire de chêne*. IT. *Pulmonaria di quercia*. SP. *Pulmonaria de arbol*. PORT. *Pulmonaria dos Carvalhos*. RUS. *Karastnaja trawa*. POL. *Plucnik*. LAT. *Muscus pulmonarius*.) a plant, of which there are seven species; the most remarkable is the common spotted lungwort, or Jerusalem cowslip. It is a native of woods and shady places in Italy and Germany, but has been cultivated in Britain for medical use. The leaves are of a green colour, spotted with white; and of a mucilaginous taste, without any smell. They are recommended in phthisis, ulcers of the lungs, &c. but their virtues in these diseases are not warranted by experience.

LUNT, a match-cord used to fire great guns with.

LUSTRING, a species of light, shining silk, first manufactured in France, but which was several years past introduced into this country. There is at present very little demand for lustrings. They are chiefly made in Spitalfields, and that neighbourhood; and are either plain or delicately figured.

LUTE, (*Lutes*. GER. *Lauten*. DU. *Luiten*. DA. *Lutter*. SW. *Lutör*. FR. *Luths*. IT. *Liuti*. SP. *Laudes*. PORT. *Aulaudes*. LAT. *Cithara*.) a stringed instrument formerly much in use; anciently containing only five rows of strings, but to which six, or more, were afterwards added. The lute consists of four parts, viz. the table; the body, which has nine or ten sides; the neck, which has as many stops or divisions; and the head, or cross, in which screws for tuning it are inserted. In playing this instrument, the performer strikes the strings with the fingers of the right hand, and regulates the sounds with those of the left hand. The origin of this instrument is not known, though generally believed to be of very early date. Indeed, authors are not agreed as to the country to which we are indebted for its invention. Some give it to Germany, and derive its name from the German word *lauten*, which signifies the same thing, whilst others ascribe it to the Arabians. See further title HARP.

LUTES. In many chemical operations the vessels must be covered with something to preserve them from the violence of the fire, from being broken or melted; and also to close exactly their joinings to each other, in order to retain the substances which they contain, when they are volatile, and reduced to vapour.

LYCOPODIUM. The fine dust of lycopodium, or club-moss, is called by some, on account of its great inflammability, vegetable sulphur. The plant is of the creeping kind, and is common in dry and mountainous places, and in forests of fir-trees. Its leaves are numerous, narrow, acute, often curved at the extremity, terminated with a long white hair, which surround the stalk. It produces a kidney-shaped capsule, which bursts with elasticity when ripe, and throws out a light yellow dust, of which we have just spoken. This dust diffused or strewed in the air takes fire from a candle, and burns off like a flash of lightning. It is used in the London theatres. It strongly resists water, insomuch that if a handkerchief be strewed over with the dust, that liquid may be tied up in it. Some species of lycopodium are good dyes. Wool or silk boiled in a decoction of common club-moss, and then immersed in Brazil, acquires a good and

very fast blue. All acids, however, reddens it; but the colour is again restored by alkalis. By increasing the quantity of Brazil the colour may be brought to a pace.

LYNX SKINS, (GER. *Iuchsfelle*. DU. *Losvellen*. DA. *Losskind*. SW. *Loskinn*. FR. *Peaux de lynx ou de loup cervier*. IT. *Pelli di Lince*. SP. *Pieles de Lince ou de Lobos cervales*. PORT. *Pelles de Lince ò de Lobo cervical*.) are of a grey colour, more, or less, approaching to a black, according to the climate which the animal inhabits. The darkest shade is on the back, and the hue becomes gradually lighter downwards to the belly, which is white, and marked with black spots, as are the other parts of the skin. The hair is longest on the belly, and is, therefore, most frequently employed by furriers in the manufacture of muffs. Lynxes are common in Sweden, Russia, Poland, and upon the Alps; those which inhabit the latter are not very dissimilar to the others, but their fur is less soft and beautiful. These animals are likewise to be met with in most parts of North America. Those of Canada and the neighbouring districts, are of a very deep grey colour; but such as inhabit the vicinity of Hudson's Bay are almost white, on which account their skins are highly valued.

M, The twelfth letter of our alphabet. As a numeral, it stands for *mille* a thousand; and with a dash over it, thus *M̄* for a thousand times a thousand, or 1000,000. *M. M. P.* signify *manu mancipio potestate*; *M. S.* manuscript, and *M. S. S.* manuscripts, in the plural. In the prescriptions of physicians, *M* stands for *manipulus*, a handful; and sometimes for *misce*, or *mixture*.

MACE, (GER. *Macis*, *Muskatenblüthe*. DU. *Foelie*, *Foely*, *Muscaatbloem*. DA. *Muskatblommer*. SW. *Muskottblommer*. FR. *Macis*, *Fleur de muscade*. IT. *Mace*. SP. *Macio*. PORT. *Marcis*, *Flor de noz moscada*. RUS. *Muskatnoi zwet*. POL. *Muskatowy kwiat*. LAT. *Macis*.) one of the exterior coverings of the nutmeg; it is at first of a purplish-red colour, which changes before it arrives to us to an orange-yellow, and by long keeping grows paler and paler. It is a fleshy and fat membranous substance, which divides into filaments, lying under the green, and covering the ligneous shell of the nutmeg. It is taken off with a knife, left to dry in the sun for the space of a day, and is afterwards removed to a less exposed place, where it remains for eight days. It is then moistened with sea-water, and lastly

squeezed close in small bags. Mace is a warm aromatic, like the nutmeg, accompanied with a degree of bitterishness, being of an astringent, drying nature; and like that spice also contains both an essential and expressible oil. From 16 ounces of mace, Neumann obtained with alcohol $4\frac{1}{2}$ ounces of extract, which retained some of the expressible, and the more ponderous part of the essential, oil, the lighter arising towards the end of the experiment, and impregnating the distilled spirit; from the residuum were obtained two ounces and a half of gummy extract, with five drachms of essential oil, which arose during the process, and sunk to the bottom of the distilled water. Water applied first extracted four ounces and a half: the residuum gave with alcohol three ounces of an oily extract, eight ounces and a half remaining undissolved. The watery extract has an unpleasant and somewhat saline taste, which that of nutmegs has nothing of. On expression, mace yields an oil less consistent than that of nutmegs, which is usually sold for it. The genuine is commonly brought from the East Indies, in glass or porcelain vessels. The Banda isles annually produce about 100,000 lbs. of mace.

MACHINE, in general, signifies any thing that serves to augment, or to regulate, moving powers, so as to save either time or force.

Machines are divided into simple, and compound. The simple machines are the balance, lever, pulley, wheel, wedge, and screw; the compound are constituted of several simple ones combined together. The latter are innumerable, as well in their form as their application: as stocking-looms, sawing-mills, throwing-engines, weaving or spinning engines, mills for striking files, cutting watch-wheels, making nails, &c. See titles **ENGINE** and **MILL**.

MACKAREL. (GER. *Makrelen*. DU. *Marreelen*. DA. *Makrel*. SW. *Makrill*. FR. *Maquereaux*. IT. *Macarelli*. SP. *Escombros*, *Sardus*. PORT. *Sardas*, *Escombros*. LAT. *Scombri*.) This beautiful fish is a native of the European and American seas, generally appearing at stated seasons, and swarming in vast shoals, round particular coasts. See **FISHERY**.

MADDER. (GER. *Krapp*, *Rüthe*, *Fürberüthe*. DU. *Mee*, *Meckrap*, *Krap*. DA. *Krap*. SW. *Krapp*. FR. *Garance*. IT. *Robbia*. SP. *Granza*, *Rubia*. PORT. *Grança*, *Ruiva*. RUS. *Mariona*, *Krap*. POL. *Marzana*. LAT. *Rubia tinctorum*.) There are seven species, of which the most remarkable is the *tinctorum*, or dyer's madder, so much used by dyers and calico-printers. This has a perennial root, and annual stalk; the root is composed of many long, thick, succulent fibres, almost as large as a man's little finger; these are joined at the top in a head like asparagus, and run very deep into the ground. From the upper part, or head of the root, come out many side-roots; which extend just under the surface of the ground to a great distance, by which it propagates very fast; for these send up a great number of shoots, which, if carefully taken off in the spring, soon after they are above ground, become so many plants. * The root is of a reddish colour, somewhat transparent; and has a yellowish pith in the middle, which is tough, and of a bitterish taste. From this root arise many large four-cornered jointed stalks, which in good land will grow five or six feet long, and if supported, sometimes seven or eight; they are armed with short herbaceous prickles; and at each joint are placed five or six spear-shaped leaves: their upper surfaces are smooth; the branches are terminated by loose branching spikes of yellow flowers, which are cut into four parts resembling stars. These appear in June, and are sometimes succeeded by seeds, which seldom ripen in England.

For cultivating the madder plant, the ground is ploughed deep in autumn, and again in March; and then laid up in ridges, eighteen inches asunder, and about a foot high. About the beginning of April they open the ground where the old roots are

planted, and take off the side-shoots, which they transplant immediately upon the new ridges, at about a foot distance, where they remain two seasons; at Michaelmas, when the tops of the plants are decayed, they take up the roots. It is to be observed, that this method of planting in ridges, is only necessary in wet land. If all the horizontal roots are destroyed from time to time, it will cause the large, downright roots, to be much bigger, in which the goodness of this plant chiefly consists. After the madder-roots, the only parts of the plant used by dyers, are taken up, they are kiln-dried, and then reduced to a powder by a mill. Previously to the grinding they are carefully assorted; the finest roots peeled make, what is called, crop, from the German *krap*; good roots, not peeled, make the ombro, *unberaubt*; gamene, or *gemeine*, are all the inferior small roots; the mulls consist of the refuse, peelings, &c. The fine quality of madder is distinguished by its being of a bright, lively, light colour, well ground, without any coarse parts, proceeding from the peelings. Fresh is always more valuable than old madder. It should be kept close to prevent the access of air, as its virtue evaporates when exposed. Madder is principally cultivated in Holland, Germany, and France, especially the former, where it grows in greater abundance than in any other part of the world. The *rubia peregrina*, or Turkey madder-root, likewise called *alizari*, is principally cultivated about Smyrna. This plant may be propagated either by offsets or seeds. On a light thin soil the culture cannot be carried on to any profit: that soil in which the plant delights, is a rich sandy loam, three feet or more in depth.

The ground being first made smooth, is divided into beds four feet wide, with alternate alleys, half as broad again as the beds: the reason of this extraordinary breadth of the alleys will appear presently. In each alley is to be a shallow channel for the convenience of irrigating the whole field, &c. that that part of the alley that is not otherwise occupied, may be sown with legumes. The madder-seed is sown broad-cast in the proportion of from 25 to 30 lbs. per acre, about the end of April. In a fortnight or three weeks the young plants begin to appear, and from this time to the month of September, care must be taken to keep the ground well watered and free from weeds. If the plants are examined in autumn, they will be found surrounded with small yellow offsets at the depth of two inches, and early in September, the earth from the alleys is to be dug out and laid over the plants of madder to the height of two or three feet; with this the first year's operation finishes.

The second year's work begins in May, with giving the beds a thorough weeding; and care must be taken to supply them with plenty of water during summer. In Sep-

tember, the first crop of seed will be ripe, at which time the stems of the plants may be mown down, and the roots covered a few inches with earth, taken as before out of the alleys.

The weeding should take place as early as possible in the spring of the third year; and the crop, instead of being left for seeds, may be cut three times during summer for green fodder, all kinds of cattle being remarkably fond of it. In October, the roots are taken up, the offsets are carefully separated, and immediately used to form a new plantation; and the roots, after being dried, are sold either without further preparation, or ground to a coarse powder, and sprinkled with an alkaline ley. The roots lose four-fifths of their weight in drying, and the produce of an acre is about 2000 lbs. weight of dry saleable madder.

It is always imported in its original state, as a root. Our dyers have tried the experiment of ordering the Dutch madder from abroad in the same state, but they were not able to use it. The principal use of madder is in dyeing. It gives out its colour both to water, and rectified spirit: the watery tincture is of a dark, dull red; the spirituous, of a deep bright one. It imparts to woollen cloth, prepared with alum and tartar, a very durable, though not a very beautiful red dye. As it is the cheapest of all red drugs, that give a durable colour, it is the principal one commonly made use of for ordinary stuffs. Sometimes its dye is heightened by the addition of Brazil-wood, and sometimes it is employed in conjunction with the dearer reds, as cochineal, for demi-scarlets, and demi-crimsons. Madder-root is sometimes employed in medicine as an emmenagogue. When the madder is given to animals with their food, it produces a curious phenomenon, namely, tinging their bones with red. The bones of young pigeons will be thus tinged of a rose-colour, in 24 hours, and of a deep scarlet in three days; but the bones of adult animals will be a fortnight in acquiring a rose-colour. See DYEING.

The cultivation of this article was protected by 31 Geo. 2. c. 35., whereby the pulling up, stealing, or destroying the roots thereof, was made an offence punishable summarily on conviction before a justice. The importation of it has been made subject to a duty by different statutes, the last of which is 58 Geo. 3. c. 55.

MADEIRA, a well known white wine, deriving its name from an island of Africa, where the vines which produce it are cultivated. This wine is usually purchased by the English, the Dutch, and the Danes, who sometimes bring it directly from the island of Madeira; but it is frequently sent either to the East or West Indies, in order to its amelioration, and is thence brought to England. The Americans are likewise purchasers of Madeira wines; and no inconsi-

derable shipments of the article are made to the Portuguese settlements in South America. The wine generally known by the name of Madeira, is a dry, full-bodied, white wine; but there are, besides this description of the wine, Burgundy-Madeira, whose colour and flavour are nearly similar to those of the wine from which it derives its designation, and Malmsey-Madeira, a white, luscious, and highly palatable wine.

MAGAZINE, in its primary signification, means a store-house, or granary, but is metaphorically used for any large receptacle for miscellaneous produce; whence, in literature, it is applied to those periodical publications which are the depositories of a great number of short independent essays, and other miscellaneous matter. In the *art military*, the term is applied to a place in fortified towns, set apart for the reception of all kinds of military stores. In the *art naval*, to a small apartment in a ship, where the powder for battle is kept. In mercantile language, the application of the word approaches nearer to its original signification; for it means nothing more than the principal store-house, or receptacle for the articles of trade, from which the places for traffic, or inferior deposit, are supplied.

MAGNESIA, (LAT. *Magnesia alba*,) like all the other earths, is nowhere found in a state of purity. The earth which hitherto appears to present it in a state the nearest approaching to purity, is that of Salinello, near to Sommieres, in the department of Gard, where M. Berard has shown that it is mixed with silex in the proportion of 22 parts pure magnesia, 45 silex, 1 oxide of iron, and 32 water. It exists also, mixed with silex and with alumine, in talcs, in the serpentine earths, in asbestos, and generally in all the unctuous stones which admit of being worked in the lathe. Nature presents it to us in the state of a salt, almost always combined with the sulphuric acid. This combination is formed by the efflorescence or decomposition of certain secondary schists more or less charged with sulphur: in proportion as the sulphuric acid is produced by the slow combustion of the sulphur, it attaches itself to the component parts of the schist, and gives rise to the sulphate of lime, magnesia, alumine, or iron. It is by the decomposition of the sulphate of magnesia, that this earth is usually obtained. Magnesia, when pure, is very white, light, and spongy.

Magnesia is much used as a medicine. It is generally employed in the form of carbonate; but there are many cases in which it is important that it should be used *pure*. Various methods have been adopted for obtaining it entirely free from carbonic acid: the most effectual, is that of Mr. Lockyer, of London. The magnesia prepared by this chemist is in a state of absolute purity.

MAGNET. See LOADSTONE.

MAHOGANY. (GER. *Mahagonholz*.)

Du. Mahognyhout. Da. Mahagoni. Sw. Mahogany. Fr. Bois de mahagoni, d'amaranthe, d'acajou. Ir. Legno mogano. Sr. Caoba, Caobana. Port. Caoba, Pao mahagony.) The *swietenia mahagoni* or mahogany-tree, is a native of the warmest parts of America, and grows also in the islands of Cuba, Jamaica, Hispaniola, and the Bahamas. It abounded formerly in the lowlands of Jamaica; but it is now found only on high hills, and places difficult of access. This tree grows tall and straight, rising often sixty feet from the spur to the branches, and is usually four feet in diameter. The foliage is a beautiful deep green, and the appearance made by the whole tree, so elegant, that none could be more ornamental for an avenue. The flowers are of a reddish or saffron colour, and the fruit of an oval form about the size of a turkey's egg. Some of them have attained to a monstrous size, exceeding one hundred feet in height.

In felling these trees, the most beautiful part is commonly left behind. The negro-workmen raise a scaffolding four or five feet above the ground, and hack up the trunk, which they cut into balks. The part beneath, extending to the root, is not only of a larger diameter, but of a closer texture than the other parts, most elegantly diversified with shades or clouds, or dotted like ermine, with black spots, and moreover takes the highest polish, with singular lustre. This part is only to be come at by digging below the spur, to the depth of two or three feet, and cutting it through, which is so laborious an operation, that few attempt it, unless they are uncommonly curious in the choice of their wood, or to serve a particular order. The mahogany tree thrives in most soils, but varies in texture and grain, according to the nature of the soil. On rocks it is of a smaller size, but very hard and weighty, and of a close grain, beautifully shaded; while the produce of the lower and richer lands is observed to be more light and porous, of a paler colour and open grain; and that of mixed soils to hold a medium between both. This constitutes the difference between the Jamaica wood, and that which is collected from the coast of Cuba, and the Spanish main; the former is mostly found on rocky eminences, the latter in swampy soils near the sea-coast. The superior value of the Jamaica wood for beauty of colour, firmness, and durability, may, therefore, be easily accounted for; but as a large quantity of balks and planks is brought from the Spanish-American boats to Jamaica, to be shipped thence to Great Britain, the dealers are apt to confound all under the name of Jamaica-wood, which in some measure injures the credit of this staple production. This wood is generally hard, takes a fine polish, and is found to answer better than any other sort, in all kinds of cabinet ware. It is a very strong timber,

and was frequently used as such, in Jamaica, in former times. It was not till the commencement of the last century, that mahogany was imported into England, with the view of making household furniture of it.

The Spaniards were the only people who could afford to build their ships of war of mahogany; but they obtained it from the colonies without much difficulty, on account of government. The men of war of that nation, taken by the English, at the last memorable siege of Gibraltar, in 1782, were of the finest species of this wood.

MAIL, or COAT OF MAIL, a piece of defensive armour for the body, made sometimes almost entire, at other times in the shape of scales, like the outward coat of fish, other times of small iron rings, interwoven in the manner of a net.

MAIL-COACH, emphatically denominated "*the mail*," from its being a carriage of the coach kind, expressly appropriated (in its primary application) to the conveyance of letters in leathern bags, formerly called mails. These coach-conveyances for letters were established in 1784; previous to which, the mails or bags were conveyed on horseback, or in small carts.

MAILLE is a term which, at different periods, has been used to signify a small coin. In that sense it is still understood in France, and was common in England in the reign of our Henry 5. In Scotland it had the same signification originally; but afterwards was used as synonymous with small rent, so small as to be paid in mailles, the smallest of coin. Hence they had the term black maille, and white maille, which make a conspicuous figure in the histories of the border-wars.

MAIN-MAST, the chief or middle-mast of a ship. It is divided into four unequal sections, viz. the *main-mast*, properly so called, which first rises from the deck; the *main-top-mast*, immediately rising from the *main-mast*; the *main-top-gallant-mast*, just above the *main-top-mast*; and the *main-royal-mast*, which crowns the whole. The form of the *main-mast*, like that of other masts, is taper. Each division of the mast has its particular sail to which it gives name; as the *main-sail*, *main-top-sail*, &c. and its particular yard, as the *main-yard*, *main-top-sail-yard*, *main-top-gallant-sail-yard*, &c. besides its separate head or top, as the *main-top*, *main-top-mast-head*, &c. The ropes, tackling, &c. of each section are named in a similar manner.

MAIZE, (GER *Maïs*. DU. *Mays*. FR. *Maïs*, *blé d'Inde*. SP. and PORT. *Maiz*. LAT. *Fruimentum indicum*.) a kind of Indian corn, much used in America for making of bread. The stalk of the maize is joined like the sugar-cane; it is very soft and full of juice, which is so sweet that a syrup has been made from it; and things sweetened with it have not been distinguishable from

those done with sugar. The stalk of this plant, if cut up before it is too much dried, makes excellent winter fodder for cattle. The husks about the ear, are usually separated from the rest, and afford a particular sort, not inferior to our hay. To reduce the grain into flour, it is carefully parched in an oven, pounded in mortars, and then sifted. See ZEA.

MALACHITE, green carbonate of copper. This ore is often amorphous, but often crystallised in long slender needles. Its specific gravity is 3.571 to 3.655. It may be easily scratched with a knife. It dissolves with effervescence in the nitric acid, and colours the flame of it green. Malachite is susceptible of the finest polish, and is found in masses or stalagmites; of it are made cups, snuff boxes, trinkets, which look extremely well, as the surface is almost always ornamented with zones of various strongly-marked colours, with succession of the beds or layers that have gradually formed the malachite. It is found in great quantity on the Vosges, mountains so called in Lorraine, and in the mines of the Harts forest in Saxony. The silky green copper ore of this kind from China, where it is found abundantly in the form of solid bundles, is the purest. There is a species of Siberian malachite which is sometimes mixed with calcareous earth and gypsum, and is found in Norway and Siberia.

MALLEABILITY, a property of metals, whereby they are capable of being extended under the hammer. Gold is considered the most malleable of all metals. See GOLD, IRON, COPPER, &c.

MALLET, a wooden hammer.

MALMSEY-WINE. (GER. *Malvasier*. DU. *Malveziewyn*. FR. *Malvasier*. SW. *Malvasirvin*. IT. *Malvasia*. SP. and PORT. *Malvasia*. RUS. *Malvaseja*. POL. *Malwazyja*. LAT. *Vinum malvaticum*.) This designation is generally bestowed upon a luscious, rich species of Madeira wine; several sorts of Spanish sweet wine are, however, likewise denominated malmseys, more especially by French writers. The vine which produces malmsey-wine, properly so called, is a native of Malvasia, a small Grecian island, where its cultivation is at present but little attended to.

MALT, (GER. *Maly*. DU. *Mout*. DA. and SW. *Malt*. FR. *Mal*, *Blégermé*. IT. *Malto*. SP. *Cebada retonada ó entallecida*. RUS. *Solod*. POL. *Slod*. LAT. *Maltum*.) is, correctly, any corn prepared after a particular manner, for brewing the various kinds of beer; but in its general acceptation is applied only to barley so prepared.—Before we proceed to state the method of making malt, it is necessary to premise, that the colour which is designed to be given to liquor made from malt, is occasioned by a greater, or less, degree of heat; the fine pale ales being pro-

duced by malt dried on floors moderately heated, while porter, and the other dark-coloured liquors, are obtained from malt dried on floors excessively heated, which is generally denominated “high dried malt.”

It has been well observed by an able writer on this subject, (Theoretic Hints on Brewing, by Richardson,) that “the process of malting is but an artificial or forced vegetation, in which, the nearer we approach the footsteps of nature in her ordinary progress, the more certainly we shall arrive at perfection.” A bold acrospire, or plumule, therefore, extending to the extremity of the grain without having actually burst its confinement, is the best indication of the perfection of malt. The first consideration involved in this subject, is the barley from which the malt is to be manufactured; and after much discussion, it seems now to be admitted, that the boldest grain, with the fullest skin, is the best, although it be true that the corn of a lighter quality, grown on light sandy land, *malts more freely*, to use a technical phrase. The first step, then, in the operation of manufacturing barley into malt, is

Steeping the barley.—This is performed by placing it in a cistern constructed for the purpose, in which it is to be completely saturated with water, and the softer that water is, the better. The formation of these cisterns, and the number of hours the corn is to continue in steep, as well as the notice to be given of performing this operation, have been the subject of many successive provisions by statute. The most recent are 52 Geo. 3. c. 128, and 55 Geo. 3. c. 9. Maltsters are prohibited by a former stat. (3 Geo. 3. c. 13.) from beginning to wet, or steep, their malt at any time, without first giving 24 hours’ notice to the excise-officer, in cities and market-towns, and 48 hours in other places. By the before-mentioned stat. of 53 Geo. 3. it is enacted, that thenceforward where any maltster shall, in the notice in writing by him given, or caused to be given, to the officer of excise, under whose survey such maltster shall then be, of the particular hour or time of the day, when he or she intends to wet corn or grain to be made into malt, specify, that it is the intention of such maltster to continue the same in steep for the space of sixty-five hours, from the time of its being first begun to be wetted, it shall be lawful for such maltster who shall have wetted such corn, or grain, according to such notice, to continue the same in steep and covered with water, for the said space of sixty-five hours; provided always, that no maltster, having so as aforesaid specified such intention, shall begin to wet or steep any such corn or grain specified in such notice to be intended to be continued in steep for the said space of sixty-five hours, at any other time than between the hours of eight

in the evening and eleven at night; and any such maltster, having so specified such intention, shall be at liberty to begin to wet or steep any such corn or grain, and so to continue in steep for the said space of sixty-five hours, at any time between the hours of eight in the evening and eleven at night, any thing in any former act to the contrary in anywise notwithstanding; and no such maltster shall empty, or take any such corn, or grain from, or out of his, or her cistern, uting, vat, or other vessel, or utensil used for the wetting, or steeping thereof, at any other time than between the hours of one and four in the afternoon; and if any such maltster, having wetted, or begun so to wet, any such corn or grain, shall neglect or refuse to continue the same or any part thereof in steep, or covered with water, for any longer, or shorter, space of time than sixty-five hours, from the time of its being first begun to be wetted, or shall begin to wet or steep any such corn, or grain, at any other time than between the hours of eight in the evening and eleven at night, or shall empty, or take any such corn, or grain from, or out of, his, her, or their cistern, uting, vat, or other vessel, or utensil, and for the wetting, or steeping thereof, at any other time than between the hours of one and four in the afternoon of that day, on which such sixty-five hours shall expire; such maltster so offending, shall for every such offence, forfeit and lose the sum of 200*l.* s. 2.

And whereas, by means of a ladder, and moveable plank, any cistern may be accurately gauged, if one side of such cistern be accessible. Every maltster shall thenceforward provide such ladder, and such moveable plank, of a convenient length and breadth, and shall also so construct his cistern, or cisterns, that the said moveable plank may be laid across every such cistern in every part thereof, in such a manner and form, that any officer of excise may easily and securely have access to such cistern and cisterns respectively, and conveniently gauge in every part thereof the corn or grain which shall at any time be contained therein, on pain of forfeiting 200*l.* for neglect, or refusal, to provide the same.

When the corn has been completely saturated, by lying its due time in the cistern, it is taken out and put into a square frame, where it lies something more than 24 hours, in which state it is called a *couch*. When it has lain in the couch its appointed time, it is turned out, and it is then called a *floor*. Here the principal skill of the maltster, in the manufacture of malt, is required; for, to his management of it in this state, the progress of that inchoate vegetation, on which the quality of the article depends, is indebted. If it be heaped too thick, or remain in a quiescent state too long, an undue heat will be generated, and the malt spoiled. It should

not exceed 45 degrees *Fahrenheit*. After this explanation it is scarce necessary to add, that the floor should be spread thin, and frequently turned, not less, on the whole, than three times in twelve hours. The next step is that of *sprinkling* the malt on the floor with water, which is prohibited by statutes 42 Geo. 3. c. 38. and 48 Geo. 5. c. 74. from being done till the expiration of 12 days after it shall have been taken from the cistern, under a penalty of 200*l.* on the maltster, and 50*l.* or imprisonment of 12 months, on the servant or labourer employed in so doing.

The next process is *drying on the kiln*. In this operation, the grain is spread thick upon a floor composed of flat bricks, constructed specially for the purpose, or of iron plates, full of perforations. Under this floor is an oven, or furnace, in which is a large fire made of coles, or billets of wood, which, by a current of air at the mouth of the furnace, are kept in full conflagration for at least two days. Nothing but coke, or wood, will answer this purpose, as the smoke of coal would spoil the malt. The kiln is a room from 12 to 14 feet in height, and in the centre of the area, and in proportion to its dimensions, is an enclosure for the purpose of retaining the heat of the fire, that the whole may be regularly distributed to every part of the drying floor.

The admission of a certain quantity of atmospheric air, which is accomplished by different devices in different kilns, is necessary, and by the admission of more or less of it, and by the quantity of fuel administered, depends chiefly the colour of the liquor to be extracted from the malt. The depth of the malt on the floor must vary according to various circumstances; as, the draught of the kiln, the saturation of the grain, &c. &c. but the usual thickness may be about four inches; and the time required for drying the palest malt from 60 to 70 hours.

By 42 Geo. 3. c. 58. maltsters are prohibited from wetting, sprinkling, or damping malt after it shall have been taken from the kiln, before delivery to a purchaser under a penalty of 100*l.*

By 55 Geo. 3. c. 128. no maltster shall have more than five floors of malt arising from the same cistern, in his malt-house, at the same time, under a penalty of 200*l.*; and shall not lay his floors of corn, but in succession according to seniority, under a penalty of 100*l.* and shall not empty his cistern more than once in 96 hours, under a penalty of 200*l.*; and every maltster shall empty all his cisterns, if he have more than one, at the same time, under a like penalty of 200*l.* and shall not mix corn of different wettings, either on the floor or kiln, under a penalty of 200*l.*

Malt made specially for exportation is subject to many regulations, which it is beside our purpose to notice in this place; but they are generally provided for annually by the malt act. It may be necessary, how-

ever, to add to what has already been advanced on the general subject, that every maltster must take out an annual licence, (*see title LICENCE*;) that malt made for exportation only is not liable to duties (12 Geo. 1. c. 4. and 33 Geo. 2. c. 7.); nor shall any drawbacks be allowed for malt exported (*Id.*); and lastly, that if any person who shall export malt shall produce a certificate from the officer with whom the entry of the corn shall have been made, (which the latter is to give gratis) of the sums that such person is entitled to receive, according to the allowance of thirty quarters of malt for every twenty quarters of corn entered, and upon such person's giving security to the customer or collector, that the malt shall not be relanded in Great Britain, then the collector or chief officer of the port shall give the exporter a debenture, directed to the person by whom the allowance is to be paid; which debenture being produced, such person is to pay such allowance.

If the malt, or any part thereof, be re-landed, all such malt, and treble the value, shall be forfeited; one moiety to the king, and the other to the person who shall seize, inform, or sue; and the malt may be seized by any officer of customs or excise. The 3 Geo. 4. c. 18. repealed some of the duties on malt, and made regulations for better securing the duties on malt.

MALTHA, or **MINERAL PITCH**, a kind of cement much used in ancient times, of which there were two sorts, native and factitious; one of the latter sort consisted of pitch, wax, plaster, and grease; another kind used by the Romans in their aqueducts, was made of lime slacked in wine, incorporated with melted pitch and fresh figs. Natural maltha is a kind of bitumen, with which the Asiatics plaster their walls; and which being set on fire, its combustion is augmented by the effusion of water.

MAMOUDI, a Persian silver coin, value 8*d.* British.

MANCHINEEL-TREE, a native of the West Indies, which grows to the size of an oak. Its wood is of a beautiful grain, will polish well, and last long. The fruit is of the colour and size of the golden pip-pin, and is a rank poison.

MANDREL, a kind of wooden pulley, which makes part of a turner's lathe. Of this there are several kinds, as the *flat mandrel*, for turning flat boards on; the *pin mandrel*, which has a long wooden shank to fit into a round hole made in the work to be turned; the *hollow mandrel*, for turning hollow work; and a *screw mandrel*, for turning screws, &c.

MANGALIS, an East Indian weight for diamonds, pearls, &c. equal to five grains British.

MANGANES, (*GER.* *Braunstein*, *Glasseise*, *DU.* *Bruinsteen*, *DA.* *Bruunsteen*, *Sw.* *Brunsten*, *FR.* *Manganèse*, *Ma-*

gafèse, *Magne*. *Savon du verre*. *It.* *Manganesia*. *Sp.* *Manganesia*, *Marganese*. *Port.* *Manganesia*. *Rus.* and *Pol.* *Magnesia*. *Lat.* *Magnesia nigra*, *Manganesium*,) is a brilliant metal, of a darkish white colour, inclining to grey, very brittle, of considerable hardness, and of difficult fusibility. Its specific gravity is about 8.00. When exposed to the air, it absorbs oxygen rapidly, and falls into powder. On account of its great affinity for oxygen, it is never found in a metallic state, and most usually in that of an oxyd. It is found in Devon and Somersetshire; in America, and various parts of the continent of Europe: usually in large shapeless masses of oxyd; but sometimes in prismatic crystals of the colour of steel.

The oxyde of manganese is of considerable use; it is employed for making the oxymuriatic acid, for forming bleaching-liquor. It is also used in glazing black earthen-ware; for giving colours to enamels; and in the manufacture of porcelain. It is the substance generally used by chemists for obtaining oxygen gas.

MANGEL WURTZEL, is a species of beet-root, the culture of which has been very confined in this country till lately, though commonly grown in others, especially in Germany. It differs materially in the size to which it will grow, in proportion to the strength of the soil on which it is produced, and which it is thought very much to exhaust. The roots vary from 10 to 20*lb.* in weight. Fifty tons per acre have been obtained upon good loam. It will fatten every species of cattle with greater rapidity than any other plant, and is peculiarly excellent for the food of milch cows; not only increasing the quantity of their milk, but enriching it beyond any other vegetable. It is reasonably conjectured, that it will yield sugar, and spirit, in considerable proportions.

MANGO, a sort of fruit of a remarkably hot flavour, which is brought from the island of Java. It is used as a pickle.

MANHEIM GOLD. *See* **ORSIDUE**.

MANIFEST, is a regular list of a ship's cargo, containing the mark and number of each separate package, the names of the persons by whom the different parcels of goods are shipped, and those of the persons to whom they are consigned; a specification of the quality of the goods contained in each package, as rum, sugar, tea, coffee, &c. and also an account of the freight that the captain is to receive from the consignee of such goods, on his arrival, corresponding with the bills of lading which he has already signed. The manifest is usually signed by the ship-broker who clears the vessel out at the custom-house, and by the captain, and serves as a voucher for the latter, whereby to settle his account with his owners, &c.

Abstract of an act for regulating the production of manifests, and for more effectually preventing fraudulent practices in obtaining bounties and drawbacks, and in the clandestine re-landing of goods. 26 Geo. 3. c. 40.

Sec. 1. *Manifest of goods on board.*—From the times hereinafter mentioned, no goods shall be imported into Great Britain from parts beyond the seas, in any ship or vessel belonging to His Majesty's subjects, unless the master or commander thereof shall have on board a manifest, or content, in writing, signed by such master or commander, containing the names of the several ports or places where the goods; in such manifest mentioned, shall have been respectively laden, the name and build of such ship or vessel, and the true admeasurement or tonnage, according to the register, with the christian and surname of the master or commander, the port to which such ship or vessel belongs; and a true account of all the cargo, and of all packages of goods, so laden on board, with the several marks; and the particulars of the cargo which is stowed loose; and of the following particulars, in words at length, that is to say, the several and respective numbers of the packages, with a particular description thereof, whether leaguer, pipe, butt, puncheon, hogshead, barrel, or other cask or package, describing such other cask or package by its usual name; or whether case, bale, pack, truss, chest, box, bundle, or other package, or by such other name or description as the same is usually called or known.

2. *Manifest of wine.*—No wine shall be imported into Great Britain, from any foreign parts not belonging to Great Britain, in any ship or vessel, unless the master or commander thereof shall have on board a manifest, in writing, and signed by such master or commander, before the clearing of every such ship or vessel from every such port where such wine shall be laden on board, containing the name of the respective ports or places where the wine, mentioned in such manifest, shall have been so laden on board; the name and build of such ship or vessel, and the true tonnage, or admeasurement of tonnage, thereof; together with the christian and surname of the master or commander, and the port to which such ship or vessel belongs; and a just account of the whole quantity of wine, distinguishing the quantity of each different kind, so taken on board, and of the marks of the different packages, and if known, the names of the persons to whom the wines are consigned; and also, in words at length, the numbers of the packages, with a description thereof, whether leaguer, pipe, butt, puncheon, hogshead, barrel, or other cask or package, or by what name or description such other cask or package is called or known. Provided that nothing

shall extend to permit any goods which are required to be accompanied with certificates and other documents, to be imported into Great Britain without such certificate, &c., but the same shall be accompanied, as well with such certificate, &c., as with the manifest before-directed; and, on failure, the goods shall continue to be liable to all the duties and restrictions, and to the fines and forfeitures, to which the same are subject by law.

(Additional regulations respecting manifests to be brought by masters of vessels from the territories of the East India Company, the Cape of Good Hope, and the island of St. Helena, were made by 54 Geo. 3. c. 36. By these, additional manifests are required from ships arriving from the countries above-mentioned, beside the original manifests. Notwithstanding this statute, however, wines had been commonly imported from the Cape of Good Hope and others of the places specified, without the necessary manifest: an order was given from the custom-house in Dec. 1817, that for the future, the penalties of the said statutes would be strictly enforced.)

3. *How ships are to clear out for Great Britain.*—Before any ship or vessel shall be cleared out for Great Britain, from any foreign parts belonging to Great Britain, the master or commander thereof shall deliver the manifest, in writing, herein-before required, to the collector of the customs there; and, if there shall not be a collector of the customs there, then to the chief officer of the customs; and, if there shall not be any officer of the customs there, then to the principal officer or magistrate, or some other person by him specially appointed, resident at or nearest to such place; which said collector, or other chief officer, &c., shall cause a duplicate to be made, and indorse, upon the original manifest, his name, with the day and year on which the same was produced to such collector, &c., and shall then return the said original manifest, or content, to the said master, on the clearing of any such ship or vessel; and such collector, and other chief officer, shall, upon the clearing of every such ship or vessel, immediately transmit the said duplicate of such manifest to the collector and comptroller of His Majesty's customs at the port in Great Britain to which the goods are consigned, and to which the manifest refers.

4. *How ships with wine are to clear out for Great Britain.*—No sort of wine shall be admitted to an entry into Great Britain, in any ship or vessel whatever, from any port not belonging to Great Britain, unless the master or commander thereof, importing the same, shall, before his departure from the port where such wine is shipped, verify upon oath the truth of the contents of the said manifest before the British consul, or other chief British officer, if there shall be

any such resident at or near the port where such wine shall be taken on board.

5. *Consequence of not having a manifest.*—If any goods shall be imported into Great Britain, in any ship or vessel belonging to his Majesty's subjects, from any foreign parts, without such manifest, or shall not be described therein, or shall not agree therewith; or if any wine shall be imported into Great Britain, by any such ship or vessel, without a manifest so verified as aforesaid; in every such case, the master or commander thereof shall forfeit double the value of such goods, together with the full duties payable on the same.

6. *Manifests to be produced.*—Every master or commander of any ship or vessel, belonging to His Majesty's subjects, laden with goods, and bound to Great Britain, shall, on his arrival within four leagues of the coast, upon demand, produce all such manifests, which such master or commander is required to have on board, to such officer of the customs as shall first come on board his said ship or vessel, for his examination, and shall deliver to such officer a true copy thereof, (which copy shall be provided and subscribed by the said master or commander of the said ship); and that the officer to whom the original manifest shall have been produced, shall certify, upon the back thereof, that the same was produced, and the day and year when, and such copies as aforesaid were to him delivered; and shall likewise certify, upon the back of such copies, the day and year on which the same were produced, and transmit such copies to the respective collectors and comptrollers of the several ports to which the goods, by such manifests, shall appear respectively to be consigned; and that the said master or commander of any such ship or vessel shall produce, to the officer of his Majesty's customs, who shall first come on board such ship or vessel, upon her arrival within the limits of any port in Great Britain, in which the cargo, or any part thereof, is intended to be discharged, such manifest, and also deliver a true copy thereof; the production of such manifest, and the delivery of such copy thereof, shall also be certified to have been produced and delivered, as aforesaid, by the said officer who shall so first come on board the said ship or vessel, on her arrival within the limits of any such port, upon the back of the original manifest, with the day and year, and the time when such manifest was produced to such officer, and when he so received the said copy; and such officer is required to transmit the said copy to the collector and comptroller of that port: proviso, that nothing shall extend to require of such master or commander of such ship or vessel, the delivery of more than one copy of the manifest which he is directed to have on board, to the officer who shall first come on board within four leagues of the coast of Great Britain, and to none other

who shall afterwards come on board within the distance aforesaid; and one other copy to such officer who shall first come on board within the limits of any port in Great Britain; and to none other who shall afterwards come on board within such limits, if such master or commander of any such ship or vessel shall produce to such officer his manifest, with a certificate at the back thereof: proviso, that if any manifest, directed to be delivered up to the collector or comptroller of any port where such ship or vessel arrives, shall contain an account of goods not there to be landed, but which shall appear to be consigned to some other port in Great Britain, then the collector and comptroller shall certify upon such manifest under their hands, such part of the cargo as shall there have been delivered, and shall then deliver back the original manifest to the master; and so in like manner as often as the case shall require, until such ship or vessel shall arrive at her last port or place of discharge.

7. *Refusing to produce manifests.*—If the master or commander of any ship or vessel, laden and bound to Great Britain, shall not, upon his arrival within the limits of any port in Great Britain, or within four leagues of the coast, produce such manifest to the officer of His Majesty's customs, upon demand, and give such copy to the officer who shall first come on board such ship or vessel, upon her arrival within any port in Great Britain, where the cargo, or any part thereof, is intended to be discharged or landed, or shall not give an account of the destination of such ship or vessel, or shall give a false account of the destination thereof, in order to evade the production of the manifest, the master or commander of such ship or vessel shall forfeit double the value of the goods, together with the full duties payable thereon; and if such officer, first coming on board, shall refuse to certify, on the back of such manifest, the production and delivery of such copies as are required to be delivered, every such officer, so neglecting or refusing, shall forfeit the sum of 100*l*.

8. *Breaking bulk.*—If, after the arrival of any ship or vessel laden with goods, and bound to Great Britain, either when within the limits of the ports of Great Britain, or within four leagues of the coast, bulk shall be broken, or any part of the cargo shall be unladen or unshipped, with intention to be laid on land, or unshipped as aforesaid within the limits aforesaid, before such ship or vessel shall come to the proper place for the discharge of her cargo, and shall be there duly authorised by the proper officer of the customs to unlade the same, the master or commander of such ship or vessel, and the mate or other person next in command, shall respectively forfeit 200*l*. except in case of unavoidable necessity, and distress of weather, or other unavoidable accident

or distress; of which distress the master or commander of such ship or vessel shall give notice, and (together with two or more of the mariners on board) shall make proof, upon oath, before the collector or other chief officer of the customs of the port within the limits of which such accident or distress shall happen, or before the collector or other chief officer of the first port in Great Britain within the limits of which such ship or vessel shall afterwards arrive, if the said accident or distress shall have happened, not within the limits of any port, but within four leagues of the coast of Great Britain.

9. If, upon the arrival of any ship or vessel within the limits of any port in Great Britain, for the discharge of her cargo, there shall be any goods which must be unavoidably stowed, either in the cabin, or between the decks, or upon the decks, or in the steerage, fore-castle, or other place out of the main hold, (except such part of the cargo as is stowed in the chains or other parts on the outside of such ship or vessel,) in such case the officer of the customs, who shall first go on board, shall, before he shall leave the ship or vessel, mark or seal such packages, as such officer shall be directed by the commissioners of the customs, or any four or more of them, in England, or the commissioners of the customs, or any three or more of them, in Scotland, and shall keep a particular account; which mark or seal shall not be altered or broken, before the goods contained in such packages shall be landed, either at the quays, or at such other places as shall from time to time be allowed, by special leave from the commissioners and officers of the customs, and an order from the proper landing-waiters, and in the presence of such superior officer or officers, as the said commissioners of the customs, in England and Scotland, shall appoint to see such packages opened.

10. *Marks of packages altered.*—If any of the marks or seals which shall have been put upon any of the packages, shall be altered or broken by the master or commander of the ship or vessel, or by any of the crew, or by any other person with the consent of the said master or commander, every such master or commander, and also the mate, or such person as shall be next in command to such master or commander, shall, for each offence, forfeit 200*l*.

11. *Ships to be entered on arrival.*—The master or commander of any ship or vessel, in which such goods shall be so imported as aforesaid into Great Britain, shall, within twenty-four hours after arrival at such places as shall be fixed upon by the commissioners of the customs, or any four of them, in England, or the commissioners of the customs, or any three or more of them, in Scotland, make entry, upon oath, of the

build, burthen, contents, and lading, of such ship or vessel, with the particular marks, numbers, and contents, of every parcel of goods then laden on board, and perform every act and thing relating thereto, before the collector or other chief officer of the customs at the said port, in the custom-house at the same port, in the manner directed by an act passed in the 13th and 14th of Charles II. intituled, “An act for preventing frauds and regulating abuses in His Majesty’s customs,” under the penalty of 100*l*.; and the said master, or other person, shall, at the time he so makes his report of his ship at the custom-house, deliver to the collector, or other chief officer of the customs at the said port, the manifest, to accompany their cargoes, and to be on board every ship or vessel in which goods shall be so as aforesaid imported into Great Britain, and if the said master or commander of any such ship or vessel shall neglect to deliver such manifest to the said collector, or other chief officer of the customs, at the time he so makes his report, every such master, or other person, shall forfeit 200*l*.

12. *Manifest not agreeing with the cargo.*—If any package whatever, which shall have been reported by the master or commander of any ship or vessel, shall not be found on board the same, in conformity to such report; or if the goods imported shall not agree with the manifests; or if either the reports or the manifests shall not agree with the cargo found on board; then the master or commander of such ship or vessel shall forfeit 200*l*. Provided, that in case any goods shall be imported without such manifests; or in case the manifests, accompanying the goods, shall not agree with the report; or be defaced, or incorrect, or not agree with the goods on board; and it be made appear, to the satisfaction of the commissioners of the customs, that the cargo imported was wholly taken on board in foreign parts, naming the particular places where it was taken on board respectively, and that no part of the cargo has been unshipped since it was taken on board, and that the manifest has been lost or mislaid without fraud or collusion, or that the same was defaced by accident, or incorrect by mistake; in such case, the penalties and forfeitures herein-before inflicted shall not be incurred. Provided, that in case any goods shall, from necessity, be taken on board of any ship or vessel in any foreign port, for Great Britain, after such manifest as is required shall have been attested, in manner herein-before directed, the master or commander of such ship or vessel shall make out a separate manifest of all such goods as shall be so taken on board; which manifest shall be subject to all and every provision in this act contained, in like manner as the manifests are subjected; and, in such case, the penalties,

heroin-before inflicted, with respect to goods imported without a manifest, shall not be incurred, if the urgent necessity of so taking such goods on board shall be made appear to the satisfaction of the commissioners of the customs.

13. *Goods destroyed, except by necessity.*—If any goods, so taken on board in any foreign port, shall, after the arrival of such ship or vessel, within the limits of any port of Great Britain, or within four leagues of the coast thereof, or after the first production of the manifest to the officers of the customs (whether such goods shall be inserted in the said manifests, directed to accompany such goods, or not) be thrown over-board, or staved, or in any manner destroyed, (except in case of unavoidable necessity, proof of which shall be made to the satisfaction of the commissioners of his Majesty's customs) the master or commander of the ship or vessel, on board of which such offence shall be committed, shall forfeit 200*l*.

14. *Importer or consignee to make entry at the customs.*—Every importer, proprietor, or consignee of any goods imported into Great Britain, shall, within twenty days after the master or commander of such ship or vessel shall have made his report upon oath, or after the expiration of the time within which he is required by law so to do, make a due entry with the collector or other chief officer of the customs, at the port where the ship or vessel so laden shall arrive, of all the goods so by them imported therein, or of which they are the importers, proprietors or consignees, and pay the full duties payable for such goods within the time aforesaid; and that, if he or they shall fail in so doing, it shall be lawful for the officers of the customs to convey such goods to His Majesty's warehouse, at the custom-house, for the security of the duties; and, if the full duties are not paid within three months, they should be sold, and the produce applied agreeably to an act of the 12th Queen Anne, intituled, *An Act for the Encouragement of the Tobacco-trade*. Proviso, that nothing shall extend to the selling of any goods, which may be entered and warehoused, upon bond or security being given for the whole of the duties due thereon.

22. *Masters to bring to at the usual places for revenue-officers.*—The master or commander of any ship or vessel, arriving from foreign parts, shall not presume to pass such usual places without bringing to, and receiving the revenue-officers on board; or being outward-bound, for foreign parts, shall not presume to pass without bringing to, at such usual places, for the purpose of the cargo being examined, and of relieving or landing such officers, unless in case of distress of weather, and other unavoidable accident, to be made appear to the satisfaction of the commissioners of the customs:

and that every such master, or other person, who shall pass without bringing to for the purposes aforesaid, shall, for every such offence, forfeit 100*l*.

25. *Revenue-officers to have access to all parts of the ship.*—From the passing of this act, any officer of his Majesty's revenue, properly authorised to examine any ship or vessel, or the cargo on board, shall at all times have free access to the cabin, and every other part or place in such ship or vessel; and, in case any places within the cabin, fore-castle, steerage, or any other part of the ship, or any boxes, chests, or other things contained therein, shall be locked, or in any manner fastened, and the keys shall be withholden, or the places shall not be opened for such officers, on their requiring the same of the master or commander of such ship or vessel, such officers, if they are of a degree superior to tidesmen or watermen, shall, and are hereby authorised and empowered to, open the same in the best manner they can, and are hereby indemnified in so doing; but, if such officers shall only be of the class of tidesmen or watermen, they shall send for their superior officer, who is hereby in like manner authorised to open the same, and is hereby indemnified in so doing.

27. *Who may seize ships or goods, &c.*—It shall be lawful for the commanders of any of His Majesty's ships or vessels of war, or any commissioned, warrant, or petty, officer, specially authorised by them, to seize, without any deputation or commission from the commissioners of the customs or excise, any goods, ships, &c. which shall be subject to forfeiture by this or any other act now in force, for any offence against the revenue. Provided, that the commander of such ship or vessel of war shall bring every such seizure to His Majesty's warehouse, at the nearest custom-house to which such seizure can conveniently be brought, and there deposit the same in the custody of the proper officer of the customs, in case the seizure shall be made under any act for securing the revenue of the customs; or in the custody of the proper officer of excise, in case it shall be made under any act for securing the revenue of excise only; and shall conform to all the rules to which the officers of customs and excise are now, in case of such seizure made by them, subject.

[By the 41 Geo. 3. c. 91. s. 6. any goods seized, for which any excise-duty is imposed, may be lodged in one of His Majesty's warehouses of excise, if the commanding officer deems it expedient, instead of bringing such seizure to the custom-house; and every seizure so brought shall be prosecuted under the directions of the commissioners of excise.]

28. *Witnesses.*—From the passing of this act, any person examined as a witness, shall deliver his testimony upon oath, to be ad-

ministered by the surveyor-general, who shall examine him.

29. *False oath.*—If any person shall be convicted of making a false oath, or of giving false evidence, on his examination on oath before the surveyor-general of the customs, such person so convicted, shall be deemed guilty of perjury, and shall be liable to the pains and penalties to which persons are liable for wilful and corrupt perjury.

30. *Penalties.*—All penalties incurred by this act shall be sued for in such a manner as any penalties incurred, or any goods or vessels forfeited, for any offence against the laws of customs may be sued for; and the officer concerned in such seizures or prosecutions under this act, shall receive such share of the produce arising from the seizures, as they are now by law intitled to upon prosecutions or seizures for unlawful importation, and to such share of the produce arising from any pecuniary fine or composition paid for any offence against this act, as they are now by law intitled to upon prosecutions for pecuniary penalties.

31. *Information.*—From the passing of this act, in case any information shall be commenced and brought to trial, on account of the seizure of any goods, ship, &c. wherein a verdict shall be given for the claimer, and if it appear to the judge that there was a probable cause of seizure, the judge shall certify on the record that there was a probable cause for the prosecutor's seizing the said goods, ship, &c. and, in such case, the defendant shall be intitled to costs of suit, nor shall the persons, who seized the said goods, ship, &c. be liable to any action on account of such seizure; and, in case any action shall be commenced and brought to trial against any person, on account of the seizure of any such goods, ship, &c. where no information shall be commenced or brought to trial to condemn the same, and a verdict shall be given upon such action, against the defendant, if the judge shall certify that there was a probable cause for such seizure, then the plaintiff, besides his goods, &c. so seized, or the value thereof, shall not be intitled to above two-pence damages, nor to any costs of suit, nor shall the defendant in such prosecution be fined above one shilling.

33. *Seizures to be sold by public auction.*—From the twenty-ninth of September, 1786, all ships and vessels, and all goods, which shall be seized in pursuance of any act, made in Great Britain, relative to the trade and revenue of the British colonies or plantations, and which shall be condemned there, shall be sold by public auction, to the best bidder, at the custom-house, by the collector and comptroller of the customs for the island, colony, or plantation, in whose custody such vessel, ship, or goods, shall be lodged and secured; and the produce of such sale shall be accounted for and applied,

by such collector and comptroller, or other principal officer of the customs, according to law, subject to the direction of the commissioners of customs in England, or any four or more of them.

By 53 Geo. 3. c. 155. & 54 Geo. 3. c. 36. the master of every vessel belonging in whole or in part to His Majesty's subjects, arriving in Great Britain from any place within the limits of charter of the East India Company, from the Cape of Good Hope, or from St. Helena, shall have on board a manifest, as directed by 26 Geo. 3. c. 40. and shall produce and deliver such manifest, as directed by that act. And no goods shall be imported into Great Britain from any of the places before-mentioned, unless the master of such vessel shall have on board a manifest, signed by such master, and containing the particulars described in that act; nor shall any vessel be permitted to clear out from any port of the United Kingdom, for any place within the said limits of the said Company's charter, without a like manifest.

And the names of the places where the goods were taken on board, and those of the persons to whom consigned, shall be inserted in such manifest; and the places where stowed in the ship, viz. in the hold, and elsewhere, shall be distinguished; and if any alteration of stowage shall take place, it shall be inserted in a supplementary manifest, sec. 4 & 5.

And such manifests shall be authenticated by the master of the vessel by indorsement of his name, and the date of delivery, &c. and shall be delivered to the persons appointed at each place of delivery, and a duplicate shall be taken and sent to the commissioners of customs in England or Scotland respectively, as the case may require, sec. 6, 7.

All masters of vessels coming from India, and touching at the Cape, or at St. Helena, shall deliver their manifests, authenticated as before described, to the proper officer; which officer shall transmit duplicates thereof to the commissioners of the customs here, and also a separate duplicate of a supplementary manifest of all additional goods taken in at such places, sec. 8, 9.

All goods imported without a manifest, or with an incorrect manifest from the places before-mentioned, shall be forfeited, and the master shall forfeit 50*l.* for each and every package so imported, sec. 12.

MANILLE, a large brass ring, in the form of a bracelet, either plain or engraven, round or flat; they are a principal article of export to the coast of Africa, and were exchanged with the natives for slaves. These people wear them as ornaments on the small part of the leg, and on the thick part of the arm above the elbow. The great men wear manilles of gold and silver, but these are made in the country by the natives themselves.

MANNA. (GER. *Du. Da.* and *Sw. Manna.* FR. *Manne.* SP. *Mana, Mangla, Almangre.* IT. PORT. RUS. POL. and LAT. *Manna.*) Several vegetables afford manna: it is extracted from the pine, the fir, the maple, the oak, the juniper, the fig, the willow, the olive, &c.; but the ash, the larch, and the alhagi, afford it in the largest quantities. Lobel, Rondelet, and others, have observed at Montpellier, upon the olive trees, a kind of manna, to which they have given the name of *aliomeli*. Tournefort collected it from the same trees at Aix and at Toulon.

The ash which affords manna grows naturally in all temperate climates; but Calabria and Sicily appear to be the most congenial countries to this tree; or at least it is only in these countries that it abundantly furnishes the juice called manna in commerce.

The manna flows naturally from this tree, and attaches itself to its sides in the form of white transparent drops; but the extraction is facilitated by incisions made in the tree during summer: the manna flows through these apertures upon the trunk of the tree, from whence it is detached with wooden instruments. Care is likewise taken to insert straws, or small sticks of wood, into these incisions; and the stalactites, which hang from these small bodies, are separated, and known in commerce by the name of *Manna in Tears*: the smallest pieces form the manna in sorts or flakes, and the common or fat manna is of the worst quality, because the most contaminated with earth and other foreign substances.

The larch, which grows abundantly in Dauphiny and the environs of Briançon, likewise affords manna. It is formed during the summer on the fibres of the leaves, in white friable grains, which the peasants collect and put into pots, which they keep in a cool place. This manna is of a yellow colour, and has a very nauseous smell.

The *alhagi* is a kind of broom, which grows in Persia. A juice transudes from its leaves in the form of drops, of various sizes, which the heat of the sun indurates. An interesting account of this tree may be seen in Tournefort's Travels. This manna is known in the Levant, in the town of Tauris, by the name of *Tereniabin*.

The manna most frequently used is that of Calabria. Its smell is strong, and its taste sweetish and slightly nauseous: if exposed on hot coals, it swells up, takes fire, and leaves a light bulky coal.

The best and greatest quantity of manna comes from Sicily. It consists of two sorts, the one called flaky, generally of more than double the value of the other, called manna in sorts. The principal parts of Sicily where this drug is collected, are Cinesi and Geraci. The denomination of Cinesi manna comprehends not only the produce

of Cinesi, but also of the villages of Capace, Carini, Favoretta, &c. So also Geraci manna means not only the manna collected at Geraci, but at Castelbuono, Cefalu, and St. Mauro. The best flaky manna comes from Cinesi and Capace; the very best from Cinesi. It is computed that the four villages of Cinesi, Capace, Carini, and Favoretta, produce on an average above 1400 cantars of manna, whereof four-fifths are in sorts, and twenty-five to thirty cantars flakes. The Sicilian cantar is equal to 196lb. avoirdupois. The crop of Sicilian manna is generally bought up by the merchants of Palermo, at the harvest, which begins in August, and ends in October. The chief market for flaky manna is at Leghorn. The manna in sorts generally goes to Marseilles or the Levant. Tolpha manna is inferior in value to the flaky, but more valuable than manna in sorts. It takes its name from Tolpha, a place in the territory of the Pope. Manna forms the basis of many purgative medicines.

MAN OF WAR, a large ship, carrying from 20 to 120 guns, invariably employed in naval engagements. See SHIP.

MANSIA, a Persian weight, equal to 12lb. avoirdupois.

MANUFACTORY denotes a place where several artificers are employed in making a commodity, as *manufacture* is the work itself. See titles EUROPE, ASIA, AFRICA, and AMERICA, for accounts of different branches of industry.

Many acts of parliament have been passed for the encouragement and regulation of manufactures. Persons exporting the tools or utensils used either in the silk, linen, or woollen manufactures, incur a forfeiture, and the sum of 200*l.*; and if the captain of the ship be acquainted with such illegal proceeding, he is liable to pay a fine of 100*l.* The forfeiture of the articles and 200*l.* is farther imposed upon all persons collecting them for the purpose of exportation; and if the captain of a king's ship, or officer of the customs, knowingly suffer such exportation, both incur a penalty of 200*l.* lose their employment, and are for ever incapacitated from holding any office under government. Persons having tools in their possession, or procuring them to be made with a view to exportation, are also subject to forfeiture of the same, together with 200*l.* and to imprisonment for 12 months; and every person exporting such tools shall forfeit them, together with 500*l.* See titles ARTIFICER and WOOL.

MANUMISSION, the act of enfranchising, or giving freedom to, a slave or person in a state of bondage, by a master or owner. The forms preserved in executing this ceremony have been various at different periods, and in different countries. The Justinian code presented the mode to be adopted by the Romans. During the con-

tinuance of the feudal system, introduced into this kingdom by William the Norman, villains were manumitted by proclamation in the county court. There was also an implied sort of manumission practised, by treating the slave as a freeman; as by executing an obligation for payment of money to him, &c. The subject has little interest here now, beyond that excited by curiosity; but in America and the West India islands, it is still of some importance: in some parts of those countries it is effected by a kind of registration before certain public authorities; in others merely by a private certificate of enfranchisement. An extraordinary fact is attested by recent travellers on that continent, viz. that the most numerous impediments to the manumission of slaves are to be found in those provinces of the United States whose general laws and constitutions were founded on the basis of liberty.

MANURES. Manuring land is the act of ameliorating the soil, by applying thereto some matter proper for its fertility.

Under the term *manures* may be included chalk, lime, shells, bones, gypsum, marl, clay, sand, pond-mud, pond-weeds, ashes, soot, sea-weed, salt, rape-dust, malt-dust, yard-dung, pigeons' dung, rabbits' dung, night-soil, &c. &c.

Chalk is used to great advantage as a manure on some wet, stiff soils, having no calcareous earth; in quantity, from 50 to 80 cart-loads per acre; but there are many soils which derive no benefit from it.

The best method of using it, is to spread it early in the autumn, in order that it may be thoroughly drenched with rain, that the frost may have its full operation upon it; by which means it is well pulverised when the thaw comes on, and will mix the more readily with the soil.

Old grass-lands on wet, sandy, or clayey soil, over-run with furze or rushes, are greatly improved by chalk.

But it is to be observed, that land once completely chalked, after its fertilising power appears to be exhausted, seems deteriorated by the use of it.

Lime not only acts as chalk, into which it is converted, but it destroys and decomposes weeds, when laid on fallows. It may likewise be mixed advantageously with green weeds, in alternate layers, for this purpose, and the result will be a beneficial manure.

Turf-ashes, if spread on poor chalky thin lands for turnips, at the rate of about 20 cart-loads of 30 bushels each per acre, will seldom fail to produce a good crop; and it is well known, that if once a good crop of turnips, can be obtained on such poor lands, a good foundation is laid for future improvements. Ashes of all sorts improve wet soil.

Bone-dust is perhaps of all manures the most universally advantageous as a manure. Its effects upon the soil, are in the highest

degree beneficial; and its durability does not constitute the least portion of its value.

Marl. The term marl is employed in a very comprehensive sense, including a variety of substances, very different in external appearance, and varying greatly, if not in the nature of their constituent parts, at least in the proportions in which these are arranged in the mass. The most common varieties are distinguished by the appellations of clay-marl, slate-marl, and stone-marl; the first of these kinds only is generally beneficial. The criterion of the excellence in marl is, chiefly, being greasy to the touch when moist; and friable when dry. Another is its fermenting with any strong acid, such as aqua fortis, or muriatic acid. Marl of this description, when put into water, will fall to pieces, allowing a considerable portion of sand to sink to the bottom of the vessels; from the application of which simple test the farmer might, in many instances, derive much advantage. There is an excellent kind of marl sometimes met with, which is vulgarly called dove-dung, from its resembling in appearance the dung of pigeons.

The quantity of marl to be used varies according to its quality, and the nature of the soils on which it is used. On a light or sandy soil, two cubic roods of marl, each rood containing 64 solid yards, is reckoned a good covering for a statute acre. On strong retentive clay-land, one rood is generally found sufficient for the same extent of surface. The usual time of marling is in the summer months; beginning in May, when the ploughing is over, and continuing till the commencement of harvest. It is sometimes laid on the green sward in winter; and, after being acted upon by the frost, is ploughed in the following spring, generally for oats. Marling on fallows is also practised to a very considerable extent.

That marl is actually productive of the greatest benefit to the lands on which it is used, is a fact which can admit of no doubt. Much variety of opinion, however, exists, as to the mode of operation by which this benefit is effected, but into these it is beside our purpose to enter.

Sand, as a manure, is of the greatest advantage in some lands. When there is a piece of strong clay-land in tillage, and there is an opportunity of covering it over with sand, the soil will be pulverised, and, opened by this means, will give better crops when in tillage, and when laid down, will produce a finer herbage, less liable to be parched in dry, or trod down in wet seasons.

Turf-ashes are often used for wheat, and sometimes for other crops; but there is no application of them so advantageous as that of using them for turnips.

Coal-ashes are a good manure for the same purpose; but not so much used. They are sown on the land in the spring, at the

rate of four or five chaldrons per acre. Cold, wet, clay meadows are much improved by them, but only those.

Soot is a valuable manure for a top-dressing on sainfoin, clover, lucerne, and meadows: it is usually sown on the land at the rate of 40 or 50 bushels-per acre, early in the spring.

Sea-weed is a very excellent manure, being a mass of vegetable matter strongly impregnated with salt.

Though various experiments have been made, with a view to ascertain the utility of common salt as a manure, yet, from the difference which has been experienced in their results, no very decisive or satisfactory conclusion has hitherto been obtained on the subject.

Rape-dust is another excellent manure, and has been used in several instances with the greatest advantage. The large proportion of oily and mucilaginous matter, which it contains, might indeed induce a belief, *a priori*, that this would be the case.

Soap-suds and woollen rags, &c. have each been used, to a certain extent, as manures in some counties; and with different degrees of success. *Oyster-shells* either calcined, or beaten into powder by a weight, and which are only a fine species of lime, are excellent manure, especially for grass.

Bone-dust, on the same principle, is now in the greatest request.

The dung of those animals which are fed upon the substances constituting in a great measure the subsistence of man, is esteemed more valuable than that procured from animals whose food is of a different description. The dung of swine, of horses fed upon corn, &c. is said to be more beneficial as a manure, than that of cows, sheep, or horses, fed entirely upon grass or hay, but is much too hot in its nature to be used alone, especially pigs' dung.

Refuse leather, and bark from hot-houses, after its office in them has been performed, have been tried, but with less success than might have been expected.

What has been said here respecting manures as applicable to agriculture, is with little variation applicable also to horticulture. See further title AGRICULTURE.

MAP, (*Maps*, GER. *Landkarten*. DU. *Kaarten*. DA. *Landkarter*. SW. *Landkarter*. FR. *Cartes géographiques*. IT. *Carte geografiche*. SP. *Mapas*. PORT. *Mapas, Cartas geographicas*.) a plane figure, representing the surface of the earth, or a part thereof. In maps these three things are essentially requisite. 1. That all places have the same situation and distance from the great circles therein, as on the globe, to show the parallels, longitudes, zones, climates, and other celestial appearances, 2. That their magnitudes be proportionable to their real magnitudes on the globe. 3. That

all places have the same situation, bearing, and distance, as on the earth itself.

Maps are not always to be used as they lie before us, for sometimes any part is uppermost; but, generally, the top is the north part, the bottom the south, the right hand the east, and the left hand the west, and marked with these words, or Latin ones of the same import. There is also inscribed a compass, pointing to all the quarters of the world, the north one being marked with a fleur-de-lis.

The degrees of longitude are always numbered at top and bottom, and the degrees of latitude on the east and west sides. In all right-lined and general circular maps, the degrees of latitude on the sides are of an equal breadth; and in all circular and right-lined maps, and the plane charts, the degrees of longitude are unequal.

In general maps the circles corresponding to those in the heavens are inscribed, viz. the equator is expressed by a straight east and west line; and the first meridian, the polar circles, the tropics, and the other meridians, and parallels, which are drawn every five or ten degrees, intersect each other at right angles.

MAPLE. (GER. and DU. *Ahorn*. DA. *Valbirk*. SW. *Loun*. FR. *Etable*. IT. and PORT. *Acero*. SP. *Arce*. RUS. *Klen*. POL. *Klon*. LAT. *Acer*.) The wood of the common maple-tree, is much used by turners, being superior to beech. When it abounds with knots, it is valuable for the purpose of inlaying. It is used in the manufacture of musical instruments, being remarkably white, and may be turned so thin as to be nearly transparent.

The sugar-maple is so called from its juice, exuding from the boll, on incision of the bark, affording sugar when boiled. It is much cultivated in America for this purpose, and to a certain degree in France. A middle-sized tree will yield 50 or 40 quarts of juice in the months of April and May, without injury to the tree; and on boiling, the produce of sugar will be a twentieth part of the weight of juice. No tree is more easily cultivated; and it is raised by seeds, by cuttings, and by layers; which will grow in most soils, but thrive best, and produce most, in a dryish mould.

MARAVEDIE, or MARVADIS, a small Spanish copper coin, value $\frac{4\frac{3}{4}}{27\frac{1}{2}}$ d. sterling. See MONIES, *App*.

MARBLE, (GER. DA. SW. RUS. and LAT. *Marmor*. DU. *Marmer*. FR. *Marbre*. IT. *Marmo*. SP. *Marmol*. PORT. *Marmore*. POL. *Marmur*.) a genus of fossils, composed chiefly of lime; being a bright and beautiful stone moderately hard, not giving fire with steel, fermenting with, and soluble in, acid menstrua, and calcining in a slight fire.

The colours by which marbles are distinguished are almost innumerable; but the most remarkable are, 1. The black marble

of Flanders. 2. Plain yellow. 3. Yellow with some white veins. 4. Yellow with black dentrites. 5. Yellow with brown figures resembling ruins. 6. Black and yellow. 7. Black and white. 8. Pale yellow, with spots of a blackish-grey colour. 9. Yellow, white, and red. 10. Pale yellow. 11. Olive-colour, with deeper-coloured cross lines, and dentrites. 12. Brownish-red. 13. Flesh-coloured and yellow. 14. Common red marble. 15. Crimson, white, and grey. 16. Reddish-brown lumps, on a whitish ground. 17. Blueish-grey. 18. Snowy-white. The finest solid modern marbles are those of Italy, Blankenburg, France, and Flanders. Great quantities of very beautiful marble have been lately discovered at Portsoy in the northern parts of Scotland, and in some of the western isles; in the county of Kilkenny, in Ireland, is found abundance of beautiful black marble, with white spots elegantly mixed through it, called *Kilkenny marble*.

Derbyshire is the county of England most abounding in this mineral. Near Kemlyn-bay, in the county of Anglesea, there is a quarry of beautiful marble, called *verde di Corsica*, being common to this place, some parts of Italy and Corsica. Its colours are green, black, white, and dull purple, irregularly disposed. Italy is that part of Europe which produces the most valuable marble, and in which its exportation makes a considerable branch of foreign commerce. The black and the milk-white marble, coming from Carara, a town in the duchy of Massa, are particularly esteemed.

Those of Germany, Norway, and Sweden, are of a very inferior kind, being mixed with a sort of scaly lime-stone.

Marble is of so hard, compact, and fine a texture, as readily to take a beautiful polish. The marble most esteemed by statuary is that which is brought from the island of Paros, situate in the Archipelago: this was the species of marble employed by the prince of sculptors, Praxiteles, and by Phidias, both of whom were natives of that island, whence the famous Arundelian marbles at Oxford were brought.

The marble of Carara is likewise in high repute among sculptors, and is so much sought after, that, according to an Italian writer, the quarries which produce it yield their proprietor an annual income of nearly 17,000*l*.

The specific gravity of marble is from 2,700 to 2,800; that of Carriera, a very fine Indian marble, is 2,717. Black marble owes its colour to a slight mixture of iron.

MARBLE, *polishing of*, is performed by first rubbing the marble well with free-stone or sand, till the strokes of the axe are worn off, then with pumice-stone, and afterwards with emery.

To make artificial marble. — Provide a flat and smooth piece of marble of the size

and shape desired. Make a border or wall, to encompass it, with wax or clay. Provide next several glazed pipkins, and as many colours as are to be employed; viz. white lead, vermilion, lake, orpiment, masticot, Prussian-blue, &c. Melt some brimstone in the pipkins over a slow fire, and put one particular sort of colour into each pipkin and stir it well with the brimstone. Oil the marble slab well all over within the wall, and then drop on it from one of the pipkins spots of different sizes; then from another the same; from a third the same, and so on till the number of colours necessary to be inserted in the projected mass are deposited. The next thing to be provided is the ground of the intended slab. If it be grey, it will be obtained by mixing fine sifted ashes; if red, ochre; if white, lead; if black, bone-charcoal; with brimstone. This, when melted and well-mixed, must be poured pretty hot over the slab thus prepared with the coloured spots, with which it will incorporate. The mass must be sufficiently thick to fill the receptacle to the top of the border of circumvallation, so that a dry and smooth board laid upon it while hot will come in contact with, and adhere to, the whole surface. Let it lie till cold, and then take up the board to which the manufactured slab will adhere. Polish the surface with oil and a cloth, and it will imitate marble closely.

MARBLING, in general, the painting any thing with veins and clouds, so as to represent those of marble. Marbling of books or paper is performed thus: Dissolve four ounces of gum arabic in two quarts of fair water; then provide several colours mixed with water in pots or shells, and with pencils peculiar to each colour, sprinkle them by way of intermixture upon the gum-water which must be put into a trough, or some broad vessel; then with a stick curl them or draw them out in streaks, to as much variety as may be done. Having done this, hold your book or books close together, and only dip the edges in, on the top of the water and colours very lightly; which done, take them off, and the plain impression of the colours in mixture will be upon the leaves; doing as well the ends, as the front, of the book in the same manner.

Marbling books on the covers is performed by forming clouds with aqua fortis, or spirit of vitriol mixed with ink, and afterwards glazing the covers.

MARBLE-PAPER, (GER. *Türkisches papier*. DU. *Turksch papier*. DA. *Tyrkish papir*. SW. *Turkish papper*. FR. *Papier marbré*. IT. *Marmorata, turca*. SP. *Papel pintado*. PORT. *Papel pintado de pedra*. RUS. *Turczkaja bumaga*. POL. *Turecki papier*.) paper coloured with veins and clouds, so as to appear like marble, used for covering and lining books, &c. See MARBLING.

MARCASITE. This name has long

been given to all sorts of minerals, ores, pyrites, and semi-metals. It seems to be confined to pyrites: and Wallerius proposes to apply it to only such pyrites as are regularly formed. The word is little used at present.

MARCO, a weight used at Goa, of eight ounces Portuguese, or a demi rotoli. See **WEIGHTS AND MEASURES**.

MARINE STORES. See 1 & 2 Geo. 4. c. 75. & 76.

MARJORAM, an aromatic herb, useful in pharmacy as a snuff, and infused in water as a tea; it also yields an essential oil, beneficial for tooth-ache. The tops when young make a purple dye. We import it from Italy, and grow a good deal at home, but it will not seed in so cold a climate as ours. Oil of marjoram is obtained from this plant.

MARGODES, a blueish grey stone, entirely resembling clay in its outward appearance, but so hard as to cut spars or even zeolites, though not to such a degree as to give fire with steel.

MARK, or **MARCO**, denotes a weight used in several parts of Europe, and for several commodities, especially gold and silver. In France the mark is divided into 8 oz. or 64 drachms, or 192 deniers or pennyweights, or 160 esterlins, or 300 mailles, or 640 felins, or 4608 grains. In Holland the mark weight is also called troy-weight, and is equal to that of France. When gold and silver are sold by the mark, it is divided into 24 carats.

MARK is also used among us for a money of account, and in some other countries for a coin. The English mark is two-thirds of a pound sterling, or 13s. 4d., and the Scotch mark is of equal value in Scotch money of account. The mark-lubs, or Lubeck-mark, used at Hamburg, is also a money of account, equal to one-third of the rix-dollar, or to 10d. sterling. Mark-lubs is likewise a Danish coin equal to 16 sols-lubs. Mark is also the name of a silver and copper coin in Sweden. See **MONIES**, App.

MARK of goods. A certain mark is affixed to goods, to ascertain their property and quality; and if one person shall use the mark of another, with intent to do him damage, upon an injury being sustained, an action on the case will lie. Certain marks are also affixed, to show where the goods were made, and by whom, and also to denote, in various articles subject to the excise, whether they were surveyed by the proper officers, &c. The marks put upon packages of goods are always inserted in the margins of the invoice and bill of lading, as well as in the ship's manifest.

MARKET, a public place in a city or town where provisions are sold; no market is to be kept within seven miles of the city of London; but all butchers, victuallers, &c. may hire stalls and standings in the flesh-markets there, and sell meat and other provisions. Every person who has a market

is entitled to receive toll for the things sold in it; and, by ancient custom, for things standing in the market, though nothing be sold; but by keeping a market in any other manner than it is granted, or extorting tolls or fees where none are due, they may be forfeited.

In London every shop in which goods are exposed publicly to sale, is market overt for such things only as the owner professes to trade in: though if the sale be in a warehouse, and not publicly in the shop, the property is not altered. But if goods are stolen from one, and sold out of the market overt, the property is not altered, and the owner may take them wherever he finds them. 5 Rep. 83.

If a man buy his own goods in a market, the contract shall not bind him, unless the property had been previously altered by a former sale.

MARKET PRICE, an expression not unusual in contracts, whereby a person engages to furnish another with articles of consumption from time to time, according to the average price of similar commodities, in the market of the place, at the time of each delivery.

MARL, or **MARLE**, (GER. DU. DA. and Sw. *Mergel*. FR. *Marne*. IT. SP. and PORT. *Marga*. RUS. *Tschernosem*, *Nowos*. POL. *Margiel*. LAT. *Marga*.) See title **MANURE**.

MARL, bituminous, is found in different parts of Germany. Colour greyish or brownish-black. Found massive. Shistose. Plates flat or waved. Opaque. Feels soft. Easily broken. Moderately heavy. Effervesces with acids. Burns before the blow-pipe, leaving black scoriae.

MARLINE. Long wreaths of untwisted hemp dipped in pitch, with which cables are guarded.

MARLING, in sea-language, means the winding any small line about a rope, so as to prevent its giving way from being worn through by friction.

MARMALADE, or **MARMALET**. (GER. DU. DA. SW. and FR. *Marmelade*. IT. *Colognato*. SP. and PORT. *Marmelada*. LAT. *Miva*, *Marmela*.) The skins of quinces, oranges, &c. cut very small. and boiled into a consistence with sugar.

The Scotch are celebrated for marmalade of oranges, and it makes an increasing article of domestic traffick. It is an excellent substitute for honey, and many persons use it spread on bread who are forbidden to eat butter.

MARMOTS, (GER. *Murmeltiere*, *Marmotten*. DU. *Marmeldier*, *Marmot*. DA. *Murmeldyr*. SW. *Mormeldjur*. FR. *Marmotte*. IT. *Marmotta*, *Montanello*, *Marmontana*, *Varosa*. SP. and PORT. *Marmota*. RUS. *Surik*. LAT. *Marmota*.) likewise called the Alpine mice, are rather bigger than the rabbit, and are much valued on account of

their skins. The marmots of Switzerland, Savoy, and the Alps, differ materially from those of America, which are more thickly-covered with hair, and whose colour is a much finer grey. The skins of marmots are sometimes dyed brown or black, in the hair, in which state, as well as in their natural colour, they are made into muffs, trimmings for garments, &c.

The marmots of Kamtschatka are remarkable for the variety of their colours. The inhabitants of the country do not esteem the skins of these animals. They should never be purchased when they are cut or torn in any part, except immediately under the belly of the animal; for if they are thus injured, there will be found some difficulty in making use of them, especially for muffs.

MARQUE. See **LETTERS OF MARQUE.**

MARQUETRY, or **INLAID-WORK**, (*GER. Ingelegte, Arbeit. Du. Ingelegd werk. DA. Indlagd arbeide. Sw. Inlagd arbete. FR. Marqueterie. IT. Tarsia. SP. Taracea. PORT. Embufido Tauria. LAT. Vermiculatum opus.*) is a curious work, composed of several fine, hard, pieces of wood, of various colours, fastened in thin slices on a ground, and sometimes enriched with other matters, as silver, brass, tortoise-shell, and ivory; with these assistances, the art is now capable of imitating any thing, whence it is by some called the art of painting in wood.

The ground, on which the pieces are to be arranged and glued, is usually of well-dried oak or deal; and is composed of several pieces glued together, to prevent its warping. The wood to be used in marquetry is reduced into leaves, of the thickness of a line, or the 12th part of an inch, and is either of its natural colour, or stained, or made black to form the shades by other methods: this some persons perform by putting it in sand, heated very hot over the fire: others by steeping it in lime-water and sublimate; and others in oil of sulphur. The wood being of the proper colours, the contours of the pieces are formed according to the parts of the design they are to represent: this is the most difficult part of marquetry, and that which requires the most attention. The two chief instruments used in this work are a saw, and a wooden vice, which has one of its chaps fixed, and the other moveable, and which is open and shut by the foot, by means of a cord fastened to a treadle.

The whole is put into a press to dry, polished with the skin of the sea-dog, wax, and shave-grass, as in vaneering; only that, in marquetry, the delicate parts are touched up with a graver.

MARTEN. (*GER. Marder, Baummarder. Du. Marter, Boommarter. DA. Maar, Turmmaar. Sw. Mård. FR. Martre. IT. Martora. SP. and PORT. Marta. Rus.*

Kunika. POL. Kuna. LAT. Martes.) The marten is an animal of a very elegant appearance. Its general length, from nose to tail, is about a foot and a half, and the tail is ten inches long. The marten is of a blackish tawny colour, with a white throat; and the belly is of a dusky-brown; the tail is bushy, and of a darker colour than the other parts; the ears are moderately large, and rounded, and the eyes lively. It breeds in the hollows of trees, and brings forth from three to five young. It is met with in most parts of Europe.

The skin of the marten, especially that of the throat, is principally used in trimming the garments of females, and the official dresses of magistrates, &c. The other parts of the skin are made into muffs, &c. The nearer to the north this animal is found, the finer is the skin, and the more varied its colours; thus North America furnishes fur of this description, of every colour, from a perfect white to a deep black. America, Russia, Prussia, Poland, Norway, and the Levant produce the finest marten-skins.

MARTINGAL, a broad strap made fast to the girths and the belly of a horse, and running between the two legs, to fasten the other end under the noseband of the bridle.

MAS, or **MACE**, a sort of small weight, used in China, particularly on the side of Canton, for weighing silver. See **CONDORIN**.

MASLIN, signifies *mixed*, and when applied to bread, means bread of mixed flour, as of wheat and rye, or wheat and barley.

MASON, a person employed under the direction of an architect, in raising a stone-building.

MASSICOT, **MASTICOT**, or **YELLOW LEAD**, (*GER. Bleygelb. Du. Loodgeel. DA. Blygeult. Sw. Blygult. FR. Massicot. IT. Minio giallo. SP. Ancorea, Jenoli. PORT. Janolim, Masicote. LAT. Minium flavum.*) white-lead calcined over a moderate fire. Although it is called yellow lead, it is not only yellow, but white, and of a deep gold colour occasionally. It is employed in oil-painting, and in glazing pottery.

MAST, *Masts*, (*GER. and Du. Masten. DA. and Sw. Master. FR. Mâts. IT. Alberi di nave. SP. Palos. PORT. Mastros. Rus. Matschi.*) in naval architecture, a large timber in a ship, for sustaining the yards, sails, &c.

In large vessels there are four masts, viz. the mainmast, foremast, mizenmast, and bowsprit. The mainmast is the principal one, standing in the middle of the ship: its length, according to some, should be $2\frac{1}{2}$ that of the midship beam. Others give the following rule for finding its length, viz. multiply the breadth of the ship, in feet, by 24; from the product cut off the last figure towards the right hand, and the rest will be the length required. Thus, suppose the

length of the midship-beam was 30 feet; then $30 \times 24 = 720$, from which cutting off the last figure, there remain 72 feet for the length of the mainmast; and as for the thickness of the mainmast, it is usual to allow an inch to every yard in length. See SHIP.

MASTERS OF SHIPS. Nothing more materially concerns the master of a ship, than to know what degree of responsibility is attached to his situation, and what privileges it invests him with. The master and owner are so intimately connected together, that many observations, which will be found under the article **OWNERS OF SHIPS**, are equally applicable to the one and the other, and will prove to be necessary knowledge for the master of a ship. The doctrine of marine insurances, too, he should be well acquainted with, in order that he may not, by his conduct, inadvertently prejudice his owner's claim on the underwriters.

Masters of ships responsible for goods committed to their charge.—The law makes no distinction between carriers *by land* and carriers *by water*; and, for whatever losses, that arise from the neglect of persons employed under them, they are answerable; whatever cases, therefore, are applicable to carriers by land, must be understood to be equally so to carriers by water, such as masters of ships or hoymen.

The masters of vessels laden with coals are directed, by 47 Geo. 3. sess. 2. c. 68. s. 24. to deliver on arrival at or to the westward of Blackwall, Gravesend, or moorings for the delivery in the port of London, a copy of the certificate originally delivered to them by the fitters or vendors, as enacted in the 9th year of Queen Anne.

The master of a ship is liable for goods of which the ship is robbed in the river.—The reasons are: 1. Because he is an officer known. 2. Because he receives his salary out of that which is paid for the freight. But the master may reimburse himself out of the mariners' wages for a loss happening by their neglect.

Masters are charged to carry goods against all events but the acts of God and the king's enemies.—The plaintiff put goods on board the defendant's hoy, who was a common carrier. Coming through bridge, by a sudden gust of wind, the hoy sunk, and the goods were spoiled. The plaintiff insisted that the defendant should be liable, it being his carelessness in going through at such a time; and thence inferred, the defendant was answerable for all accidents, which would not have happened to the goods in case they had been put in a better hoy. But the defendant was held not answerable, the damage being occasioned by the act of God: for, though the defendant ought not to have ventured to shoot the bridge, if the general bent of the weather had been tempestuous, yet this, being only a sudden gust of wind, has en-

tirely altered the case: and no carrier is obliged to have a new carriage for every journey; it is sufficient if he provides one which (without any extraordinary accident) will probably perform the journey.

In the case of *Forward against Pitard*, 1 Term R. 27. the plaintiff had delivered goods to the defendant, who was a common carrier; and which goods were afterwards destroyed by accident of fire. The question was, whether the defendant was answerable for them.

Lord Mansfield said, "It appears from all the cases, for an hundred years back, that there are events for which the carrier is liable, independent of his contract. By the nature of his contract, he is liable for all due care and diligence; and for any negligence, he is sueable on his contract. But there is a farther degree of responsibility, by the custom of the realm; that is, by the common law, a carrier is in the nature of an insurer. It is laid down that he is liable for every accident, except by the act of God or the king's enemies: now, what is the act of God? I consider it to mean something in opposition to the act of man; for, every thing is the act of God that happens by his permission; every thing by his knowledge. But, to prevent litigation, collusion, and the necessity of going into circumstances impossible to be unravelled, the law presumes against the carrier, unless he shows it was done by the king's enemies, or by such act as could not happen by the intervention of man, as storms, lightning, and tempests.

If an armed force come to rob the carrier of the goods, he is liable, and the reason is, for fear it may give room for collusion, that the master may contrive to be robbed on purpose, and share the spoil.

And it has been said by Lord Kenyon, that there is a difference where a man is chargeable by the general law, and where on his own contract. Thus, as to common carriers, who are chargeable, by operation of law, for all losses, (except those arising from the act of God or the king's enemies,) they cannot discharge themselves from this responsibility by an act or agreement of their own. But, where a man is chargeable on his own contract, he may qualify it as he thinks fit. *Hyde v. Proprietors of the Trent Navigation*. Trinity Term, 33 Geo. 3.

Notwithstanding, however, this observation of Lord Kenyon, the merchants of London agreed upon a new form for their bills of lading, in order to discharge themselves from the responsibility here mentioned. The difference between the new and former bills of lading consists in the introduction of an exception, which runs in these words: "*The act of God, the king's enemies, fire, and all and every other dangers and accidents of the seas, rivers, and navigation, of whatever nature or kind soever, save risk of boats, so far as ships are liable thereto, excepted.*"

It is, however, proper to observe, that, if no bill of lading be signed, then the master, or owner, is bound by the general law of the land, as above-mentioned.

Goods lost in a lighter.—If goods are lost after the owner of them has taken them from the ship into a lighter, it is his own loss; but it is otherwise, if the goods are sent from the ship by the ship's boat, which is considered as part of the ship and voyage. Yet, if the owner of any goods send his servant with them, the carrier or lighterman is not liable if they be lost; yet, see *Robinson v. Dunmare*, 2 Bos. and Pul. 416.

Passengers dying on board.—If any passenger die on board, the master is obliged to take an inventory of his effects; and, if no claim be made to them within a year, the master becomes proprietor of the goods, but answerable for them to the deceased's legal representatives. Bedding and furniture become the master's and his mate's; but the clothing must be brought to the mast-head, and there appraised and distributed among the crew.

Captain dying.—If a captain die, leaving money on board, and the mate, becoming captain, shall improve the money, he shall, on allowance for his care, account both for interest and profits.

Master to agree in writing with his seamen.—No master is to proceed on any voyage, for parts beyond the seas, without first coming to an agreement, in writing, with his mariners, for their wages: if he do so, he shall forfeit, for every mariner so taken without written agreement, five pounds. 2 Geo. 2. c. 36. s. 1.

Masters of merchant vessels to bring home seafaring persons.—British governors, ministers, and consuls, residing in foreign parts, are required to provide for seafaring men and boys, subjects of Great Britain, who, by shipwreck, capture, or other unavoidable accident, shall be in foreign parts, or who shall have been discharged there as unserviceable from the royal navy, and send them home as soon as conveniently may be, in any ship belonging to the royal navy, or in any merchant-ship; and every master of a merchant-ship homeward-bound, is required to take all such seafaring persons on board, (not exceeding four to each ten tons,) and bring them to some port in Great Britain. 52 Geo. 3. c. 33. This, and a previous act on the same subject, are amended by 53 Geo. 3. c. 85. which enacts, that every master of a merchant-ship homeward-bound shall bring home all seafaring subjects, not exceeding four to each 100 tons, who by shipwreck, capture, or other unavoidable accident, shall be in foreign parts, or who shall have been discharged, &c. upon arrival, if he produce to the navy-board a certificate from the governor, minister, or consul, residing where he shipped the men, of the number, names, &c. and his own affidavit,

specifying the time he subsisted them, &c. he shall be allowed 1s. 6d. per diem, for all above his own complement of men.

Masters to keep an account of forfeitures to Greenwich Hospital.—The master of every vessel is required by the 2 Geo. 2. c. 36. to keep a regular account of the penalties and forfeitures due to Greenwich Hospital by the mariners' disobedience, to deduct the same from their wages, and to pay the amount thereof to the collector of the Greenwich Hospital duty, within three months after such deduction, upon pain of forfeiting treble the value thereof to the use of the said hospital.

MASTER and SERVANT. It would be as little useful, as it is practicable, here, to enter into the relations between master and servant under all their different aspects; but there are many views of the subject, under which mercantile men are even more interested in a qualified discussion of the subject than most other persons, and there are others in which all persons are concerned.

The different kinds of servants may be divided into menial servants, apprentices, journeymen, and labourers; there is also a higher species, whom the law denominates servants, although their employment is more in a ministerial, than a servile capacity; such as agents, brokers, factors, &c. whose functions and responsibility will be found under their respective heads.

Menial servants, are so called according to Johnson's definition, from their residing within the walls or house of their employer; and they are hired either in writing, or by a verbal declaration.

The most usual mode of hiring servants, of this description, is by a month's wages or a month's warning, which is the most equitable mode for both parties.

Where the hiring of a servant is general, at a certain yearly rate, this will be construed as a hiring for a year certain; and if such servant depart within the year, he will forfeit all claim to his wages upon the contract, but may, under circumstances, recover in an action for his work and labour.

But if a person retain a servant for a year, and so from year to year, so long as both parties shall agree, and the servant enter upon a second year, that operates as a new contract for that second year, and he must serve it.

If a female servant marry, she must, nevertheless, serve out her term, and her husband cannot take her out of her master's service.

The master may maintain an action against any person who has in any mode deprived him of the service of any of his domestics; and if any servant be disabled in the service of his master, the latter may maintain an action against the party.

The master also may bring an action

against any person seducing or enticing his servant away, and also against such servant for leaving his service; and where, without any enticement, a servant quit his service without just cause, an action will lie against any person retaining him with a knowledge of such departure.

In the enforcement of just and lawful commands, the master is also permitted to correct his servant, provided such correction be given in a reasonable manner.

A servant may justify assaulting another in defence of his master; and in case of any unlawful attack, either upon his person or property, a servant may justify assaulting the assailant, although death should therefrom ensue.

Where a servant acts in pursuance of any authority given him by the master, such master will be responsible.

If a servant retained for a year, happen within the time of his service to fall sick, or to be hurt or disabled by the act of God, or in doing his master's business, yet the master must not therefore put such servant away, nor take any part of his wages for such time. *Dalton, c. 58.*

By 32 Geo. 3. c. 56. the giving false or fictitious characters to servants offering themselves to be hired to others; the forging, altering, or effacing characters actually given, as well as falsely pretending not to have been hired in any previous service, are made offences punishable by fine of 20*l.* with the alternative of commitment to the house of correction for a time not exceeding three months.

The foregoing observations are general, and concern all masters in whatever situation of life they may be placed. Those which follow, more particularly concern mercantile men.

The acts of a servant are in many instances esteemed the acts of the master, by reason of the relationship between a master and a servant; for as in strictness every body ought to transact his own affairs, and it is by the favour and indulgence of the law, that he can delegate the power of acting for him to another, it is highly reasonable that he should answer for such substitute, at least civilly, and that his acts being pursuant to the authority given him, should be deemed acts of the master. *3 Bacon's Abr. tit. Mas. & Ser.*

Therefore if a servant sell a piece of cloth, and warrant it to be good, an action of deceit lies against the master. *Ibid.*

So if the servant sell wine to another which is corrupted, or is guilty of any like deceit, an action on the case lies against the master, though he did not command the servant to sell it to any particular person. *Ibid.*

Also the acts of a servant are deemed the acts of the master, in dealing and contracting for his master, in those things in

which he has a general authority; as if a servant usually buys for the master on credit, and the servant buys some things without the master's orders; yet if the master were trusted by the trader, the master is chargeable, though the things never came to the master's use.

But if a man send his servant with ready money to buy meat or other goods, and the servant buys upon credit, the master is not chargeable. *Show. 95.*

So if the master hath forbid the tradesman to trust his servant, this shall excuse the master on evidence. *Brownl. 64.*

The master must also answer for torts and injuries done by his servant, in execution of his authority; thus where a pawnbroker's servant took a pawn, the pawner came and tendered the money to the servant, who said he had lost the goods, upon which the pawner brought trover against the master, and it was held well. *2 Salk. 421. 1 Ld. Raym. 738.*

So where the plaintiff, according to the common course of dealing, delivered to the defendant's servant an ingot of gold to assay; and it not being returned, brought an action against the master — *Pratt, Ch. J.* directed the jury, that the delivery to the servant was sufficient to maintain the action against the master, on proving a subsequent demand and refusal: so the plaintiff had a verdict. *1 Strange, 505.*

But a master is not liable in trespass for the wilful act of his servant, as by driving his master's carriage against another, done without the direction or assent of the master, but he is liable to answer for any damage arising to another from the negligence or unskilfulness of his servants acting in his employ. *M'Manus v. Crickett, Mic. Ter. 41 Geo. 3. 1 East's Rep. 106.*

Masters are protected against the frauds of their servants, taking the term a servant, in its most comprehensive construction, by divers statutes.

By 21 Hen. 8, c. 7, made perpetual by 5 Eliz. c. 10, if a servant (being of the age of eighteen years, and not apprentice) shall have a casket, jewel, or money, or goods, or chattels of the master, delivered to him by the master to keep, and such servant withdraw himself from the master, and go away with such casket, jewel, money, goods, or chattels, to the intent to steal the same and defraud the master thereof, contrary to the trust and confidence in him put by his master; or else being in the service of his said master, without assent or commandment of his master, embezzle the same, or any part thereof, or otherwise convert the same to his own use, with like purpose to steal it, he shall be guilty of felony, if it be of the value of 40*s.* § 1, 2.

And by 39 Geo. 3. c. 85. If any servant or clerk, or any person employed for the purpose in the capacity of a servant or clerk

to any person whomsoever, or to any body corporate or politic, shall by virtue of such employment receive or take into his possession any money, goods, bond, bill, note, banker's draft, or other valuable security or effects, for or in the name or on the account of his master or employer, and shall fraudulently embezzle, secrete, or make away with the same, or any part thereof; every such offender shall be deemed to have feloniously stolen the same from his master or employer; and every such offender, his adviser, procurer, aider, or abettor, shall be liable to be transported for not exceeding fourteen years, at the discretion of the court.

By 52 Geo. 3. c. 63. every person with whom, as *banker, merchant, broker, attorney, or agent of any description whatever*, any ordinance, debenture, exchequer bill, navy, victualling, or transport bill, or other bill, warrant, or order for the payment of money, state lottery-ticket, or certificate, seaman's ticket, bank-receipt for payment of any loans, India, or other bond, or any deed, note, or other security for money, &c. or any power of attorney for the sale or transfer of any stock, &c. or any plate, jewels, or other personal effects, shall have been deposited, &c. embezzling, selling, negotiating, secreting, or in any manner applying the same to his own use, shall be liable to transportation for 14 years.

Beside these statutes too for the protection of *masters generally* from the embezzlement of their servants and agents, there are a prodigious number for the like purpose applicable only to particular trades. Masters in the silk trade are especially protected by 32 Geo. 3. c. 44.; in the woollen trade, by 14 Geo. 3. c. 25.; in the leather trade, by 15 Geo. 2. c. 8.; in the hat and fur trade, by 22 Geo. 2. c. 27., and 17 Geo. 3. c. 56.; in the cotton manufacture, by 39 & 40 Geo. 3. c. 90.; in the paper manufacture, by 56 Geo. 3. c. 111. See further title SERVANTS, 2 *Dick. Pract. Expos.*

By 58 Geo. 3. c. 51. (which recites the foregoing statutes, relative to the manner of paying wages to servants in money, and prohibiting them from paying the same in goods, &c.) the notes of the Bank of England, as well as of any licensed banker, are made legal tender for wages to servants, and a discharge to the master, on the consent of the servant to receive such in payment.

MASTICH, or **MASTIC**. (GER. *Da.* and Sw. *Mastix*. DU. *Mastik*. FR. *Mastic*. IT. *Mastiche*. SP. *Almastica*, *Almaciga*. PORT. *Almacega*. RUS. *Mastika*. POL. *Mastyks*. LAT. *Resina lentisina*.) The lesser turpentine-tree, and the lentiscus, afford the mastic of commerce. See LENTISCK and GUM.

It is used in fumigations, in the composition of varnishes, and is supposed to

strengthen the gums. The tree which produces the mastic grows in several parts of Turkey, and the isle of Chio, and is brought to us in tears or small lumps from Smyrna and Aleppo.

There is a sort of black mastich brought from Egypt, which serves to sophisticate camphor.

MAT, (*Mats*. GER. and DU. *Matten*. DA. *Matter*. SW. *Mattor*. FR. *Nattes*. IT. *Stucje*, *Stoje*. SP. *Esteras*. PORT. *Esteiras*. RUS. *Progoshki*. POL. *Maty*.) a texture usually formed of sedge, flags, or rushes.

The species of mats manufactured in this country are those which are commonly employed for domestic purposes; such as for spreading in halls, covering the floors, and sometimes benches in public buildings, &c. These mats are generally composed of the materials already mentioned; but there are likewise some which are made from old ropes, and from the hair of horses and other animals. They cannot properly be looked upon as articles of commerce, although they are occasionally exported in small quantities to America, and some parts of Europe. The mats justly entitled to rank as commercial commodities, are those of Russia, of which we annually import a vast number from Petersburg and Archangel. The Russian mats are made from flags and sedge, and are generally of a tolerably close texture, and extremely durable. They are used for packing up household furniture, for covering trunks, cases, &c. destined for exportation, and are employed by gardeners to protect fruit-trees and plants from the inclemency of the weather. On board ship they are of essential service in the stowage of corn and other articles. In France and Spain there is a manufacture of mats entirely made from the article called sparto-grass.

In Spain and Portugal very elegant mats are manufactured from a species of thin reed, of a bright yellow colour. These mats are usually variegated with different colours, and their appearance has a very neat and pleasing effect.

Mats somewhat similar are brought from China, and some from our own possessions in India.

It is remarkable that there is scarcely a savage nation in which mat-making is not cultivated. Captain Cook, in his voyage round the world, found this to be the case among most of the untutored nations which he visited; and he describes the produce of this branch of industry as being chiefly used by the savages for sails to their canoes, or as defensive armour for their persons. On the coast of Senegal, and in several other parts of Africa, abundance of very neat mats is made by the negroes, who dye the substances which they employ in this manufacture with surprising dexterity. Painted or dyed mats are manufactured at Grand Cairo, and most of the sur-

rounding villages; and vast quantities of the article are sent thence to Turkey and the south of Europe.

The inhabitants of Corea, a vast country of Asia, manufacture peculiarly fine mats, which they principally employ as sails for their shipping.

MATCH, a kind of rope slightly twisted and prepared to retain fire for the uses of artillery, mines, fire-works, &c. It is made of hempen tow, spun on the wheel like cord, but very slack; and is composed of three twists, which are afterwards again covered with tow, so that the twists do not appear; lastly, it is boiled in the lees of old wines. This, when once lighted at the end, burns on gradually and regularly, without ever going out, till the whole is consumed: the hardest and driest match is generally the best.

MATE, *on board a ship*, is the second in subordination.

The *mate of a merchantman* takes an account of all the goods received on board, and usually passes a receipt for the same, prior to the bills of lading being signed, and he likewise takes an account of the delivery of all goods from on board the ship. He commands in the absence of the master, and shares the duty with him when at sea.

Mate of a ship of war, is generally appointed by the master. The number of these officers, whether in ships of war or merchantmen, are always in proportion to the size of the vessel. A first-rate man-of-war has six; an East Indiaman the same number; a frigate of 20 guns, and a small merchantman, only one; and the intermediate vessels in proportion to their sizes respectively. On board a man-of-war, the regulation of the watch, the keeping the log-book, examining the line and glasses, adjusting the sails, and attending to the cables, the stowage, the ballast, and the provisions, are duties incumbent on the mates.

All the assistants of the superiors on board, are denominated mates; the surgeon, the gunner, carpenter, boatswain, cook, &c. have their respective mates.

MATRASS, a chemical glass vessel made for digestion or distillation, being sometimes bellied, and sometimes rising gradually tapering into a conical figure.

MATRICE, or **MATRIX**, in dyeing, is applied to the five simple colours, whence all the rest are derived, or composed. These are the black, white, blue red, and yellow, or root-colour.

MATRICES, used by the letter-founders, are those little pieces of copper or brass, on one end of which are engraved, *en creux*, the several characters used in printing. See **LETTER-FOUNDER**.

MATRICES, *in coining*, pieces of steel, in form of dyes, on which are engraved the several figures, arms, characters, legends, &c. wherewith the species are to be stamped.

See **COINAGE**, and **ENGRAVING on steel**.

MATT, *in a ship*, rope-yarn, junk, &c. beaten flat and interwoven; used in order to preserve the yards from galling or rubbing in hoisting or lowering them.

MAUND, an Indian weight.

MAXIMUM, the highest price of any article, as fixed by some law or regulation.

MAYOR, the chief magistrate of most borough towns in England. They are usually justices of the peace for, at least, their year of office. Certificates of the existence of persons, and numerous instruments to be transmitted to the colonies, and even to foreign kingdoms, are generally to be authenticated by the seal of the mayor of some corporation. The Mayor of London is invested with many powers and privileges by statute. See **tiles ATTACHMENT**, *foreign*; **EUROPE**, article **ENGLAND**, **LONDON**, &c.

MEAD, (GER. *Meht*. Mth. DU. *Meede*, *Meedrank*. DA. *Mjød*, *Mjød*. SW. *Mjod*. FR. *Hydromel*. IT. *Idromele*. SP. *Agnamiel*. PORT. *Agua-mel*. RUS. *Lipez*. POL. *Miod*. LAT. *Hydromel*.) an agreeable liquor made of honey and water. Take four gallons of water, and as much honey as will make it bear an egg; add to this the rind of three lemons, boil it, and skim it well as it rises. Then take it off the fire, and add the three lemons cut in pieces: pour it into a clean tub or open vessel; let it work for three days; then skim it well, pour off the clear part into a cask, let it stand open till it ceases to make a hissing noise; then stop it up close, and in three months' time it will be clear and fit for bottling. Makers of mead for sale must take out an excise licence.

MEAL, (GER. *Mehl*. DU. and DA. *Meel*. SW. *Mjöl*. FR. and IT. *Farine*. SP. *Harina*. PORT. *Farinha*. RUS. *Muka*. POL. *Maka*. LAT. *Farina*.) the edible part of wheat, oats, rye, barley, and pulse of different kinds, ground into a species of flour. The difference between flour, properly so called, and meal, is, that the former is freed from the husky part, and other impurities of the species of corn whereof it is made, but the latter is not. Meal is denominated according to the kind of grain that affords it; such as oat-meal, rye-meal, barley-meal, &c. Scotland is famous for oat-meal; England, America, and Normandy in France, excel most in meal of wheat. See **CORN**.

MEASURES. See **WEIGHTS AND MEASURES**.

MECHOACAN, (GER. *Mechoakana*, *Weisse Rhabarber*. DU. *Mechoakana*. DA. *Hvid jalapperod*. SW. *Hvit purgerrot*. FR. *Mechoacan*, *Macadossin*, *Rhubarbe blanche*. IT. *Mechiocan*. SP. *Mechoacan*, *Tucnacho*. PORT. *Mechoacão*, *Feticucu*, *Batatas de purga*. LAT. *Mechoacana*.) or, as it is sometimes called, *white rhubarb*, is a root of a

plant of the convolvulus kind, brought to us from the province of Mechoacan, in South America. It likewise grows in many other parts of America; and in great abundance, according to Savary, in the island of Hispaniola or Hayti. The best sort is in compact, white slices, having a rough bark, and its internal substance equable, without any appearance of fibres. It has a sweetish taste, with a small degree of acrimony. M. Geoffroy is of opinion that mechoacan is one of the safest and best purgatives; and Hoffman orders from the quantity of half a drachm to a drachm of it to be given to children.

MEDIN, a small Egyptian silver coin, equal to three aspers, value 1½*d.* sterling, current at Cairo, Alexandria, Sayd, &c.

MEDAL, a piece of metal in the form of a coin, with some peculiar stamp thereon, destined to preserve to posterity the portrait of some distinguished personage, or the memory of some illustrious action. Italy, Germany, France, and the Levant, abound in dealers in these commodities.

MEDITERRANEAN PASS. The nature of a Mediterranean pass is this; in the treaties that have been made with the Barbary states, it has been agreed, that the subjects of the king of Great Britain should pass the seas unmolested by the cruisers of those states; and for better ascertaining what ships and vessels belong to British subjects, it is provided, that they shall produce a *pass*, under the hand and seal of the lord high admiral, or the lords commissioners of the admiralty. In pursuance of these treaties, passes are made out at the admiralty, containing a very few words, written on parchment, with ornaments at the top, through which a scalloped indenture is made; the *scalloped tops* are sent to Barbary, and being put in possession of their cruisers, the commanders are instructed to suffer all persons to pass who have passes that will fit these scalloped tops. The protection afforded by these passes is such, that no ships, which traverse the seas frequented by these rovers, ever fail to furnish themselves with them; whether in the trade to the East Indies, the Levant, Spain, Italy, or any part of the Mediterranean; and from the more particular need of them in the latter, they, no doubt, obtained the name of *Mediterranean passes*. For the accommodation of merchants in distant parts, blank passes, signed by the lords of admiralty, are lodged with the governors abroad, and with the British consuls, to be granted to those who comply with the requisites necessary for obtaining them.

As this piece of security is derived wholly from the stipulations made by the Crown with a foreign power, the entire regulation and management of it has been under the direction of his Majesty, who, with the advice of his privy-council, has prescribed the terms and conditions on which these passes

shall be granted. Among others are the following: they are to be granted for none but British-built ships, or ships made free, navigated with a master and three-fourths of the mariners British subjects, or foreign protestants made denizens. Bond is to be given in the sum of 500*l.* if the vessel is under one hundred tons, and in 500*l.* if it is of that or more, for delivering up the pass within twelve months, unless in the case of ships trading from one foreign port to another; and such passes need not be returned in less than three years.

It has been found expedient, at the conclusion of a war, and sometimes during a peace, to recall and cancel all passes that have been issued, and to issue others in a new form. This has been done for two reasons. First, That these useful instruments by various means, either accidental or fraudulent, came into the hands of foreigners, who, under cover of them, carried on in security a trade which otherwise would belong to British subjects, and which had been purchased by the crown, at the expense of keeping up this sort of alliance. Secondly, That the Barbary states complained, that, adhering to the rule of fitting the other part of the indenture to the passes, they were obliged to suffer ships to pass that did not belong to British subjects. By stat. 4 Geo. 2. c. 18. it is made felony, without benefit of clergy, to forge, counterfeit, or alter Mediterranean passes; and such offences committed out of the kingdom may be prosecuted in any country.

FORM OF A MEDITERRANEAN PASS, as prescribed by an order of council dated 28th August, 1776.

By the commissioners for executing the office of lord high admiral of Great Britain and of Ireland, and of all his majesty's plantations

Suffer the ship _____ to pass with her company, passengers, goods, and merchandise, without any let, hinderance, seizure, or molestation, the said ship appearing to us by good testimony to belong to the subjects of his majesty, and to no foreigner.

Given under our hands and seals at the office of admiralty. (L. S.)

To all persons (L. S.)
whom these may concern. (L. S.)

By command of their lordships.

Form of a bond to be given at any of the ports of Great Britain or Ireland before a Mediterranean pass be delivered for any ship or vessel built in these kingdoms, or in any of his majesty's foreign governments or plantations, or for any foreign ship or vessel made free, and qualified to have such pass granted, as the same is prescribed by an order of council dated 28th August 1776.

Know all men by these presents, that we _____ are

holden and firmly bound to our sovereign Lord George the Third, by the grace of God, of Great Britain, France, and Ireland, king, defender of the faith, &c. in

pounds of good and lawful money of Great Britain, to be paid to our said lord the king, his heirs, and successors; to which certain payment well and truly to be made we bind ourselves, and each of us, for the whole, our, and each of our heirs, executors, and administrators, firmly by these presents.

Sealed with our seals, dated the day of in the year of the reign of our said lord the king, and in the year of our lord 18 .

The condition of this obligation is such, that whereas the above bounden hath received a pass, purporting to be a Mediterranean pass, signed by the right honourable the commissioners for executing the office of lord high admiral of Great Britain and so forth, for the called the

of whereof he the said is actually master, bearing date the .

Now if the said , or, in case of his death or inability, the person who shall succeed him as master of the said shall deliver into the admiralty office, upon her return from her present intended voyage into the port of London, or to the proper officers of the customs at any other port of great Britain or Ireland, where she shall come in order to her unloading; or in case the said shall not return to Great Britain or Ireland, within the term of three years from the date hereof, and during all that term shall remain, and be the property of his majesty's subjects, then if the master of the said for the time being, do, at the expiration of the said term of three years, deliver, or cause the said pass to be delivered, unto the governor or commander in chief of one of his majesty's foreign governments or plantations, or unto one of his majesty's consuls in the Mediterranean or elsewhere, in order to its being by such governor or commander in chief, or consul, returned and transmitted to the commissioners for executing the office of lord high admiral of Great Britain: and also, if the said master for the time being do and shall, when and as often as the said shall go into any foreign port or place, within the reach or district of any of his majesty's consuls, deliver, or cause the said pass to be delivered, unto such respective consul or consuls, or his or their deputy or deputies, upon his or their demanding the same in writing, in order to the said pass being retained in the possession of such respective consul or consuls, or his or their deputy or deputies, until the said shall have received the usual clearances, and be ready to depart from such port or place, at which time the said pass is to be returned for the use of the said ship: or in case the

said shall happen to be taken by an enemy or pirates, or be cast away and shipwrecked, by means whereof the said pass shall be inevitably lost or destroyed; then the above obligation to be void, and of none effect. But if the said master for the time being shall neglect to deliver, or cause the said pass to be delivered, into the admiralty office, upon her return from her present intended voyage into the port of London, or to the proper officers of the customs at any other port of Great Britain or Ireland, where she shall come within the said term of three years, in order to her unloading; or in case the said ship shall not return to England within the said term, then unto the governor or commander in chief of one of his majesty's foreign governments or plantations, or unto one of his majesty's consuls in the Mediterranean, or elsewhere, before the expiration of that term; or if the said master for the time being shall neglect or refuse to deliver the said pass to any of his majesty's consuls, or their deputies abroad, upon demand in writing being made thereof in manner above-mentioned (to prove which demand and refusal, or neglect, a certificate thereof in writing, under the hand of the respective consul, or his deputy, is to be deemed a sufficient evidence); or if the said pass shall be sold, lent, or otherwise disposed of, to any person whatsoever, so as that the same shall not be actually and constantly made use of for the service of the said called the for which it is granted, so long as the master thereof for the time being shall be a British subject; then the above obligation shall be and remain in full force, virtue, and effect.

There is some difference in the time for delivering up passes in different trades. Thus, for ships trading to the ports of France, Spain, and Portugal, on this side the Straights' mouth, the condition is for delivering up the pass within twelve months, either to the admiralty, or the custom-house officer at the port of unloading in Great Britain and Ireland.

In bonds given in the plantations, the condition is for delivering up the pass within twelve months to the governor of that plantation.

For ships in the East India trade, the condition is for delivering it up at the return from the voyage, without any limitation of time.

Passes for ships belonging to Gibraltar, are different from all others in the wording, and in the ornament at the top; and they are granted by the commissioners for executing the office of lord high admiral at that place. The condition of the bond given on obtaining such passes, is for delivering them up to such commissioners within twelve months, or at the end of the voyage, if the ship return sooner.

MEMORANDUM signifies, in general,

merely a note to assist memory; but its legal and mercantile significations are more extensive. Sometimes it means the substance of, and substitute for, a more formal instrument; as "a memorandum of an agreement:" sometimes the adjunct to, restriction or explanation of, the instrument to which it is affixed, or on which it is indorsed; as "a memorandum on a policy of insurance." In the last-mentioned sense, these memoranda have frequently become the intricate subjects of adjudications in our courts of law. It has been decided, that the memorandum upon a policy of insurance controuls the general words of the policy, so far as it extends. *Browning v. Elmsly*, 7 T. R. 216.

MERCER is a term well understood, but from use and habit only; for it is by no means what the lexicographers in general explain it to be; viz. "a seller of silk." It is sometimes confounded with *haberdasher*; but that application of it is little less incorrect; for a mercer is not a person who deals only in small articles of traffic, but who deals in small quantities of most articles of wearing apparel. It is something between the merchant who deals in gross, and the haberdasher of small wares; although the two callings are sometimes united in the same person, especially out of the metropolis.

MERCERIES are those articles in which the mercer deals, and are generally understood to mean the more considerable articles of wearing apparel, sold by retail.

MERCHANDISE, (GER. and DU. *Waaren*. DA. *Varer*. SW. *Varor*. FR. *Marchandise*. I. *It. Mercanzie*. SP. *Mercanzias*. PORT. *Mercancias*. RUS. *Towarü*. POL. *Towar*.) all sorts of goods which may be bought or sold. For enumerations of the species of merchandise which give rise to different branches of trade throughout the world, see EUROPE, ASIA, AFRICA, and AMERICA.

MERCHANT, is a wholesale dealer in all sorts of merchandise, who exports and imports from different parts of the world, deals in exchange, and buys and sells goods in their original packages, without breaking bulk.

The mercantile profession is very ancient, and generally esteemed noble and independent; in France, by two decrees of Lewis XIV. the one in 1669, and the other in 1701, a nobleman was allowed to trade both by land and sea, without any disparagement to his nobility; and we have frequent instances of merchants having been ennobled in that country, in regard of the utility their commerce has produced to the state. In many other places, more especially in the republics of Venice, Holland, and Genoa, the value of commerce has been justly appreciated; and in Great Britain there is not a higher or a more enviable character in the community, than that of an honourable, upright, intelligent merchant.

Merchant is so comprehensive a term, that it is impracticable to lay down any instructions that shall be universally applicable; nor is it within the scope of a book of this description to enter minutely into the *arcana* of each particular branch of trade; but there are some rules applicable to all mercantile pursuits, and others which are too prominently so in particular trades, of more than ordinary importance in this kingdom, that it would be improper to omit them.

Previously to a man's professing the title of a merchant, he ought to treasure up such a fund of useful knowledge, as may enable him to carry on, with ease to himself, an extensive commerce, without risking such losses and dis gusts, as ill-concerted undertakings of magnitude will naturally expose him to. To reduce this necessary science to a proper regulation, we shall recommend the following particulars to his acquirement.

1. A proper and correct style of writing, such as is best adapted to epistolary correspondence.
2. A thorough knowledge of arithmetic and book-keeping.
3. An acquaintance with the order and forms of invoices, sales, policies of insurance, bills of exchange, &c.
4. A general idea of commercial geography, including a knowledge of the commodities which the different trading nations of the world furnish.
5. A knowledge of the weights, measures, and monies of every country on the face of the globe.
6. A thorough acquaintance with the routine of custom-house, and banking business.
7. A knowledge of the price and condition of freighting and insuring ships and merchandise; of the articles permitted or prohibited, as well entering, as going out of the kingdoms and states in different parts of the world; of mercantile terms, usages, and institutions: of the goodness, value, and distinctive qualities of all necessaries for the construction and repairs of shipping; of the wages commonly allowed to captains, officers, and sailors, and the manner also of engaging with them.
8. A merchant should be well acquainted with such of the European languages as are most in vogue: viz. the *Spanish*, which is used in Spain, Portugal, in many parts of the East, and on the coast of Africa, from the Canaries to the Cape of Good Hope; the *Italian*, understood on all the coasts of the Mediterranean, and in many parts of the Levant; the *German*, which is understood in almost all the northern countries; and the *French*, which may justly be denominated the universal language of modern times.

9, and lastly. The merchant ought above all things to acquire an easiness of manner, a suavity of address, and a gentlemanly deportment, without which the finest talents

and the most valuable mental acquirements, are oftentimes incapable of realising the brilliant expectations which they induce their possessor to form.

General Cautions in the Management of Trade and Commerce.

Trade must become more or less troublesome, in proportion as it is more or less extensive; hence merchants ought to appropriate different maxims and considerations for the conduct and management of their affairs. Those, for instance, who are engaged in the merchandise of our own manufactories, or confine their trade to the consumption of one city only, incur less risks, and carry on their business with more facility, than such as dispose of their goods, not only in the place of their residence, but also to dealers, or retailers, in other parts of the kingdom, or abroad.

Wherever, therefore, any considerable manufactories are established, there are also generally merchants who supply them with the necessary materials for their works, which the latter dispose of, and in payment take the manufactured goods, which they afterwards dispatch in other places, or on the spot, in order to supply commissions given them. Some artificers, indeed, are sufficiently opulent to procure the ingredients they want for the supply of their manufactories from the first hands; yet there are others, whose capital being less extensive, are obliged to sell their goods to the first that may enquire for them.

Merchants, then, must regulate themselves in their dealings with these three classes of men, as times and seasons shall dictate; for when particular commodities are scarce, and in request, they must buy of all upon the best terms possible, and in proportion to the advantages that may present themselves. On the contrary, when commerce stagnates, and a large stock of goods is lying on hand, it will be necessary to act with circumspection, and the observance of the following maxims in their purchases, may, in such cases, essentially promote their interests.

1. When the price of goods is beginning to rise (which usually proceeds either from the value of the materials being considerably augmented on account of their scarcity, or the stock of manufactured articles being inadequate to supply a brisk demand), it is natural for such as are complete to increase in value, in proportion to their want and scarcity; but it would be prudent in him who would buy under such circumstances, to examine the causes that produce this augmentation; and if (for instance) the goods are of silk, to enquire whether the crop of that commodity has been good or bad, (though if the season has been moist and rainy at the place of its growth, he may be assured of the latter) and that the scarcity

of the merchandise proceeds from a deficient supply of the principal material.

The same remark will apply to the manufactories of cloth, and other woollens, when wools are scarce and risen in price; and also to linens, where the crops of hemp and flax have failed: and indeed it is applicable to every kind of material, which compose the manufactures of the different sorts of merchandises, because (as already intimated) the scarcity of these augments their price, and consequently that of the commodities, in the manufacture of which they are consumed.

Where, indeed, the augmented price of merchandise proceeds from a scarcity of the materials, it not only must continue in that state for a long time, but also it daily and gradually rises, and in this case affords to the merchant no room for deliberation; who ought immediately to purchase and to make his bargain, to receive, however, at a subsequent certain time the quantity he judges he may have occasion to vend.

If the rise of goods be produced by there being few in the market, and a great demand for them, and not by a want of the materials which compose them, the buyers ought to act with deliberation in their purchase; as it is highly probable that this augmentation will only be temporary: for, when manufacturers find their commodities in growing request, they engage more deeply in the manufacture; and the consequent abundance occasions a cheapness, in the same manner as a scarcity before produced the reverse. It is peculiarly necessary to attend to these considerations, in order to make successful purchases.

2. The second maxim necessary to be observed in the buying of merchandise is, that the trader be extremely circumspect in his language, in order that his anxiety to have the goods he is treating for may not appear. Nor should he slight or undervalue them, in order to be thought not to want them, as this cunning only serves to embarrass the mind of the manufacturer, and make him more firm and tenacious under the uncertainty, whether this be a feint or not. The correct, as well as most prudent, way, is to act with sincerity and frankness, accompanied, however, with prudence. Workmen prefer to deal with characters of this description, rather than with those who resort to mean and petty subterfuges.

3. A third object of consideration is, whether the merchandise has diminished in price from a higher degree to which it had before attained, or whether it augmented in price from a lower one, at which it was, by reason of a dulness in trade, or by the previous too great abundance of the manufactured article. This will call forth all the judgment and skill of the purchasers.

If it be at the height of its dearness, and should afterwards fall, it will in this

case be improper to buy, because it is certain, that if the cause, which had produced so high a price, ceases, it will daily diminish, till it returns to the point of its just value. On the contrary, if the goods are at their lowest value, and the price begins to rise, it is then a time to buy, because it is certain that it will daily augment, so long as the cause which gave room for its augmentation shall continue. These hints will not appear paradoxical to those who have had much experience, for many merchants have greatly lost or gained, according as they have opportunely taken their measures, in conformity with these rules.

4. The fourth maxim in the purchase of goods, is both to know and reflect, where they will meet the best sales, and then to suit their quality to the taste of the inhabitants.

5. The fifth is to buy of the poorest workmen; because they not having the means to lay up their manufactures, must sell cheaper than those will who are more powerful and opulent, and who can keep their goods till a fit opportunity offers for a more advantageous sale.

6. The sixth maxim is, not to be drawn in to engage beyond your capital by the tempting bait of a cheap purchase, and from a wrong calculation of your ability to pay at the time agreed on; as a failure of punctuality herein will occasion a loss of credit among the manufacturers, not to be recovered. To a neglect of this important point, perhaps most of the bankruptcies may be attributed which fill the columns of our daily newspapers.

7. The seventh maxim is not to employ, as factors at the fabrics, any individuals who act as merchants, and sell the materials to the manufacturers: for they always buy the goods dearer than others who have nothing to sell, because they give a part in payment, and very often, to recover from their debtors, they take of them merchandises in payment, which are neither so good, nor handsome, as those bought with ready money.

Lastly, Where the buyer has a partner, one of them should be on the spot for two reasons: first, because being interested in the trade, he is more diligent, and takes better care of what he does, than a factor, who often regards nothing more than his own interest, and who, having commissions from several merchants, favours whomsoever he pleases: secondly, because affairs are transacted more secretly, and frequently opportunities offer for good purchases, which one commissioned does not dare to engage in, though on such adventures large profits are frequently to be made.

These maxims are also strictly applicable in the purchase of all other commodities; and if carefully attended to, will lead the merchant in the steps he ought to tread, so as to secure success: it only remains now to

offer a few suggestions to aid him in the proper conducting of his sales.

1. The merchant should avoid many words, and much circumlocution in his dealings; such conduct having the appearance of a petty chapman, or retailer, rather than that of a merchant. The principal object of attention, therefore, in sales on trust, is, that his debtor be one known for his punctuality and honesty, and also for dispatching large quantities of goods, as these motives should induce a preference to be given to one so qualified, (though with less profit,) rather than to another with inferior credit, and a more contracted trade.

2. If the merchandises dealt in are such as are dependent, in some sort, for their value, on the caprices of fashion, the seasons ought to be consulted for advantageous sales; so that, if those proper for the winter are in request towards its close, it is not reasonable to expect so much at that time as in the beginning; neither is it consistent with the owner's interest to keep them, as he may have no other offers till the returning year, and he then risks their continuance in fashion; so that it will be prudent to embrace any tolerable offer under these circumstances that is made to him.

3. The merchant ought not to trust too much to any one person: for in the event of a failure, it may straiten him, and in the end bring him to the same misfortune. Prudence, therefore, will direct him to disperse his effects into many hands; so that, if one or two miscarry, he may be less sensible of his loss, and better able to support it: this is a very necessary maxim to be observed by those who have large dealings, as the sufferings by contrary practice are innumerable, and there is no one article of misconduct that has involved more in ruin.

4. A merchant should not inconsiderately engage with young men, who have little more to recommend them to credit, than their descent from opulent parents, as a credit trust on this account is the product of a very false maxim; because if they do otherwise than well, their parents will seldom pay their debts (as the creditor may have fondly flattered himself): neither is it reasonable to expect it, any more than to think they should incommode themselves, or injure the fortunes of their other children, merely to support a son who may have been reduced by gaming, or other imprudence.

5. Should it happen that debtors omit to pay what they owe, at the times agreed on, nothing is more unworthy, as well as imprudent, than for the creditors to oppress them with an extravagant interest: for though necessity may apparently oblige them to submit, it is a sure canker to their fortunes, which too often at last involves both the debtor and the creditor in ruin. These strictures may perhaps be thought irrelevant in a country where the wisdom of

the legislature has effected all that is practicable to prevent oppressive and usurious contracts : but we know how frequently are these salutary regulations completely frustrated by the evasive arts of designing and depraved characters.

6. Never lend to any persons on an unjustifiable security ; for although it is both reasonable and prudent for a merchant to take pledges or securities from his debtors, he should be cautious of what they consist : for instance, if they are composed of merchandise, their colours, fashions, &c. may change, or the quality may suffer by keeping, so that while he imagines he has the value of what is owing him in hand, he may be very essentially mistaken. And in these cases of lending or selling, on trust, and taking pledges instead of notes for security, the seller or lender should add to the above precaution, that of making the terms of the deposit very clear and apparent, in case of a failure of the debtor, and a consequential claim of the goods by the other creditors, as a joint property ; otherwise he may be accused of endeavouring to secrete the bankrupt's effects ; and if he has not adopted those prudent steps which he ought to have taken in his dealings, he may be obliged to give up what he received and esteemed as a security, besides suffering in his reputation, from his inability to justify what he asserted and pretended. It will therefore be very proper to have all such affairs transacted in the presence of witnesses, or at least to have all the goods that are pledged, particularly specified in the note or obligation given for the trust or loan, by which means the inconveniences above-mentioned will be effectually obviated or avoided.

7. A merchant should always endeavour to dispose of such goods as are decaying, damaged, or growing unfashionable, as soon as he conveniently can ; and if money cannot be procured for them, he should barter them for other goods, on the best terms possible ; taking, however, every necessary precaution already noticed, as in the original purchase of goods, and further avoiding the paying any ready money in the transaction ; for, in dealings of this description, the receiver will derive the chief advantage. As deceits are very commonly practised in these sorts of negotiations, he ought to know where, and on what terms, he can get rid of his new effects, otherwise he may risk losing more by them than his old ones. But above all, he should avoid giving any share of ready money in the bargain, if possible, as he that parts with it is sure to have less advantage in these uncertain dealings, than he that receives it.

8. Lastly, a merchant should never sell any of his goods in small parcels, unless the most absolute necessity require it : such a conduct derogates from his character, and will, on the whole, occasion him a loss of respectable customers.

These may perhaps appear to inexperienced persons obvious, as well as trite and homely, maxims ; but to the non-observance of some, or all, of them, most of the failures which are continually occurring are to be traced. It is presumed therefore that they are not superfluous, or inopportune.

MERCHANTABLE COMMODITIES, are goods in their perfect state, free of mixture, or damage, of any ways injured in quantity or quality.

MERCHANTMAN, a ship or vessel employed in a merchant's service. *See SHIP.*

MERCURY. (GER. *Quicksilber*. DU. *Kwiksilver*. DA. *Qveksilv*. SW. *Quicksilver*. FR. *Argent vif*, *Mercure*. IT. *Argento vivo*, *Mercurio*. SP. *Azogue*, *Mercurio*. PORT. *Azougue*, *Mercurio*. RUS. *Rtut*. POL. *Zywe srebro*, *Rtec*, *Frtec*. LAT. *Hydrargyrum*, *Argentum vivum*, *Mercurius*.) Mercury is a metallic substance, fluid at the common temperature, having the appearance and brilliancy of melted silver ; its specific gravity is 13.568. It becomes solid at 39° below zero of Fahrenheit, and is then malleable. It is volatile at 600°. It combines with all the other metals, except iron ; and the combinations are termed *amalgams*, to distinguish them from the compounds resulting from the combinations of the other metals with each other, which are called *alloys*.

Mercury is found in Spain, in various parts of Germany, in China, and in great abundance in South America. It is sometimes found in a fluid, metallic state ; but most frequently in combination with sulphur, termed *cinnabar*. It is also found amalgamated with various metals.

Mercury is used in various forms in several of the arts. An amalgam with tin is employed in silvering the backs of glass mirrors ; and the amalgam of zinc is the best preparation for promoting the excitement of electrical machines. An artificial combination of mercury with sulphur, forms the beautiful pigment called *vermilion*. Its uses in medicine are various, and of the highest importance.

METALS, are a class of bodies distinguished by the following characters :—brilliancy, colour, opacity, density, hardness, elasticity, ductility, malleability, tenacity, fusibility, power of conducting caloric, and electricity.

Metals were formerly divided into *noble* or *perfect*, and *imperfect metals*. The perfect metals were platina, gold, silver, mercury ; and the property on which this character was founded, was that of their being susceptible of being reduced from the state of oxide by exposure to heat. The other metals were called *imperfect*, because, to reduce them to the metallic state, the addition of some combustible body was necessary.

They were also divided into *metals* and *semi-metals*. Among the former were included, those which were malleable and ductile; the latter comprehended those which possessed neither of those properties. The classification now generally adopted is founded on the principle of their relative attraction for oxygen. They may thus be arranged under five heads.

The *first* embraces those which neither absorb oxygen, nor decompose water, at any temperature; their oxides are reducible at a heat below redness. Those are gold, silver, platinum, palladium, rhodium, iridium.

The *second*, those which, when heated to a certain temperature, absorb and retain oxygen, and, at a higher temperature, they again give it off: those are osmium, mercury, lead, nickel.

The *third* absorb oxygen even when at a temperature above redness: they are incapable of decomposing water at any temperature; such are, arsenic, molybdenum, chrome, tungsten, columbium, antimony, manium, cerium, cobalt, titanium, bismuth, copper, tellurium, and selenium.

The *fourth*, are those which absorb oxygen even at a high temperature; and when heated to redness are capable of decomposing water. Those are iron, tin, zinc, manganese.

The *fifth* absorb oxygen, and rapidly decompose water at all temperatures; as potassium, sodium, barium, strontium, calcium, magnesium.

A *sixth* class may be formed of those substances, which by analogy are considered metallic, but of which the oxides have not hitherto been reduced; those are silicium, aluminum, zirconium, itrium, and glucium.

Metals are found in the clefts of rocky strata, in veins, or in indeterminate masses in beds, or interspersed throughout other substances. They are either *native*, or in a pure metallic state; *alloyed*, being in combination with each other, in the form of a *calx*, or oxide; or in combination with sulphur; or in the state of crystals, as when united to acids. The different processes employed for obtaining metals in their pure form, are *pounding*, *washing*, *roasting*, *amalgamation*, *reduction*, and *refinement*.

METHEGLIN. See MEAD.

MEZZOTINTO, a kind of graving, so named, as nearly resembling paint, the word importing half-painted. See ENGRAVING.

MICA. This stone forms an essential part of many mountains, and has been long known under the name of *glacies Mariae*, and (improperly) under that of Muscovy glass. It consists of a great number of thin laminae adhering to each other, sometimes of a very large size. Specimens have been found in Siberia nearly $2\frac{1}{2}$ yards square. It is sometimes crystallised; and is frequently found in plates or scales of no determinable figure or size. Its colour, when purest, is

silver white or grey, but it occurs also yellow, greenish, reddish, brown, and black. Mica is fusible by the blow-pipe into a white, grey, green, or black enamel; and this last is attracted by the magnet. Spanish wax rubbed with it becomes negatively electric.

Mica has long been employed as a substitute for glass. A great quantity of it is said to be used in the Russian marine for panes to the cabin-windows of ships; it is preferred, because it is not so liable as glass to be broken by the agitation of the ship. It is also used in our navy for lanterns, for the use of the powder-rooms.

The white and yellow micas when reduced to powder, are used to sand writing, by the name of gold or silver sand.

MICHAELMAS. The feast of St. Michael the arch-angel, kept on the 29th day of September, is one of the four quarter-days into which the year is divided, is that from which especially demises of land take place throughout the country, and on which the rents arising from all species of property generally become due and payable. It regulates the commencement of one of the law-terms, and several of the great fairs throughout the kingdom, particularly those for the sale of cheese, and hops.

MIDSHIP is a term of distinction applied by shipwrights to several pieces of timber, which lie on the broadest part of the vessel.

MIDSHIPMEN, officers on board a ship, whose station, when on duty, is on the quarter-deck, the poop, &c.

They are to mind the braces, pass the word of command from the captain, and other superior officers, and sometimes assist in navigating the ship, stowing, rummaging, &c. The number of midshipmen is always in a certain proportion to the size of the ship. A first-rate man of war has 24, and all the ships of inferior size in proportion. No person can be appointed lieutenant who has not previously served two years in the royal navy as a midshipman, or as a mate, beside having been at sea at least four years in actual service.

MIDSUMMER-DAY is the 24th day of June, the feast of St. John the Baptist. It is one of the four quarter-days of the year, on which rents become payable, &c. &c.

MILE, the usual measure of roads in England, being 8 furlongs, or 1760 yards. See WEIGHTS and MEASURES.

MILITIA, *British*, presents an article which ought not to be omitted even in a Commercial Dictionary, since the obligations connected with it attach universally to mercantile men, without any of those exemptions which are, at least, partially extended to persons in most of the other walks of life. The model on which the present militia system was erected, had its origin in certain statutes passed immediately

after the restoration of Charles II., for raising and equipping, what were then denominated "trained bands," in the different counties of the kingdom. The substance of such of those provisions as were found beneficial, were engrafted, with many new regulations, into the present scheme of a militia, within the first few years of the present reign; viz. by statutes 2 Geo. 3. c. 20. and 9 Geo. 3. c. 42. The enactments of these two statutes have been altered, modified, and amended, by a great variety of successive ones, as dictated by progressive emergencies. The 42 Geo. 3. c. 90. is that by which the *old established* militia force is now principally governed, (with some few amendments by subsequent statutes, especially by 43 Geo. 3. c. 50.; 56 Geo. 3. c. 64., and 57 Geo. 3. c. 57. For all which, and the general effect of them, see 2 and 3 *Dick. Pract. Expos. title, MILITIA*.) By virtue of the system established under these acts, every male in the kingdom between the ages of 18 and 45, with the exception of those who are specifically exempted, are rendered liable to serve in the militia, either in person, or by substitute. The persons exempted are peers, officers in the army and navy, resident members of the universities, clergymen of the establishment, licensed teachers not of the establishment, peace-officers, articulated clerks, and apprentices; persons serving in other military capacities, in the navy, dock-yards, forts, wharfs, powder-mills, magazines, and storehouses belonging to His Majesty; persons free of the watermen's company; and *poor men* having more than one child born in wedlock.

By a statute of 48 Geo. 3. amended by several subsequent ones, and especially 52 Geo. 3. c. 53., (2 and 3 *Dick. Pract. Expos. title, MILITIA, Local*.) a new species of internal military force was directed to be raised, under the denomination of *Local Militia*, in contradistinction to that, the laws of which we have been epitomising, and which now took the name of the *old militia*.

The scheme of this more recent military establishment is as comprehensive as that of its predecessor, with respect to the general description of persons whom it embraces, the exemptions being at the same time nearly similar.

The only observations on these laws which appear necessary to be added here, are, that the obligation imposed by the *old militia* system partakes of a pecuniary, as much as of a personal, complexion; inasmuch as the individuals on whom the burden of serving may fall by the ballot directed, may execute the duty by deputy, having the liberty of finding substitutes respectively, on such terms as they can obtain them. But in the *Local Militia*, by (sect. 35. of) the before mentioned 52 Geo. 3. c. 53., substitutes are specifically prohibited under the alternative punishment of fine, or imprisonment, with

additional service, and a prohibition against insurance or other method of contributing toward the payment of such fines, under a penalty of 50*l*.

MILK is a fluid secreted by the female of all those animals denominated mammalia, and intended evidently for the nourishment of her offspring.

The milk of every animal has certain peculiarities which distinguish it from every other milk. But the animal whose milk is most made use of by man as an article of food, and with which, consequently, we are best acquainted, is the cow.

It seems scarcely to claim insertion as an article of domestic commerce, and yet it may be difficult to assign a reason why it should not. Suffice it, however, to observe, that it is calculated, that there is a consumption of somewhat more than 60,000,000 of quarts annually, in the metropolis only, of cows' milk, or what passes for it.

Asses' milk is also not an unprofitable article of consumption; and the demand for it increases with the advance of luxury, late hours, crowded rooms, and thin clothing.

The use of skimmed, or blue, milk has become an essential article in wine-coopering science. It is adapted to the clarifying of spirits, and white wines, and to the discharging, or rather carrying off, the colour of such red wines as have been manufactured from white grapes, and coloured by artificial means.

MILL is a term now applied to all edifices enclosing machines whose action depends on a circular motion, at least in colloquial language. This, however, is rather a metaphorical, than a logical application of the term; for it was originally confined to those machines alone by which corn is ground. Mills, in the enlarged sense of the word, however, are now protected by numerous statutes, which we will first advert to, and afterwards enumerate those which apply to each particular description of mill, as the consideration of them respectively occurs. By 9 Geo. 3. c. 29., if any person shall unlawfully, riotously, and tumultuously, and with force, demolish or pull down, or begin to demolish and pull down any wind saw-mill, or other mill, or any water-mill, or other mill, or any works thereto belonging; or engines belonging to mines, or waggon-ways, or fences, by act of parliament, they shall be guilty of felony, *sans* clergy.

By 41 Geo. 3. c. 24. damages for the same shall be recoverable against the hundred, according to rules prescribed by 1 Geo. 1. c. 5. By 43 Geo. 3. c. 58. burning mills in order to defraud third persons, is made also felony *sans* clergy. — Lastly, by 52 Geo. 3. c. 130. the provisions of these former acts are extended to all erections, buildings, or engines, used or employed in any trade, manufactory, or branch thereof. See further, *title MINES, and title ENGINES*.

We now come to consider, first, the construction of mills generally; secondly, the purposes to which mills are applied.

There are several constructions of mills, according to the various modes of applying the moving power, as water-mills, wind-mills, &c.

In water-mills, the momentum of the water is the moving power; and the attrition of the two stones in grinding is the force to be overcome. Of these mills there are two kinds, viz. those where the force of the water is applied above the wheel, and those where it is applied before the wheel; the former being called overshot, and the latter undershot mills; and to these we may add a breast-mill, where the water strikes against the middle of the wheel.

Few people are ignorant that corn is ground by two mill-stones, placed one above the other, without touching. The lower, or nether mill-stone is immoveable; but the upper one turns upon a spindle. The opposite surfaces of the two stones, which act to grind the corn, are not plane or flat; but the upper one is hollow, and the under one swells upwards; each of them being of a conic figure, whose axis indeed is very short in proportion to the diameter of its base; for the upper one, being six feet in diameter, is hollowed but about one inch at its centre, and the lower one rises but about three-fourths of an inch. These two mill-stones come nearer and nearer towards their circumference, whereby the corn that falls from the hopper has room to insinuate itself between them as far as two-thirds of the radius, which is the place where it begins to be ground, and where it makes the greatest resistance that it is capable of; the space between the stones being in that place but about two-thirds or three-fourths of the thickness of a grain of corn. But as the millers have the means of raising or sinking the upper stone a little, they can proportion its distance from the lower one, according as they would have the flour finer or coarser.

The circular motion of the upper mill-stone brings the corn out of the hopper by jerks, and causes it to recede from the centre towards the circumference; where being quite reduced to flour, it is thrown out of the mill by the centrifugal force of the stone, through a hole provided on purpose.

As the water acts upon an overshot-mill both by impulse and weight, so does it likewise upon a breast-mill, or that where the water comes upon the breast or middle part of the wheel: and here, though the weight of the water is not so great as in the overshot-mill, being contained in the buckets of the lower quarter only; yet the impulse of the water is much greater, the height of the water being increased nearly the semi-diameter of the great wheel, all other things being equal. If the height of the water remains

the same, the aperture of the penstock, or flood-gate, must be enlarged to nearly twice the area, that the force may be the same; so that to produce the same effect, twice as much water is necessary for a breast-mill as for an overshot one, every thing else being the same.

As to the undershot-mill, it is evident that there can be only the impulse from the water; and therefore the height of the water remaining the same, there must be a larger aperture of the penstock for the discharge of a greater quantity of water in the same time, in order to produce the same effect, as in the overshot or breast-mill: whence a greater expense of water will be made here than in any other mill, and can only be supplied for a constancy by a river; and where this can be had, the undershot is the easiest, cheapest, and most simple structure a mill is capable of.

Mr. Smeaton has considered the best methods of constructing all these mills from machines and models made on purpose; but, conscious of the inferiority of models to practice, did not venture to give his opinion without having seen them actually tried, and the truth of his doctrines established by experience.

Having described the machines and models used for making his experiments, he observes, that, with regard to power, it is most properly measured by the raising of a weight; or, in other words, if the weight raised is multiplied by the height to which it can be raised in a given time, the product is the measure of the power raising it; and, of consequence, all those powers are equal, whose products made by such multiplication are equal: for if a power can raise twice the weight to the same height, or the same weight to twice the height, in the same time that another can, the former power will be double the latter; but if a power can only raise half the weight to double the height, or double the weight to half the height, in the same time that another can, the two powers are equal. This, however, must be understood only of a slow and equable motion, without acceleration or retardation; for, if the velocity is either very quickly accelerated, or retarded, the *vis inertia*, in our author's opinion, will produce an irregularity.

To compute the effects of water-wheels exactly, it is necessary to know, in the first place, what is the real velocity of the water which impinges on the wheel. Secondly, the quantity of water expended in a given time; and, thirdly, how much of the power is lost by the friction of the machinery.

1. With regard to the velocity of the water, Mr. Smeaton determined by experiments with machinery, that with a head of water 15 inches in height, the velocity of the wheel is 8.96 feet in a minute. The

area of the head being 105.8 inches; this multiplied by the weight of a cubic inch of water, equal to .579 of an ounce avoirdupoise, gives 61.26 ounces for the weight of as much water as is contained in the head upon one inch in depth; and by further calculations, derived from the machinery made use of, he computes that 264.7 pounds of water descend in a minute through the space of 15 inches. The power of the water, therefore, to produce mechanical effects in this case, will be 264.7×15 , or 3970. From the result of the experiment, however, it appeared that a vast quantity of the power was lost; the effect being only to raise 9.375 pounds to the height of 135 inches: so that the power was to the effect as 3970 to $9.375 \times 135 = 1266$, or as 10 to 5.18.

This, according to our author, must be considered as the greatest single effect of water upon an undershot-wheel, where the water descends from a height of 15 inches; but as the force of the current is not by any means exhausted, we must consider the true proportion betwixt the power and effect to be that betwixt the quantity of water already mentioned, and the sum of all the effects producible from it. This remainder of power, it is plain, must be equal to that of the velocity of the wheel itself multiplied into the weight of the water. In the present experiment, the circumference of the wheel moved with the velocity of 3.123 feet in a second, which answers to a head of 1.82 inches; and this height being multiplied by 264.7, the quantity of water expended in a minute, gives 481 for the power of the water after it has passed the wheel; and hence the true proportion betwixt the power and the effect will be as 3849 to 1266; or as 11 to 4.

As the wheel revolved 86 times in a minute, the velocity of the water must be equal to 86 circumferences of the wheel; which, according to the dimensions of the apparatus used by Mr. Smeaton, was as 86 to 30, or as 20 to 7. The greatest load with which the wheel would move was 9 lb. 6 oz. and by 12 lb. it was entirely stopped. Whence our author concludes, that the impulse of the water is more than double of what it ought to be according to theory; but this he accounts for by observing, that in his experiment the wheel was placed not in an open river, where the natural current after it has communicated its impulse to the float, has room on all sides to escape, as the theory supposes, but in conduit, to which the float being adapted, the water cannot otherwise escape than by moving along with the wheel. It is observable that a wheel working in this manner, as soon as the water meets the float, receiving a sudden check, it rises up against the float like a wave against a fixed object; insomuch that, when the sheet of water is not a quarter of an inch thick before the float, yet this sheet will act

upon the whole surface of a float whose height is three inches; and, consequently, was the float no higher than the thickness of the sheet of water, as the theory also supposes, a great part of the force would have been lost by the water dashing over the float.

Mr. Smeaton next proceeds to give tables of the velocities of wheels with different heights of water; and from the whole deduces the following conclusions: 1. The virtual or effective head being the same, the effect will be nearly as the quantity of water expended. 2. The expense of water being the same, the effect will be nearly as the height of the virtual, or effective head. 3. The quantity of water expended being the same, the effect is nearly as the square of the velocity. 4. The aperture being the same, the effect will be nearly as the cube of the velocity of the water. Hence, if water passes out of an aperture in the same section, but with different velocities, the expense will be proportional to the velocity; and, therefore, if the expense is not proportional to the velocity, the section of the water is not the same. 5. The virtual head, or that from which we are to calculate the power, bears no proportion to the head-water; but when the aperture is larger, or the velocity of the water less, they approach nearer to a coincidence; and, consequently, in the large openings of mills and sluices, where great quantities of water are discharged from moderate heads, the head of water and virtual head determined from the velocity, will nearly agree; which is also confirmed by experience. 6. The most general proportion betwixt the power and effect is that of 10 to 3; the extremes 10 to 3.2, and 10 to 2.8. But it is observable, that where the power is greatest, the second term of the ratio is greatest also; hence we may allow the proportion subsisting in great works to be as three to one. 7. The proportion of velocity between the water and wheel is, in general, about five to two. 8. There is no certain ratio between the load that the wheel will carry as its proper maximum, and what will totally stop it; though the proportions are contained within the limits of 20 to 19, and 20 to 15; but as the effect approaches nearest to the ratio of 20 to 15, or of 4 to 3, when the power is greatest, either by increase of velocity, or quantity of water, this seems to be the most applicable to large works; but as the load that a wheel ought to have, in order to work to the best advantage, can be assigned by knowing the effect that it ought to produce, and the velocity it ought to have in producing it, the exact knowledge of the greatest load it will bear is of little consequence in practice.

Practical rules for the construction of mills.

—1. Measure the perpendicular height of the fall of water, in feet, above that part of the wheel on which the water begins to act, and call that the height of the fall.

2. Multiply this constant number 64.2882 by the height of the fall in feet, and the square root of the product will be the velocity of the water at the bottom of the fall, or the number of feet that the water there moves per second.

3. Divide the velocity of the water by three, and the quotient will be the velocity of the float-boards of the wheel, or the number of feet they must each go through in a second, when the water acts upon them so as to have the greatest power to turn the mill.

4. Divide the circumference of the wheel in feet by the velocity of its floats in feet per second, and the quotient will be the number of seconds in which the wheel turns round.

5. By this last number of seconds divide

60, and the quotient will be the number of turns of the wheel in a minute.

6. Divide 120 (the number of revolutions a mill-stone four feet and a half diameter ought to have in a minute) by the number of turns of the wheel in a minute, and the quotient will be the number of turns the mill-stone ought to have for one turn of the wheel.

7. Then, as the number of turns of the wheel in a minute, is to the number of turns of the mill-stone in a minute, so must the number of staves in the trundle be to the number of cogs in the wheel, in the nearest whole numbers that can be found.

By these rules, the following table is calculated to a water-wheel 18 feet diameter, which may be a good size in general.

THE MILL-WRIGHT'S TABLE.

Height of the fall of water.	Velocity of the fall of water per second.	Velocity of the wheel per second.	Revolutions of the wheel per minute.	Revolutions of the mill-stone for one of the wheels.	Cogs in the wheel, and staves in the trundle.		Revolutions of the mill-stone per minute, by these staves and cogs.
Feet.	Feet. 100 parts of a foot.	Feet. 100 parts of a foot.	Revolutions. 100 parts of a rev.	Revolutions. 100 parts of a rev.	Cogs.	Staves.	Revolutions. 100 parts of a rev.
1	8.02	2.67	2.83	42.40	254	6	119.84
2	11.34	3.78	4.00	50.00	210	7	120.00

1	2	3	4	5	6	7	

To construct a mill by this table, find the height of the fall of water in the first column, and against that height, in the sixth column, you have the number of cogs in the wheel, and staves in the trundle, for causing the mill-stone, four feet six inches diameter, to make about 120 revolutions in a minute, as near as possible, when the wheel goes with one-third part of the velocity of the

water. And it appears by the 7th column, that the number of cogs in the wheel, and staves in the trundle, are so near the truth for the required purpose, that the least number of revolutions of the mill-stone in a minute is 118, and the greatest number never exceeds 121; which is according to the speed of some of the best mills.

One of the most useful communications of

motion in machinery, is by means of toothed wheels acting on each other. It is of the greatest consequence to have the teeth so formed, that the pressure by which one of them urges the other round its axis is constantly the same. This is by no means the case when the common construction of a spur-wheel, acting in the cylindrical staves of a lantern, or trundle, is used. The ends of teeth should never be formed of parts of circles, but of a particular curve, called the epicycloid, which is formed by moving the circle, called the generating circle, round the circumference of another circle, while it turns also round its own centre; then any point will describe an epicycloid.

Emerson observes, that the teeth of wheels ought not to act upon each other before they arrive at the line which join their centres; and though the inner or under sides of the teeth may be of any form, yet it is better to make both sides alike, which will serve to make the wheel turn backwards. The more teeth that work together the better; at least one tooth should always begin before the other has done working. The teeth ought to be so disposed, as not to trouble or hinder one another before they begin to work.

If the cogs of a wheel and rounds of a trundle could be put in as exactly as the teeth are cut in the wheels and pinions of a clock, then the trundle might divide the wheel exactly, that is to say, the trundle might make a given number of revolutions for one of the wheel, without a fraction. But as any exact number is not necessary in mill-work, and the cogs and rounds cannot be set in so truly as to make all the intervals between them equal, a skilful millwright will always give the wheel what he calls a hunting-cog; that is, one more than what will answer to an exact division of the wheel by the trundle. And then, as every cog comes to the trundle, it will take the next staff, or round, behind the one which it took in the former revolution; and by that means will wear all the parts of the cogs and rounds which work upon one another equally, and to equal distances from one another, in a little time.

MILLS, Corn, as being of the most general importance. By 36 Geo. 3. c. 85. every person keeping a mill for grinding corn, shall have in such mill a true balance, with proper weights; and any persons legally appointed to examine weights and measures, may examine the same, and in default thereof, such miller shall forfeit 20s. Millers shall weigh the corn brought to be ground, if required, and also again after it is ground, and on refusal so to do, shall forfeit 40s.; and shall also return the whole weight (making certain reasonable allowances for waste, &c.) and instead of taking toll of the same, shall accept a money payment, if required, under a penalty of 5*l.*; and further, shall put up in some conspicuous

place in the mills; a table of their prices in money; and also of the toll or multure which they demand respectively for grinding, under a penalty of 20s. for every offence against these provisions.

MILLS, Cotton and Woollen. The 42 Geo. 3. c. 73. regulates the management and employment of poor apprentices in mills of these descriptions, and in manufactories. It directs that every such edifice shall, at least twice in every year, be white-washed throughout with quick-lime and water, and that the apartments shall be sufficiently ventilated. It then regulates the mode of clothing, and the hours of working the apprentices; the instructing them in reading and writing, &c.; the attending to them on Sundays; the obtaining medical assistance for them in sickness; it directs the appointment of visitors, and inflicts penalties on the masters or managers of these establishments misbehaving.

MILLS, Bark, like most other mills, are worked sometimes by means of horses, at others by water, and at others by wind. One of the best mills we have seen described for these purposes is that invented by Mr. Bagnall, of Worsley, in Lancashire: this machine will serve not only to chop bark, to grind, to riddle, and pound it, but to beam or work green hides and skins out of the mastering, or drench, and make them ready for the ouse, or bark liquor; to beam sheepskins and other skins for the skinner's use; and to scour and take off the bloom from tanned leather when in a currying state.

MILL, Foot, is a mill for grinding corn or any other substance, moved by the pressure of the feet of men, or beasts. In some foot-mills a horse or an ox is fixed to a stall upon a floor above a vertical wheel; and a hole is made in the floor, in the place where the hind feet of the animal should stand; thus admitting those feet to press upon the run of a wheel, and cause the wheel to turn upon its axle, and give motion to the whole mill.

MILL, Hand, or HORSE-MILL, is that worked by the hand, or by horses, &c. There is a long beam or lever for moving it, so attached that it may receive many men or horses, to drive several mills at once. There is the cog-wheel, placed horizontally, with pins fixed, not on its plane, but on the outside, at the circumference of the joints. There are also the trundle-head, the support, the iron axis, and the drum, where the mill-stones are inclosed.

MILL, Fulling, a machine moved by water, which raises, and lets fall, large wooden pistons in peals or troughs, in order to full and scower woollen stuffs. See **FULLING**.

MILL, Forge, a machine turned by water, which works one or more huge hammers, to beat or hammer iron into bars, anchors, and other massive works.

MILL, *Gunpowder*, is that used to pound and beat together the ingredients whereof gunpowder is composed.

MILL, *Sawing*, is a machine turned by water, which saws several planks or boards at the same time. See SAWING-MILL.

MILL, *Sugar*, serves to bruise the sugar canes, and express the juice or liquor contained in them. See SUGAR-MILL.

MILL, *Coiner's*. See COINAGE.

MILL-BOARDS, the thickest sort of pasteboard, usually employed by book-binders as covering for books.

MILL-COG, the denticulations on the circumference of the wheels, by which they lock into other wheels.

MILL-DAM, the mound by which the water is kept up to raise it for the mill.

MILLET. (GER. *Hirse*. DU. *Geerst*, *Geers*, *Gierst*. DA. *Hirse*. SW. *Hirs*. FR. *Millet*, *Mil*. IT. *Miglio*, *Panicastrolo*. SP. *Mijo*. PORT. *Milho*, *Painço*. RUS. *Proszo*. POL. *Proso*. LAT. *Milium*, *Panicum miliaceum*.) Millet is a native of India; but is now commonly cultivated in many parts of Europe, as an esculent grain. It rises with

a reddish stalk three or four feet high. The top of the stalk is terminated by a large loose panicle which hangs on one side, having a chaffy flower, which is succeeded by a small round seed. There are two varieties, one with white, and the other with black, seeds; but they do not differ in any other particular. This plant is greatly cultivated in the Oriental countries, whence it is annually brought to us. It is seldom cultivated in Britain, unless in small gardens. The species of millet which Linnæus denominates *holcus sorghum*, is cultivated in Malta, and in several parts of Italy, especially in Campania, or Compagna di Rana, where the inhabitants make it into a sort of bread, which has an uncommonly sweet flavour. This grain is, according to Pliny, heavier than any other, and swells more in baking. The common millet is grown in abundance in France, and is generally sown ridge for ridge, in the same fields with rye. In order to free their millet from its chaff, the French pound it in a wooden mortar, or pass it between mill-stones, which they keep sufficiently asunder to prevent the grains from being crushed. In the southern parts of France, especially at Bourdeaux, they prepare from the winnowed millet-seed, boiled in milk, a very favourite mess, not unlike rice-milk; they also make the seed into cakes, pastry, &c. The Africans consume large quantities of millet-seed, which they prepare for use by roasting it. The Tartars and Cossacks likewise derive their chief article of sustenance from this seed, which they mix with mare's milk, or with the blood drawn from the crural vein of the horse. Among the Arabians, there is a peculiar species of millet known, which they call *dourra*-(*hulcus durra*). Its seed is

large, flat, and remarkably white, and it is made into bread, which is baked under hot cinders. The Arabians chew the stalks which produce this kind of millet, and extract from them, by pressure, a highly saccharine juice. With the Arabian millet-seed the inhabitants of Corfu feed their pigeons.

In Great Britain the common millet-seed is used as an ingredient in puddings. The seeds ripen in August, when the plant must be cut down, and the seeds beaten out. If not protected from birds, they will devour the seed as soon as it begins to ripen. The stalks of common millet are considered wholesome fodder for cattle.

MILLING, in the manufactures, is the same as fulling, which see.

MILLION is the number of ten hundred thousand, or a thousand times a thousand.

MILREA, **MILREE**, or **MILREI**, a Portuguese money of account. It is so called, as consisting of a thousand reis, value 5s. 7½d. British money. See MONIES, *App*.

MILL-STONES, (GER. *Mühlsteine*. DU. *Moolensteen*. DA. *Møllstene*. SW. *Quarrstenar*. FR. *Pierres meulières*. IT. *Mole Macine*. SP. *Muelas de molino*. PORT. *Mós do moinho*. RUS. *Schernovoi kamen*. POL. *Mlinski kamien*. LAT. *Molaris lapis*.) the large circular stone, which, when put in motion by machinery, grinds corn and other articles. The diameter of the common mill-stones is from five to seven feet, and their thickness varies from twelve to eighteen inches. These stones were usually imported from Rouen and other parts of France, the burr-stones of that country being found more durable than our own. There is, however, a large quarry of this kind of stone at Conway, in North Wales, equal to any imported from foreign countries. Good mill-stones usually last 55 or 40 years; and when they have been employed for a long time, so as to be considerably diminished, they are edged, or fresh cut, in order to communicate to their surface a figure contrary to that which they originally bore; and afterwards the upper mill-stone is made the lower or bed-stone.

MINE, a place under ground, whence metals, minerals, or precious stones are dug up.

For gold and silver mines, the richest and most celebrated are in South America; iron mines are most abundant in France, Russia, Sweden, &c.; copper mines are chiefly in Sweden and Denmark; lead and tin mines abound most in England; quicksilver mines in Hungary and Spain; diamond mines in Golconda; and salt mines in Poland, &c.

Metallic mines are generally dug for in mountains, and as the metallic veins always run either horizontal or oblique, they are easiest found on the sides of eminences.

The metallic veins are commonly encompassed with a sort of stone peculiar to the mine, and accompanied with several strata of clay, gravel, rock, &c.

By all of which the miners know when they approach a vein. They discover that there is a mine in a mountain by the mineral stones that fall from it; the mineral taste of the waters; the quality of the exhalation; the difference between the earth over the mines, and that of the neighbouring parts; the frost lying on the adjacent places, when it thaws about the mines. And that the ground producing little grass, and that but pale, is an indication of a mine.

All mines of gold or silver belong to the king by virtue of his prerogative; but persons having mines of copper, tin, lead, &c. shall enjoy the same, although claimed to be royal mines. 5 W. and M. c. 6.

Tin, copper, iron, lead, and coal, mines, are those with which Great Britain chiefly abounds. Tin is found in Cornwall and Devonshire, and the mines and miners are under a particular code of laws, called the Stannary laws: copper abounds in the western, southern, and northern extremities of the kingdom; lead in the northern; iron in the midland counties; and coals, to some degree or other, in almost every part of the island, except a small portion of the eastern coast, where none have yet been discovered.

The last-mentioned mineral is of such high importance to the common comforts of life, as well as to the prosecution of most of our manufactures, that the mines, engines, &c. for the supply of them, are protected by several statutes. By 10 Geo. 2. c. 32. setting fire to coal mines is made felony *sans* clergy.

By 13 Geo. 2. c. 21. inundating them is made punishable by treble damages.

9 Geo. 3. c. 29., and 39 & 40 Geo. 3. c. 77., and lastly 56 Geo. 3. c. 125., in extension of the two former acts, protects all engines, and other erections belonging to coal-mines, as well as the roads and rail-ways to them, under the heaviest penalties. 2 and 3 Dick. *Pract. Expos. titles Coals and Mines.*

MINERAL. Every substance, which does not possess organization, or is not the immediate product of some organized body, belongs to the mineral kingdom. Among the numerous variety of materials, which demand the attention, and exercise the ingenuity, of the chemist and the manufacturer, some are compounded of such principles, and formed under such circumstances and situations in the earth, that it is difficult to distinguish them without recurring to the test of experiment. Others are formed with considerable regularity as to the proportion of their principles, their colour, fracture, specific gravity, and crystallised figure. Every practical mineralogist is naturally disposed to avail himself of the

external figure and obvious characters of bodies, to distinguish them from each other; and we daily see instances of great skill in this method of discrimination. It happens unfortunately, however, for the acquisition of this branch of knowledge, that the differences depend upon circumstances, which, for the most part, are scarcely communicable by mere description, without the exhibition of specimens. Hence it has, in many instances, happened, that chemists have obtained possession of quantities of minerals, the names of which they could not, with any degree of correctness, ascertain, until they had made some experiments to determine their component parts. Much industry has been employed with success in simplifying the experiments with re-agents, and with the blow-pipe, for this purpose. Thus it has happened that mineralogy has been assiduously cultivated by two different descriptions of men. The one have noted the figures, measured the angles, described the colours, transparency, opacity, texture as ascertained by fracture, hardness, and the like evident properties; the other have passed slightly over these indications, and have attended chiefly to such component parts as chemical analysis exhibits. The best system for the classification of minerals must be that in which the external characters, as well as the component parts, are noticed. The components parts or principals of minerals afford the great outlines for classing them under general species and varieties; and their external appearances, when not sufficiently decisive to the observer, will always be useful to point out the experiments he must make to ascertain their place. The modern systems are grounded on considerations of this nature.

MINERALIZER. Metallic substances are said to be mineralized, when deprived of their usual properties by combination with some other substance. The commonest mineralizers are sulphur, arsenic, and carbonic acid. Oxygen is as usual as any, but is not usually reckoned among mineralizers. Arsenic is likewise excluded from mineralizers by some writers, because, say they, it is always united to metals in its metallic state. The sulphuric, and muriatic, acids are less common mineralizers. The phosphoric acid exists in the green lead ore, and less evidently in some of the ores of iron. Lead is found mineralized likewise by the molybdic, and chromic, acids. Carbonic acid exists in many of the calciform ores.

MINIUM. Red lead, or minium, may be made directly from lead, and also from litharge, which can be had cheaper from various processes where lead is employed. But the latter red lead is not so good as the former, on account of the scoria of other substances mixed with the litharge. The makers of flint-glass, who use much red lead in the composition of their glass, find,

that it does not flux so well as that made from the direct oxidation of the metal, as practised in the county of Derby, where no less than nine mills or furnaces are kept on this operation. These furnaces are very like a baker's oven, with a low vaulted roof, and two party-walls, rising from their floor, which leave a middle space, where the pit-coal is burned: the flame, being drawn over the party-walls, strikes on the roof, and is thence reflected on each side, by which the lead there is kept melted. The surface of lead, by its exposition to air, becomes instantly covered with a dusky pellicle, which is successively removed; the greater part of the metal is thus converted into a yellowish-green powder, which is afterward ground fine in a mill, and washed; the heterogeneous particles of lead, still remaining, are separated by passing the wash through sieves; the yellow colour becomes uniform, and is called massicot, by the painters. The yellow oxide, being well dried, is thrown again into the furnace, where it is constantly stirred in a continual heat; so that in about 48 hours, this oxide acquires a vivid red, inclining to orange colour, and is known by the name of minium, or red lead. The red lead made in France is of a considerably worse quality than what is made in England or Holland. A ton of lead generally gives twenty-two hundred weight of minium. It is said, that at Nuremberg the increased weight of red lead amounts to one-fifth of the metal; this may probably depend on the method employed, as Watson thinks. Neumann says, that the best Venetian minium is made from ceruse, or white lead. *See* LEAD.

MINIVER, among furriers, is the skin taken off the belly of the squirrel.

MINT, the place in which the public money is coined. *See* COINAGE.

The officers of the mint are, 1. The warden of the mint, who is chief; he oversees the other officers, and receives the bullion. 2. The master worker, who receives the bullion from the warden, causes it to be melted, delivers it to the moneyers, and when it is coined, receives it again. 3. The comptroller, who is the overseer of all the inferior officers, and sees that all the money is made to the just assize. 4. The assay-master, who weighs the gold and silver, and sees that it is according to the standard. 5. The auditor, who takes the accounts. 6. The surveyor of the melting, who, after the assay-master has made trial of the bullion, sees that it is cast out, and not altered after it is delivered to the melter. 7. The engraver, who engraves the stamps and dyes for the coinage of the money. 8. The clerk of the irons, who sees that the irons are clean and fit to work with. 9. The melter, who melts the bullion before it is coined. 10. The provost of the mint, who provides for, and oversees all the moneyers. 11. The

blanchers, who anneal and cleanse the money. 12. The moneyers, some of whom forge the money, some shear it, some round and mill it, and some stamp or coin it. 13. The porters, who keep the gate of the mint.

MIROBOLANS, (*GER.* *Myrobolanen*. *DU.* *Myrobalaenen*. *DA.* *Myrbolaner*. *Sw.* *Mirobolaner*. *FR.* *Myrobolans*, *Mirobolens*, *Mirabolans*. *IT.* *Mirabolani*. *SP.* and *PORT.* *Mirabolanos*. *RUS.* *Myrobalaín*.) a small purgative fruit, of considerable utility in pharmacy. This drug is divided into divers species, namely, the lemon-coloured, the black, the *kebuli*, the *belerin* or golden, and the *Indian* mirobolans.

The yellow-coloured mirobolan is of a reddish-yellow, of an astringent, disagreeable flavour, in figure resembling a plum, and inclosing a small kernel, somewhat like that of a white pine-apple.

The second kind is black, sometimes shaded with green, about the size of a gall-nut, and may easily be broken into pieces.

The *kebuli* is very like the lemon-coloured mirobolan, but it is darker, larger, and of a more acrid taste.

The *belerin* is about the size of a nutmeg, externally of an orange-colour, yellow internally, and of an astringent taste.

The Indian mirobolan is somewhat long, about as thick as the top of a child's forefinger, black externally and internally, containing no nut, extremely hard, and of a bitterish astringent taste.

Mirobolans are brought from India, and are principally gathered in the vicinity of Goa, Bengal, and on the coast of Coromandel. The natives of India make use of them in tanning skins, and making ink. For the latter purpose they principally employ the black mirobolan.

MIRROR, a speculum, looking-glass, or any polished body, whose use is to form the images of distinct objects by the reflection of the rays of light.

Mirrors are either plane, convex, or concave. The first sort reflects the rays of light in a direction similar to that in which they fall upon it, and therefore represent bodies of their natural magnitude. But the convex ones make the rays diverge much more than before reflection, and therefore greatly diminish the images of those objects which they exhibit; while the concave ones, by collecting the rays into a focus, not only magnify the objects they show, but will also burn very fiercely when exposed to the rays of the sun; and hence they are commonly known by the name of burning mirrors.

Any kind of metal, when well polished, will reflect very powerfully; but of all others, silver reflects the most, though it has always been too expensive a material for common use. Gold is also very powerful; and all metals, or even wood, gilt and polished, will act very powerfully as burning mirrors. Even polished ivory, or straw

nicely plaited together, will form mirrors capable of burning, if on a large scale. *See* LOOKING-GLASS.

MISPECKEL, an ore of iron, consisting of that metal mineralized by arsenic. It is called *speiss* by the Bohemians. Its colour is generally of a bright white, resembling a mixture of silver and tin, sometimes, though seldom, variegated like a pigeon's neck, and is not easily altered by exposure to the air. Its form is either granular, cuspidated, coniform, prismatic, or rhomboidal. It is magnetic neither before nor after calcination, is soluble in acids, affords arsenic by distillation in the proportion of 50 or 40 per cent. and sometimes contains a small proportion of copper and silver. It is frequently mixed with other metallic ores, and often found in indurated clay, quartz, spar, schoerl, &c.

A marcasite found near Dublin, called Irish diamond, is of this species.

MISTLETOE, (GER. *Mistel*. DU. *Meer-entakken*. DA. *Mestertjene*. SW. *Mistel*. FR. *Gui*, *Guy*. IT. *Vischio*. SP. *Liga*, *Muerdago*. PORT. *Visgo*, *Visco*. RUS. *Oméla*. POL. *Jamiel*, *Jemiola*. LAT. *Viscum album*.) a plant always produced from seed, which is not to be cultivated in the earth, but will grow upon trees. The Mistletoe thrush, which feeds upon the berries of this plant in winter, conveys the seed from tree to tree; for the viscous part of the berry which surrounds the seed, sometimes fastens it to the bird's beak, which he strikes at the branches of a neighbouring tree, and so leaves the seed sticking by its viscous matter to the bark, which, if it lights upon a smooth part, will fasten itself, and the following winter put out.

Mistletoe will grow upon almost any tree. It was once famous in pharmacy, particularly for convulsions, apoplexy, palsy, and vertigo, but has lost much of its reputation of late years.

MITE, a small coin formerly current, equal to about one-third of a farthing.

It also denotes a small weight used by the moneyers. It is equal to the twentieth part of a grain, and is divided into twenty-four dots.

MITTS, or **MITTENS**, a sort of glove without fingers. *See* GLOVES.

MIZEN, in the sea language, is a particular mast or sail. The mizen-mast stands in the sternmost part of the ship. Its length is, by some, accounted the same with the height of the main-top-mast, from the quarter-deck; or half the length of the main-mast, and half as thick. The sail which belongs to the mizen-mast, is called the mizen-sail: and when the word mizen is used at sea, it always means the sail.

MOCHA, or **MOCHO STONE**. The agate, when it contains arborizations, or small figures of trees or moss, is called the Mocha-stone.

MOGGIO, an Italian measure of corn, equal to 4055 cubic inches English.

MOHAIR. (GER. *Mohr*. DU. and DA. *Moor*. SW. and FR. *Moire*. IT. *Moerrio*. SP. *Mue*, *Muer*. PORT. *Chamalote*, *Melania*. RUS. *Obiir*. POL. *Mora*.) The mohair goats are a variety of the common goats, being famous for their soft and silvery white hairs, the like of which is not to be found in any place but Angora. *See* GOAT.

The hair is commonly brought, ready spun, to Europe, and being woven into camlets and other manufactures, particularly by the English, is afterwards exported to all parts of the world, and even to those places whence the yarn was originally brought. *See* CAMLET.

MOHAIR-YARN, (GER. *Kamelgarn*. DU. *Turks garen*, *Stain van Angora*. DA. *Kamelgarn*. SW. *Kamelgarn*. FR. *Lame fille de chevron*. IT. *Filo d'Angora*, *Filo di Capra*. SP. *Hilo d'Angora*. PORT. *Fio d'Angora*. RUS. *Garuss*.) mohair spun into thread. *See* the preceding article.

MOIDORE, or **MOEDA**, a Portuguese gold coin, value 1*l.* 7*s.* sterling. *See* MONIES, *Appendix*.

MOLASSES, or **MELASSES**, the gross fluid matter that remains of sugar after refining, which no boiling can bring to a consistence more solid than syrup. It has lately been discovered, that molasses may be obtained by boiling the juice expressed from the sweeter kinds of apples, and evaporating three parts out of four. The spirit distilled from molasses is milder than that from corn, and is much used in making liqueurs.

MOLE. (GER. *Mankwurf*. DU. *Mol*. DA. *Muldverp*. SW. *Mulldad*. FR. *Taupe*. IT. *Talpa*, *Talpe*. SP. *Tapo*. PORT. *Toupeira*. RUS. *Krot*. POL. *Kret*. LAT. *Talpa*.) The fur of this little animal has long been employed by hatters as a substitute for beaver. They mix a small quantity of mole-hair with the more precious stuff; but they very seldom cover a hat entirely with it. The skin of the mole is generally black, though, like those of other animals of a blackish hue, it is sometimes found perfectly white, or cream-coloured. The radiated mole is a native of North America. It is somewhat smaller than the common mole, and is of a dusky or blackish colour.

MONCHA, or **MONKA**, a corn measure, used at Madagascar, for measuring husked rice, &c. and contains about six pounds weight of that grain.

MONEY. In the earliest ages, the ordinary way of traffic, no doubt, was by exchanging one commodity for another: but in process of time it was found necessary to have some common standard, according to which all other things should be estimated. The first account we have of money, is in the time of Abraham, who paid four hundred shekels for a burying-place. Money being a common measure for reducing mer-

chandise to a balance, the Greeks called it *νομισμα*, whence the term *Numismatics*. It was called *pecunia* by the Latins, either because the wealth of those days consisted in cattle (*pecus*), or, according to Pliny, that their coin was first stamped with the figure of a cow; they also called it *moneta*, because when the Romans wanted money, Juno admonished them to use justice, and there should be no want of money; hence she received the title of Juno Moneta, and money was coined in her temple. In process of time, money was made a goddess, called *Dea Pecunia*, under the figure of a woman holding a balance in one hand, and a cornucopia in the other. Numa Pompilius made money of wood, and of leather. The first silver money coined by the Romans was in the year of Rome 484, and their first golden coinage in 546. Among the ancient Britons iron rings, or iron plates, were used for money; among the Lacedæmonians, iron bars quenched in vinegar. Seneca observes that anciently stamped leather was current as money; a circumstance which occurred in England in the time of the barons' wars; and the Hollanders coined great quantities of pasteboard in 1574. In all nations where commerce has made any progress, the precious metals, or something to represent them, and professedly exchangeable for them, have been adopted. These precious metals have either been divided into small pieces, to answer the purpose of exchange, or have been made into coins of denominated value. See title COIN.

The impression on coins has been various in different ages and countries.

As to the figure of the coin, it is either round, as in England; multangular or irregular, as in Spain; square, as in some parts of the East Indies, or nearly globular, as in others.

Money, at present, is either *real* or *imaginary*. Real money includes all coins, whether of gold, silver, copper, or the like; such as guineas, pistoles, ducats, &c. &c. Imaginary money, or money of account, is that which never existed, or at least which does not exist in real specie, but is a denomination invented, or retained, to facilitate the stating of accounts, by keeping them still on a permanent basis, not to be changed like currency, which the authority of the sovereign sometimes raises, or depresses, according to the exigencies of the state: of this kind are pounds, livres, marks, &c. For an account of the monies of the world, see *Appendix*.

MONEYERS, are officers of the Mint, who work gold, and silver, money, and answer all the weight and charges.

MONEY-SCRIVENER, is one who is "a dealer in money, receiving other men's monies or estates into his trust or custody;" at least such is the description given by one of the statutes of James I. respecting bank-

rupts; and these persons are recognized accordingly by stat. 12 Ann. c. 6. against usury.

MONOPOLY, is an allowance from the king, by his grant, commission, or otherwise, to any person or persons, bodies politic or corporate, of, or for, the sole buying, selling, making, working, or using, of any thing, whereby any person or persons, bodies politic or corporate, are sought to be restrained of any freedom or liberty they had before, or hindered in their lawful trade. 3 Inst. 181. But it seems that the king's charter, empowering particular persons to trade to, and from, such place is void, so far as it gives such persons an exclusive right of trading, and debarring all others; and it seems now agreed, that nothing can exclude a subject from trade but an act of parliament. Raym. 481.

According to its general acceptance, the word monopoly imports the act of unlawfully buying up a particular commodity, with the intent of having the exclusive privilege of selling it at an advanced price, or setting up an exclusive right, by an individual, to the prejudice of the public at large. By common law, this is a punishable offence.

MONSOONS. See TRADE-WINDS.

MOORING, in the sea language, is the laying out the anchors of a ship in a place where she can ride securely. Mooring across is laying out on each side; and mooring along, is to have an anchor in a river, and a hawser on shore. When ships are laid up in ordinary, or are under orders for fitting for sea, the moorings are laid out in harbours; and consist of claws, pendant chains, cables, bridles, anchors, swivels, jews-harps, buoys, and chains.

MOOSE-SKINS, the American *elk-skins*. See ELK.

MORDANT, or MORDICANT, in dyeing, signifies those substances which are employed for the purpose of macerating the stuffs, and rendering them capable of imbibing the tinging matter. See DYEING.

MORESCO, or MORISCO, a kind of carving, painting, &c. done in the manner of the Moors; where several grotesque pieces and compartments are promiscuously intermingled, not containing any perfect figure, but a wild resemblance of birds, beasts, trees, &c. They are also called *Arabesques*, particularly when used in embroideries, damask-work, &c.

MORLING, or MORTLING, is that wool taken from the skin of a dead sheep, either dying of the rot, or killed, called in some counties mort-wool.

MOROCCO, or MAROQUIN, (GER. *Saffian*. DU. *Levantsch leër*. DA. and SW. *Saffian*. FR. *Maroquin*. IT. *Marroccchino*. SP. *Marroqui*. PORT. *Marroquim*. RUS. *Saffian*. POL. *Szaffian*. LAT. *Caprina aluta*.) a fine kind of leather prepared of the skin of an animal of the goat-kind, and imported from the Levant, Barbary, &c.

The name was probably taken from the kingdom of Morocco, whence the manner of preparing it was borrowed, which is this: the skins being first dried in the air, are steeped in water three days and nights; then stretched on a tanner's horse, beaten with a large knife, and steeped afresh in water every day: they are then thrown into a large vat in the ground, full of water, where quicklime has been slaked, and there lie fifteen days; whence they are taken, and again returned every night and morning. They are next thrown into a fresh vat of lime and water, and shifted night and morning for fifteen days longer; then rinsed in clean water, and the hair taken off on the leg with the knife, returned into a third vat, and shifted as before for eighteen days; steeped twelve hours in a river, taken out, rinsed, put in pails, where they are pounded with wooden pestles, changing the water twice; then laid on the horse, and the flesh taken off; returned into pails of new water, taken out, and the hair-side scraped; returned into fresh pails, taken out, and thrown into a pail of a particular form, having holes at bottom: here they are beaten for the space of an hour, and fresh water poured on from time to time; then being stretched on the leg, and scraped on either side, they are returned into pails of fresh water, taken out, stretched, and sewed up all around, in the manner of bags, leaving out the hinder legs, as an aperture for the conveyance of a mixture described below.

The skins thus sewed are put in lukewarm water, where dogs' excrements have been dissolved. Here they are stirred with long poles for half an hour, left at rest for twelve hours, taken out, rinsed in fresh water, and filled by a tunnel with a preparation of water and sumac, mixed and heated over the fire till ready to boil; and, as they are filled, the hind legs are sewed up to stop the passage. In this state they are let down into the vessel of water and sumac, and kept stirring for four hours successively; taken out and heaped on one another: after a little time their sides are changed, and thus they continue an hour and a half till drained. This done, they are loosened, and filled a second time with the same preparation, sewed up again, and kept stirring two hours, piled up and drained as before. This process is again repeated, with this difference, that they are then only stirred a quarter of an hour; after which they are left till next morning, when they are taken out, drained on a rack, unsewed, the sumac taken out, folded in two from head to tail, the hair-side outwards, laid over each other on the leg, to perfect their draining, stretched out and dried; then trampled under foot by two and two, stretched on a wooden table, what flesh and sumac remains scraped off, the hair-side rubbed over with oil, and that again with water.

They are then wrung with the hands, stretched, and pressed tight on the table with an iron instrument like that of a currier, the flesh-side uppermost; then turned, and the hair-side rubbed strongly over with a handful of rushes, to squeeze out as much of the oil remaining as possible. The first coat of black is now laid on the hair-side, by means of a lock of hair twisted and steeped in a kind of black dye, prepared of sour beer, wherein pieces of old rusty iron have been thrown. When half-dried in the air, they are stretched on a table, rubbed over every way with a paumelle, or wooden-toothed instrument, to raise the grain, over which is passed a light couche of water, then sleeked by rubbing them with rushes prepared for the purpose. Thus sleeked, they have a second couche of black, then dried, laid on the table, rubbed over with a paumelle of cork, to raise the grain again; and, after a light couche of water, sleeked over anew; and to raise the grain a third time, a paumelle of wood is used.

After the hair-side has received all its preparations, the flesh-side is pared with a sharp knife for the purpose: the hair-side is strongly rubbed over with a woollen cap, having before given it a gloss with barberries, citron, or orange. The whole is finished by raising the grain lightly, for the last time, with the paumelle of cork; so that they are now fit for the market.

Manner of preparing red morocco. — After steeping, stretching, scraping, beating, and rinsing the skins, as before, they are at length wrung, stretched on the leg, and passed after each other into water where alum has been dissolved. Thus alumed, they are left to drain till morning, then wrung out, pulled on the leg, and folded from head to tail, the flesh inwards.

In this state they receive their first dye, by passing them after one another into a red liquor, described hereafter. This they repeat again and again, till the skins have got their first colour; then they are rinsed in clean water, stretched on the leg, and left to drain twelve hours; thrown into water through a sieve, and stirred incessantly for a day with long poles; taken out, hung on a bar across the water all night, white against red, and red against white, and in the morning the water stirred up, and the skins returned into it for twenty-four hours.

The following is the quantity and proportions of the ingredients required for the red colour, for a parcel of 36 skins:

Cochineal, 150 drams
Round suchet (*crocus indicus*) 45 ditto.
Gutta gamba, 15 ditto.
Gum arabic, 10 ditto.
White alum pulverized, 10 drams.
Bark of the pomegranate tree, 10 ditto.
Citron juice, 2 ditto.
Common water, 120lbs.

The alum is gradually added to the other

articles, which are thrown into a copper where they should be boiled for about two hours, till one-tenth part of the water be consumed.

The *yellow* colour is communicated to morocco in a manner similar to the preceding; the common Avignon or yellow berries being substituted for cochineal, and employed in similar proportions.

The only difference between the processes of dyeing *red* and *yellow* is, that the former is tinged with the colouring matter before it is worked or polished with the wooden instruments, whilst the latter is dyed after having been so polished.

The Turks also manufacture *black*, *green*, and *blue* morocco; but these are not only destitute of lustre, but are extremely perishable.

The chief places, in which morocco leather is prepared, are Morocco in Africa, Astracan and Diarbekar in Turkey, which were the original seats of the manufacture. Besides these there are imitations of this species of leather prepared from goat, and sheep, skins, at Nicosia in the island of Cyprus, in Provence in France, in different parts of Spain, in Russia, and now at several towns in Great Britain and Ireland. The general name for morocco-skins, in the markets of Macedonia and Greece, is *cordovans*.

It is now manufactured to a considerable extent in London and its vicinity.

MORPHINE. The substance thus named by the French chymists is an alkaline salt obtained from opium, and which, in combination with a peculiar acid termed *meconic*, constitutes the narcotic principle of opium. It is in the form of greyish crystals; and is so powerful, that not more than an eighth or a quarter of a grain can, in general, be safely exhibited as a dose. It is, in many respects, preferable to opium as a medicine; being devoid of those irritating qualities dependent on the resinous matter contained in the latter substance.

Alkaline salts of the same species have been obtained from various other vegetable substances; as the alpine-laurel, *nux vomica*, St. Ignatius's beans, and *ipecacuanha*, all of which possess the principal medicinal qualities of the substances from which they are obtained, in a concentrated degree.

MORSE, or **SEA COW**. (GER. *Wallross*. DU. *Wallrus*. DA. *Hvalros*. SW. *Valtrus*. FR. *Morse*, *Vache marine*. IT. *Vacca marina*. PORT. *Vacca marinha*. RUS. *Morsch*. LAT. *Rosmarus*.) This animal is an inhabitant of the African seas, especially about the coasts of the Cape of Good Hope. Its teeth are exceedingly white, and are preferred to those of the elephant, from their hardness, and keeping their colour to any length of time. On this account they are much employed by dentists in the formation of artificial teeth. The skin of the morse is uncommonly durable and hard, and is, there-

fore, oftentimes used by the natives of Africa, as covering for their huts, shields, &c. The fat of the animal is employed as a substitute for butter at the Cape of Good Hope.

MORTALITY, *Bills of*, are accounts or registers of the number of births, marriages, and deaths, in any particular district. Such have been established for the special purpose of ascertaining the progress of population, at different periods, in various places in the kingdom; but, *colloquially* at least, and even *statutably*, the expression, without particular appropriation, is supposed to refer only to a certain district about the metropolis. Such a register was established there in 1728; but so ill are the limits to which the operation was designed to extend, or to which it does actually extend, defined, that even in proceedings at law against offences, of which this locality is made an essential characteristic by statute, (as *ex. gr.* the acts against bakers for selling light bread,) it has been found impossible to ascertain them with precision.

MORTAR, is a word of diversified application. It signifies that cement of lime, sand, and water, with which stones and bricks are bound together, in order to erect edifices; it also, with some additional epithet descriptive of its particular application, signifies those cements which serve to ornament the insides of buildings, and commonly known by the names of *drawing*, *stucco*, &c.

In *chemistry*, it is used for a vessel somewhat resembling an inverted bell, made of brass, copper, marble, and many other hard substances, in which matters are bruised and pounded.

In the *art military*, it signifies a piece of ordnance for the throwing of shells, shot, &c. See titles **BOMBS**, **CANNON**, &c.

MORTGAGE, signifies a pawn of land or tenement, or any thing immoveable, laid or bound for money borrowed, to be the creditor's for ever if the money is not paid at the day agreed upon; and the creditor holding land and tenement upon this bargain, is called tenant in the mortgage. He who pledges this pawn, or gage, is called the mortgagor, and he who takes it the mortgagee.

The last and best improvement of mortgages seems to be, that in the mortgage-deed of a term for years, or in the assignment thereof, the mortgagor should covenant for himself and his heirs, that if default is made in the payment of the money at the day, then he and his heirs will, at the costs of the mortgagee and his heirs, convey the freehold and inheritance of the mortgaged lands to the mortgagee and his heirs, or to such person or persons (to prevent merger of the term) as he or they shall direct and appoint; for the reversion, after a term of fifty or a hundred years, being little worth, and yet the mortgagee for want thereof con-

tinuing but a termor, and subject to a forfeiture, &c. and not capable of the privileges of a freeholder; therefore when the mortgagor cannot redeem the land, it is but reasonable the mortgagee should have the whole interest and inheritance of it to dispose of it as absolute owner. *3 Bac. Abr. 633.*

Although after breach of the condition, an absolute fee-simple is vested at common law in the mortgagee; yet a right of redemption being still inherent in the land, till the equity of redemption is foreclosed, the same right shall descend to, and is invested in such persons as had a right to the land, in case there had been no mortgage or incumbrance whatsoever; and as an equitable performance as effectually defeats the interests of the mortgage, as the legal performance does at common law, the condition still hanging over the estate till the equity is totally foreclosed; on this foundation it has been held that a person who comes in under a voluntary conveyance, may redeem a mortgage; and though such right of redemption is inherent in the land, yet the party claiming the benefit of it, must not only set forth such right, but also show that he is the person entitled to it. *Hard. 465.*

But if a mortgage is forfeited, and thereby the estate absolutely vested in the mortgagee at common law, yet a court of equity will consider the real value of the tenements, compared with the sum borrowed. And if the estate is of greater value than the sum lent thereon, they will allow the mortgagor, at any reasonable time, to recall or redeem the estate, paying to the mortgagee his principal, interest, and costs. This reasonable advantage allowed to the mortgagors, is called the equity of redemption. *2 Bl. 159.*

It is a rule established in equity, analogous to the statute of limitation, that after twenty years' possession of the mortgagee, he shall not be disturbed, unless there are extraordinary circumstances; as in the case of femes coverts, infants, and the like. *5 Atk. 313.*

Mortgages are subject to stamp duties, but not being, like bills of exchange, and many other things noticed here, the subjects of daily transactions among mercantile men, and also the distinctions and exceptions being somewhat voluminous, we forbear from giving them.

MOSAIC, or MOSAIC-WORK. Under the name of mosaic-work are included such performances as relate to inlaid work; as tablatures of stone, wood, metals, &c. What we are now treating upon is that which represents not only all sorts of figures in their proper colours, attitudes, and shapes, as large as those that are lasting ornaments in churches and other public edifices, but also in small, and fit to grace the cabinets of the great and curious, and imitate a picture painted in miniature.

The ancients, who practised this art with much skill and exactness, have left a variety of their performances, which are found not only in Spain, Italy, &c. but also in England. Those remaining at Rome are the finest, in the temple of Bacchus, now that of St. Agnes; and there are also curious pieces to be seen at Venice, Pisa, Florence, and other places.

The modern artists have improved very much in this performance, as is known to every traveller who has visited St. Peter's, and the palace of Borghese at Rome, St. Mark's at Venice, and the church of St. Felicia at Florence.

Such figures are composed, joined, and cemented together of various coloured stones; but since nature has scarcely, at least not sufficiently, supplied the proper shades requisite for a masterly performance, that defect has been made up by counterfeiting those colours, by art, in glass; which is done in the following manner:

The glass-materials are put in the crucibles or melting-pots, and being in fusion, such a colour is added as you would make your shades with, beginning with the lightest. Having mixed it well, and taken out the quantity you think proper with an iron ladle, put it on a smooth marble, flattening it with another to a proper thickness; then cut it quickly into small pieces, laying them, when cold, in a box for use: add more colour, and proceed as before, repeating it till you come to the deepest shade. If you would gild them, wet them on one side with gum-water, and lay leaf-gold upon them; and in an iron-shovel, covered with pieces of other glass, heat them red-hot in the mouth of a furnace, then take them out, and when cold, the gold will be so fixed and firm that nothing can hurt it.

When you begin to work, lay a thick ground against the ceiling or wall, with plaster, and having your design ready drawn and painted, on blue or brown paper, fasten part of it upon the wet plaster, and with a pair of small plyers, take up the small stones, and press them in their proper places; forming the figures and shades in their respective colours, as you are directed by your painted model. In this manner is done the history of "Our Saviour's walking with Peter on the sea," in St. Peter's church at Rome.

MOTHER-OF-PEARL, (GER. *Perlmutter*. DU. *Paarlemoer*. DA. *Perlemor*, *Perlamoder*. SW. *Perlmo*. FR. *Nacre*. IT. *Madreperla*. SP. *Madre de perlas*, *Concha de nachar*. PORT. *Madrepola*. RUS. *Schemtsé-kufhnuja rakovina*. POL. *Mercica perlowa*. LAT. *Mater perlarum*,) is the shell of the *mytilus margariferus*, or pearl-bearing muscle. It has the shell compressed and flat, nearly orbicular, the base transverse, and imbricated with dentated coats. It dwells in the ocean of either Indies. On the other

side it is exquisitely polished, and of the whiteness and water of pearl itself. It has also the same lustre on the outside, after the external laminæ have been taken off, by aqua fortis and the lapidary's mill. Mother-of-pearl is used in inlaid works, and in several toys, &c.

MOULD, in the mechanic arts, is a cavity cut, with intent to give its form or impression to some softer matter applied therein. In melting the mineral or metal glebe dug out of the earth, the miners or workmen have each their several moulds to receive the metal as it comes out of the furnace; but these are different according to the diversity of metals and works.

In gold mines they have moulds for ingots; in silver mines for bars; in copper and lead mines for pigs or salmons; in tin mines for pigs or ingots; and in iron mines for sows, anvils, chimney-backs, cauldrons, pots, boilers, and various merchandise of iron.

The following are the principal compositions and descriptions of moulds used in the mechanic arts:

Moulds of founders of large works, such as statues, bells, guns, &c. are of wax, supported withinside by what is called a *core*, and covered on the outside with a cap or case.

It is in the space which the wax occupied, which is afterwards melted away to leave it free, that the liquid metal runs, and the work is formed, being carried through a great number of little canals, which cover the whole mould.

Moulds of founders of small works are frames full of sand; it is in these frames, which are likewise filled with sand, that their several works are fashioned, into which, when the two frames whereof the mould is composed are rejoined, the melted brass is run.

Moulds of letter-founders. — These are partly of steel, and partly of wood; the latter, strictly speaking, serve only to cover the real mould which is within, and to prevent the workman, who holds it in his hand, from being incommoded by the heat of the melted metal.

Only a single type or letter can be formed at a time in each mould.

Moulds for paper-makers. — These are little frames composed of several brass or iron wires fastened together by another iron wire still finer.

Each mould is of the bigness of the sheet of paper intended to be made, and has a rim or ledge of wood to which the wires are fastened.

These moulds are usually called frames or forms.

Moulds for glaziers. — These are of two kinds, both serving to cast their lead: in the one the lead is cast into long rods or canes fit to be drawn through the vice, and the

grooves formed therein; this they sometimes term *ingot* mould. In the other they mould those little pieces of lead a line thick and two lines broad, fastened to the iron bars. These may be also cast in the vice.

Moulds for goldsmiths. — The goldsmiths use the bones of the cuttle-fish to make moulds for their small works, which they do by pressing the pattern between two bones, and leaving a jet or hole to convey the silver through, after the pattern has been taken out.

Moulds for masons. — The mason's mould is a piece of hard wood, or iron, hollowed withinside, answerable to the contours of the mouldings or cornices, &c. to be formed. This is otherwise called a *caliber*.

Moulds for plumbers are the tables whereon they cast their sheets of lead. These they call simply *tables*, besides which they have other real moulds, whereon they cast their pipes without soldering.

Moulds for tallow-chandlers are of two kinds; the first for the common dipped candles, being the vessel wherein the melted tallow is disposed, and the wick dipped.

These are made of wood of a triangular form, and supported on one of its angles, so that it has an opening at top of nearly a foot; the other used in the fabric of mould-candles is of brass, pewter, or tin.

Each candle has here its several mould.

Mould among gold-beaters, a certain number of leaves of vellum, or pieces of guts cut square, of a certain size, and laid over one another, between which they put the leaves of gold and silver, which they beat on the marble with a hammer.

Gold-beaters have four kinds of moulds, two whereof are of vellum, and two of gut; the smallest of those of vellum consists of forty or fifty leaves, the largest contains a hundred; for the other, each contains five hundred leaves.

The moulds have all their several cases, consisting of two pieces of parchment, serving to keep the leaves of the mould in their place, and prevent their being disordered in beating.

MOUNTAIN-WINE, a rich, sweet white-wine, which is produced in the neighbourhood of Malaga in Spain. See **WINE**.

MOUNTAIN BLUE, an ore of copper of a blue colour, most frequently of a loose pulverulent form, but sometimes indurated and even crystallized, but then it is mixed with quartz. According to Proust it differs from the green carbonat only in containing a large proportion of water, the simple loss of which changes its colour from blue to green.

MOUNTAIN GREEN is likewise a carbonat of copper, generally found in a loose and friable state, rarely crystallized and indurated, often mixed with calcareous earth and iron, and some arsenic. See **MALACHITE**.

MOUTH GLUE, (GER. *Mundleim*. Du. *Mondlym*. DA. *Mundlim*. Sw. *Mundlim*. FR. *Colle à bouche*. IT. *Colla da bocca*. SP. and PORT. *Cola de boca*.) a preparation of the common glue, so called, because it dissolves in the mouth, and then becomes fit for use. It is made of the finest common glue, which they break into small pieces, and soften by steeping in cold water for two days. They decant the water that swims above, and then melt the softened glue with a gentle heat. When it is very fluid, they incorporate therewith half its weight of ground sugar, of which the solution is assisted by a continual movement. This is run on a marble that has been rubbed with a linen cloth, which has imbibed good olive-oil. This plate is left to cool and congeal for four or five days; it is then extended on a towel doubled into four; it is covered again with another towel, and the whole charged with a plank on it. By this means it is not only flattened and rendered more compact, but all the oil is pressed out that might have been taken up from the marble. This pressure is renewed; and they cause the towels to be warmed, in order to produce more speedily the desired effect. It is then cut into small tablets or plates. These little cakes are dried, in replacing them between hot cloths, and loading them as before; this is repeated until the glue is dry and brittle. It is useful for various purposes in which a delicate cement is desirable.

MOZO, a measure in Spain and Portugal.

MUCILAGE, a general term used to denote a substance soluble in water, whether hot or cold, with which it forms a transparent, adhesive, or gluey mass. When obtained from vegetables, it is distinguished by the name of *gum*; that from animal substances, is called *glue* or *gelatine*.

MUCKEN, or **MACKEN**, a Flemish measure.

MUFF, (*Muffs*. GER. *Muffen*. Du. *Moffen*. DA. and Sw. *Muffer*. FR. *Manchons*. IT. *Mannicotti*. SP. *Manguitos*. PORT. *Manguitos*, *Regalos*. RUS. *Mufrii*. POL. *Rekawie*.) an article of dress, used chiefly by ladies for keeping the hands and arms warm. They are made of the skins of the bear, fox, Angora-goat, &c. They are principally manufactured at London, and are sold from one guinea up to twenty, according to the quality and description of the skin. See **FUR**.

MUID, a dry measure in France for corn, pulse, salt, lime, coals, &c. The muid of charcoal contains twenty mines, sacks, or loads.

Muid is also a liquid measure for wine, &c. used in France. It is divided into two demi-muids, four quarter muids, eight half quarter muids. See **WEIGHTS AND MEASURES**.

MULCTS, fines laid on ships or goods, for the maintenance of consuls, garrisons, &c.

MULE, an animal bred between a jack-ass and a mare; one of the most useful known, for draught, or burden. Those of Italy, and Spain, particularly the latter, are the finest in the world, and indeed so valuable that the exportation of them is prohibited. They have been bred in some of the West India islands of a large size, and are found extremely useful in the plantations. They are much more hardy, as well as safe-footed, than horses, and are kept upon provender that horses will not thrive upon.

The term mule is also, with us, applied metaphorically to a machine used in the manufacture of cloth.

MULLER, or **MULLAR**, denotes a stone flat and even at the bottom, but round at top, used for grinding various articles on a marble. The apothecaries use mullers to prepare some of their testaceous powders; and painters for their colours either dry or in oil.

MUM, a kind of malt liquor, much drunk in Germany, and formerly in England. The name commonly occurs in the statutes relating to exciseable liquors.

Take sixty-three gallons of water that has been boiled into a third part, brew it with seven bushels of wheated malt, one bushel of oat malt, and one bushel of ground beans; when it has worked or fermented a while in a hogshead not too full, put into it of inner rind of fir three pounds, tops of fir and birch one pound, *carduus benedictus* three handfuls, flowers of *rosu solis* a handful or two; burnet, betony, marjoram, pennyroyal, wild thyme, of each a handful and a half; of elder flowers, two handfuls; seeds of cardamom bruised, thirty ounces; barberries bruised, one ounce. When the liquor has done working, fill it up; and at last, put into the hogshead ten new-laid eggs, stop it up close, and at two years' end it will be fit for use.

MUNDIC, *marz*, a kind of marcasite, found in the tin mines, generally of a dark brown colour. The miners use no other vulnerary, but washing their wounds in water that runs from the mundic ore.

MURAS, or **MORAS**, a measure for rice and corn, used by the Portuguese at Goa, containing twenty-five paras, each para weighing twenty-two Spanish pounds.

MUSCADINE, a rich wine of the growth of Provence, Languedoc, and other parts of France. See **WINE**.

MUSCOVY-GLASS, consists of broad, elastic, flexible, transparent leaves, and differs externally from mica, only in being softer, and more soapy to the touch. It is capable of being split into laminae of the two or three hundredth part of an inch thick, and the plates naturally exhibit a strong electric state, affording sparks, when

torn asunder in the dark, even though previous friction be carefully avoided.

MUSHROOM STONE, a stone used in Italy for producing mushrooms, by keeping it moistened with water in a cellar. There appear to be two kinds of it; one found in the chalk-hills near Naples, resembling a white stalactite, intermixed with fine roots of shrubs; the other is a hardened turf from some volcanic mountains near France. To render these stones more productive, and prevent their quality of producing mushrooms from being exhausted, it is necessary to moisten them with water, in which mushrooms have been washed.

MUSK, (GER. *Bisam*, *Moschus*. DU. *Muskus*. DA. *Desmer*. SW. *Desman*. FR. *Musc*. IT. *Muschio*. SP. *Almizela*. PORT. *Almiscar*. RUS. *Muskus*. POL. *Pizmo*. LAT. *Moschus*.) a very strong-scented substance, found under the belly of the male of a species of goat, called *moschus mosiferus*. After killing the animal, the peasants cut off the bag containing the musk. It is about the size of a hen's egg, and is situated nearer to the organs of generation, than the navel. In its original state, it is nothing more than putrid blood, which coagulates in this bag. The largest bladder does not furnish above half an ounce of musk, and that of the common size seldom more than a quarter of an ounce. Musk affords such a strong smell that it becomes disagreeable, if not kept at a distance, or weakened by the admixture of other substances. It is likewise so fixed and permanent, that at the end of several years it seems to have lost no part of its pungency. It comes to us dry, with a kind of unctuousity, of a dark reddish, or rusty blackish, colour, in small round grains, with very few hard black clots, and perfectly free from any sandy, or other visible foreign matter. If chewed, and rubbed with a knife on paper, it looks smooth, bright, yellowish, and free from bitterness. Laid on red-hot iron it catches flame, and burns almost entirely away, leaving only an exceedingly small quantity of light greyish ashes: if any earthy substances have been mixed with the musk, the quantity of the residuum will readily discover them. The best and greatest quantities of musk come from Thibet, whence they are carried for sale to Patna, the chief town of Bengal.

A carnivorous quadruped, met with in China, and the East, and West, Indies, called a civet or musk cat, but bearing a greater resemblance to a fox or a marten than a cat, produces musk in abundance. Several of these animals have been brought into Holland, and afford a considerable branch of commerce, especially at Amsterdam. It is not necessary to kill the civet-cat in order to obtain its musk, which in summer is squeezed out of its pouch every other day, and in winter twice a week. The quantity produced at once is from two scruples to a drachm or

more. The juice thus collected is much purer and finer than that which the animal sheds against shrubs or stones in its native climates.

The species of musk-cat which inhabits Siberia yields a very inferior sort of musk, having the flavour of castor. This animal is a diminutive of the beaver, and is also to be met with in North America.

Musk is much used as a perfume; the Italians make it an ingredient in perfumed oils, and thus obtain the whole of its scent; for oils dissolve the entire substance of musk. As a medicine, musk is held in high estimation in the East, and has been introduced into very general use among Europeans, especially in those disorders which are commonly termed nervous: and in convulsive cases it is often given in large doses with great success.

MUSK-SEED, (GER. *Bisamkörner*. DU. *Muskuszaad*. DA. *Desmerkorn*. SW. *Desmanskorn*. FR. *Ambrette*, *Grain musquee*. IT. *Granelli d'ambretta*. SP. *Ambarilla*. PORT. *Ambaralli*. POL. *Ziarka pigmowe*. LAT. *Abelmoschi grana*.) is the seed of a plant which grows in Egypt, the West Indies, and in Gallam, a kingdom of Africa. This seed yields an odour precisely similar to that of real musk, and is accordingly employed with success in the composition of several species of perfume. The Italian perfumers consume vast quantities of it, and in France it is customary to form it into necklaces, bracelets, and other toys, for the use of children. The musk-seed brought from the island of Martinico is accounted better than any other. This seed ought to be chosen fresh, plump, dry, perfectly clean, and of a strong odour. See **AMBER-SEED**.

MUSKET, (*Muskets*. GER. *Flinten*. DU. *Musketen*. DA. *Flinter*, *Musketer*, *Musqueter*. SW. *Büssor*. FR. *Fusils*, *Mousquets*. IT. *Schioppi*, *Moschetti*. SP. *Escopetas*. PORT. *Espingardas*, *Mosquetes*.) the sort of gun or fire-arm generally used by foot-soldiers. The length of the regulation musket, or that which is in use among the regular army, is fixed at three feet eight inches from the muzzle to the pan.

MUSKETOON, a kind of short thick musket, whose bore is the thirty-eighth part of its length.

MUSLIN, (GER. *Musselin*, *Nesseltuch*. DU. *Neteldoek*. DA. *Netteldug*. SW. *Nüttelduk*. FR. *Mousseline*. IT. *Moussolina*. SP. *Moselina*. PORT. *Cassa*, *Caça*, *Musselina*. RUS. *Kissea*. POL. *Mustin*.) is derived from the word *mousale* or *mouselin*, a name given to it in Mesopotamia, where large quantities are made. It is a fine thin sort of cotton cloth, which bears a downy nap on its surface. Formerly all muslins were imported from India; but at the present day very considerable quantities are manufactured at Manchester, Glasgow, Paisley, &c. which

for fineness and durability are little inferior to those of the East; and it is a singular fact, that we now export large quantities of muslin, of British manufacture, to India, because we can afford to sell them at a price inferior to what they can be manufactured for there. British muslins, nevertheless, acquire a yellowish cast, after they have been repeatedly washed; whilst the genuine Indian muslins retain their original whiteness. This is supposed to arise from the cotton composing the former being spun by machinery, the latter by the hand. Muslins are of various qualities and descriptions, according to which they are named. The most considerable of these species are noticed under their proper heads. In general muslins are perfectly plain, but they are not unfrequently ornamented with raised and open work; and are oftentimes painted, printed, and dyed.

MUST. (GER. and DU. *Most*. DA. and SW. *Must*. FR. *Moût*. IT. *Mosto*. SP. *Musto*. PORT. *Mosto*. RUS. *Melodoe winoe*. POL. *Moscz*. LAT. *Mustum*.) The juice of the grape previous to the commencement of fermentation. The word is likewise occasionally used to denote other saccharine juices in the same state.

MUSTARD, (GER. *Mustert*, *Senf*. DU. *Mostert*. DA. *Senep*. SW. *Mostert*. FR. *Moutarde*. IT. *Mostarda*. SP. *Mostaza*. PORT. *Mostarda*. RUS. *Gortschiza*. POL. *Musztarda*. LAT. *Sinapis*.) is a plant of which there are seventeen species, three of which are natives of Great Britain; the *sinapis alba*, *nigra*, and *arvensis*. The alba or white mustard, which is frequently cultivated as a salad-herb, for winter and spring use, produces white seeds, employed for making the sauce called mustard.

The nigra, or common mustard, is frequently found growing naturally, but it is also cultivated in fields, for its brown seed.

The arvensis grows on arable land in many parts of Great Britain. The seed of this is sold under the name of Durham mustard-seed. The white, and brown, are commonly imported from Holland, though always inferior to that of English growth. Brown is more valuable than white, and is chiefly used for pickling.

Mustard, by its pungency, stimulates the solids; and hence it is recommended for exciting appetite, assisting digestion, promoting the fluid secretions, and for the other purposes of the acrid plants called antiscorbutic. It imparts its taste and smell in perfection to aqueous liquors, and by distillation with water yields an essential oil of great acrimony. To rectified spirit its seeds give out very little either of their smell or taste. Subjected to the press, they yield a considerable quantity of mild and insipid oil, which is as free from acrimony as that of almonds. They are applied as an external stimulant to benumbed or paralytic

limbs, to parts affected with rheumatic pains, and to the soles of the feet, in the low stage of acute diseases for raising the pulse.

Flour of mustard is the name given by traders to the seed of mustard, reduced by grinding to the state of an impalpable powder.

Mustard is much cultivated about Wisbeach. A good crop will yield five or six coombs per acre, and it sells from 8s. to 21s. a bushel. It is, after being in full blossom, subject to a fly, which damages it greatly.

In newly-inclosed marsh or fen land, mustard is often the chief crop. They sow a quarter of a peck of seed per acre, from Candlemas to the end of March; hand-hoe the plants once or twice, as wanted, thinning and setting them out at nearly equal distance. The crop is reaped the beginning of September, and tied in sheaves, leaving it three or four days on the stubble: it is stacked in the field, and these stacks are called *pies*. If it get rain in the field, it turns grey, and loses half its value. It is threshed in the autumn, being left for a sweat, which improves the colour. A good crop amounts to six or seven coombs an acre, and the common price at Lynn is about 20s. a bushel; but is sometimes so low as 7s. 6d. to 10s. a bushel. The common practice near Wisbeach, is to sow four crops in succession; the second is usually as good as the first: and after four years' mustard, they have a crop of wheat and then fallow. In old cultivated lands, four or five coombs is a good crop.

MUTUAL DEBTS. Where two traders are indebted to each other, one debt may be set off against the other, and in cases of bankruptcy, mutual credits, as well as mutual debts, may be set off.

MUTUAL PROMISE, is where one man promises another to pay money, or do some other act, and he, in consideration thereof, promises to do a certain act, &c. Such promises must be binding, as well on the one side as the other; and both made at the same time. 1 *Salk*. 21.

MYRIAD, the number of ten thousand.

MYRRH, (GER. *Myrrhen*. DU. *Mirrhe*. DA. *Myrr*. SW. *Myrrha*. FR. *Myrrhe*. IT. and SP. *Mirra*. PORT. and LAT. *Myrrha*.) a gum resin, brought from the East Indies, and likewise from Alexandria, Smyrna, and Aleppo.

This gummy resin is liable to great abuses; the larger masses in particular are frequently no other than some artificial composition, skilfully incrustated on the outside with a solution of myrrh. Some report that bdellium is nearly allied to myrrh, and not easily to be distinguished from it; the differences, however, are sufficiently obvious, bdellium being darker coloured, and less transparent, than good myrrh, internally soft and tenacious, (which myrrh never is), yielding a quite different smell, and wanting its bitterness.

Of the tree which produces myrrh we have no certain account; according to Bruce, it belongs to the *genus mimosa*, and grows in Abyssinia and Arabia.

Grand Cairo is the great staple for the myrrh-trade; but by far more considerable quantities are brought from Arabia Felix, than from Ethiopia and Abyssinia; and the quality of the latter, distinguished also by the name of Troglodite myrrh, was always more valued.

MYRTLE-BERRY is the fruit of the myrtle. We are supplied with it from the southern part of Europe. These berries are a strong astringent, and in that capacity were formerly much used in pharmacy. They are now used in perfumery, affording an agreeable essence. They will also yield a blue colour for dyeing, and would be useful in tanning thin leather, where a sufficient quantity can be procured at a moderate expense.

MYRTLE-WAX. This substance, obtained from the *myrica cerifera*, has in part the tenacity of bees' wax, without its un-

tuosity, and along with it, in some degree, the brittleness of resins. Its colour is a pale green. Specific gravity about 1.015. It melts at 109°; and, at a temperature sufficiently high, burns with a peculiarly clear, white flame, producing little smoke, and emitting an agreeable aromatic smell. Water has no action upon it. About four-fifths of it are soluble in 20 times its weight of alcohol at a boiling heat; but it is deposited by cooling, and standing a few days. Oil of turpentine softens it, and by the assistance of heat dissolves it. Caustic potash by boiling converts it into a soap. The mineral acids act upon it, though feebly. From all its habitudes it appears to be a fixed vegetable-oil rendered concrete by the addition of oxygen.

MYSTERY, in its commercial application, means any trade or art which requires skill; and therefore the previous preparation of an apprenticeship before it can be exercised. In this sense it is frequently to be met with in our statutes.

N A I

N A I

N, The thirteenth letter of the alphabet. As a numeral it stands for 900; and with a dash over it thus, Ñ, stands for 900,000. N. or N^o. stands for *numero*, or number; and N. B. for *nota bene*, note well, or observe well. N. P. for *Notarius Publicus*, or Notary Public.

NAIL, a measure of length, containing the sixteenth part of a yard.

NAILS, (GER. *Nägel*, *Spiker*. DU. *Spykers*. DA. *Spiger*, *Süm*. SW. *Spikar*. FR. *Cloris*. IT. *Chiodi*, *Chiovi*, *Aguti*. SP. *Clavos*. PORT. *Cravos*, *Pregos*. RUS. *Gwosdi*. POL. *Gozdzie*.) are small spikes of iron, brass, &c. which being driven into wood, serve to bind several pieces together, or to fasten something upon them. There are various sorts of nails: as *back and bottom nails*, which are made with flat shanks to hold fast, and not open the wood; *clamp-nails*, for fastening the clamps in buildings, &c.; *clasp-nails*, whose heads clasping and sticking into the wood, render the work smooth, so as to admit a plane over it; *clench-nails*, used by boat and barge-builders, and proper for any boarded buildings that are to be taken down; because they will drive without splitting the wood, and draw without breaking; of this there are many sorts; *clout-nails*; used for nailing on clouts to axle-trees; *deck-nails*, for fastening of decks in ships, doubling of shipping, and floors laid with planks; *dog-nails*, for fastening hinges on doors, &c.; *flat-points*, much used in shipping, and pro-

per where there is occasion to draw and hold fast, and no inconvenience of clenching; *jobent-nails*, for nailing thin plates of iron to wood, as small hinges on cupboard-doors, and the like; *lead-nails*, for nailing lead, leather, and canvas, to hard wood; *port-nails*, for nailing hinges to the ports of ships; *pound-nails*, which are four-square, much used in Norfolk, Suffolk, and Essex, and scarcely any where else, except for paling; *ribbing-nails*, for fastening ribs of ships in their places; *rose-nails*, which are drawn four-square in the shank, and commonly in a round tool, as all common two-penny nails are; in some countries all the larger sort of nails are made of this shape. *Rother-nails*, which have a full head, and are chiefly used in fastening rother-irons to ships; *round-head-nails*, for fastening on hinges, or for any other use where a neat head is required; these are of several sorts; *scupper-nails*, which have a broad head, and are used for fastening leather and canvas to wood; *sharp-nails*, having sharp points and flat shanks, and are much used, particularly in the West Indies, for nailing soft wood; *sheathing-nails*, for fastening sheathing-boards to ships; *square-nails*, which are used for hard wood, and nailing up wall-fruit; *tacks*, used for fastening paper to wood, the middle size, for wool cards, upholsterers, pump-makers, &c. There is scarcely a town or village in Great Britain in which nails are not forged; but the prin-

cial seats of this useful branch of the manufactures are at Birmingham, Wolverhampton, Dudley, Sheffield, and a small district in the county of Derby. This manufacture is of great importance, from the consumption of the commodity in all the mechanic arts and trades. It was the subject of a patent in 1808, the object of which was intended to expedite the operation, but the Americans are said to exceed us much in the whole of this manufacture.

NAINSOOKS, a species of Bengal muslins.

NALI, or **HALI**, an East Indian weight. See **GUPPAS**.

NANKEEN, or **NANKING**, (*GER. Nanking. DU. Nankings linnen. DA. and Sw. Nanking. FR. Toile de Nankin. IT. Nanquino. SP. Nanquina, PORT. Nanquin.*) a species of cotton cloth closely woven. It takes its name from Nanking a city of China, where the reddish thread of which the stuff is made, was originally, and still is, spun. This manufacture has been carried to the highest pitch of perfection in the East Indies, where vast quantities of white, pink, and yellow nankeens are made. At Manchester, and in other parts of Great Britain, these articles are imitated with success; though the British nankeens are inferior, it must be allowed, to those of India, but time may bring them to the same perfection. The Indian nankeens are not only more durable, but hold their colour much longer than the British; which can scarcely undergo three washings without being altered. The cotton employed by the Orientals in the manufacture of nankeen, is *naturally* of a reddish colour, whereas we are obliged to impart the proper hue to our material by means of dyeing; this will serve to account for the durability of colour in the one commodity, and the weakness in that of the other.

The nankeens imported into England by the East India Company come under the general denomination of piece-goods; their qualities are various, and there is generally abundance of them in the market. Nankeens are mostly used in England in the formation of trowsers, and waistcoats, for men's wear, during the summer, and for women's pelisses, &c. In some of the more southern parts of Europe, and in the warmer countries of Asia and America, as also in the British settlements in Africa, nankeen is worn by both sexes, the whole year round, and constitutes the chief part of their external attire.

Cotton has a very strong affinity for oxide of iron, so that if it be immersed in a solution of any salt of iron, it assumes a chamois colour, more or less deep, according to the strength of the solution. The action of the air on the oxide of iron deepens the colour, and if the shade were at first deep, the texture of the stuff is liable to be corroded by

it. To prevent this, the cotton should be immersed in the solution cold, carefully wrung, and immediately plunged into a ley of potash, mixed with a solution of alum. After having lain in this four or five hours, it is to be wrung, washed, and dried.

To give a nankeen-colour, prepare the cotton yarn by boiling it five hours in a mixture of water made grass-green with sheep's dung, and a solution of white soap; twice more, an hour each time, with half the quantity of soap; and a fourth time in a ley of pot or pearl ashes, one pound to twenty of yarn, another hour. Then pass it through iron, to every gallon of which, half a pound of red chalk or ruddle in powder must be added, the liquor being poured off clear, after it has stood four hours to settle, and immerse it in an alkaline lixivium. When the proper colour has been obtained, for which this operation may be repeated, if necessary, dry it, as after each of the former processes, then put it into a warm lixivium, in which it is brought to a scald. It is afterwards to be soaked an hour in water, made almost as sour as lemon-juice, with sulphuric acid, and then washed and wrung twice. Lastly, it is to be boiled slowly an hour in a solution of white soap, one pound to ten of the yarn.

NANQUE, the smallest weight used at Madagascar for weighing gold and silver; it is equal to six grains.

NAPHTHA. (*GER. and DU. Bergbalsam. DA. Biergbalsom. SW. Bergbalsam. FR. Napthe. IT. SP. and PORT. Nafta. RUS. Nefti. POL. Kley ognisti. LAT. Naphtha.*) A fine thin, fragrant, colourless oil, which issues out of white, yellow, or black clays, in Persia or Media, is known by this name. It burns with a blueish-yellow flame; is as inflammable as ether; and, like it, extracts gold from aqua regia. It is not decomposed by distillation; and yet, if long exposed to the air, it changes colour, thickens, and degenerates into petrol. Its smell is very different from that of vegetable oils; it dissolves resins and balsams; but neither gum resins, nor caoutchouc. It dissolves the essential oils of thyme and lavender; but is insoluble in spirit of wine and ether. Its specific gravity is 0.708.

NAPLES YELLOW. (*GER. Napelgelb, Neapolitanisch gelb. DU. Napels geel. DA. and SW. Neapelgult. FR. Jaune de Naples. IT. Giallofino. SP. Amarillo de Napoles. PORT. Amarelo de Napoles. RUS. Spelt Neapolitanskaja.*) According to Professor Beckmann, this colour is prepared by calcining lead with antimony and potash in a reverberatory furnace. The proportions are different, but the antimony appears never to exceed four-fifths of the lead, or be less than half: and the potash varies from two-fifths of the weight of the metals to an eighteenth. Sometimes also common salt is added.

NARD; *Indian*, or **SPIKENARD**, (GER. *Spikanarden*, *Indianische*, *Narden*. DU. *Spikanard*, *Indische* *Spikanard*. DA. *Spikenardes*, *Indisk* *Spikrod*. SW. *Spikanarde*. FR. *Nard Indien*, *Spicanard*. IT. *Spigonardo*. SR. *Espicanardi*, *Nardo-Indiano*. PORT. *Epicanardo*, *Nardo Indiano*. RUS. *Spikanard*. POL. *Spikanarda*. LAT. *Nardus*, *seu Spika Indica*.) consists of a number of slender, brittle filaments, supposed by some to be the root, by others the pedicle of the leaves of a plant of the grass or rush kind; but which are properly the head of a root: for Pomet mentions and figures a specimen, which had great part of the root adhering. According to Sir William Jones, it is a species of valerian. Spikenard has a very strong, not agreeable, smell and taste, scarcely to be concealed by a large admixture of other substances. In the *Theriaca Coelestis*, a mixture of many drugs of strong smells and tastes, spikenard enters, but in a small quantity, into the composition, and yet prevails over all the rest. It contains but a small proportion of essential oil.

NASARA, a silver money, struck at Tunis, of a square figure.

NATIONAL DEBT, is a debt due by any whole political community, as represented by their legislature and government. It can be contracted only by the authority of the sovereign power of the community, for purposes which are referable to the good of the whole. A dissolution of the political combination of the state, virtually abolishes, perhaps with injustice, the rights of those to whom the debt of the nation is due. No unauthorised act of any individuals of the nation, can contract a debt, which it shall be incumbent on the community to pay.

It is only since the æra of the Revolution in 1688, that the British legislature and government have succeeded in forming to themselves that stability of national credit, which gives them the command of the opulence almost of the whole world, and which has enabled them to contract national debt, to an amount, of which it is hardly possible to think without astonishment. In the case of the national debt of Great Britain, the system of public credit, and of providing for public exigencies by borrowing, has been carried to such a pitch, and has been so completely unfolded in almost all its possibilities and relations, that in considering it alone, we may easily acquaint ourselves with all that is necessary to be known concerning this subject.

It is impossible that national debt, where a legislature and government have credit to contract, can have a speedy tendency, which has been ascribed to it, to ruin the nation; otherwise, Britain must, long ere this time, have been utterly undone by the weight of its public debts.

In truth, the scheme of providing for the

public exigencies by contracting national debt, rather than by exacting at once from the state the whole sum which is wanted, is, a plan for taking one pound from me to-day, out of ten pounds which I possess, and for charging me with an annual rent of sixpence upon the nine pounds left me, instead of taking away my whole ten pounds at once and burthening me with no annual charge whatever.

The rise of the present system of national debt in England was gradual and experimental. Neither the wishes nor the abilities of the people could have supplied those moderate sums which were requisite for the wars of William the Third; if the plan of borrowing upon the credit of the taxes of future years, had not been adopted. A part, the people were not unwilling to advance. What remained to them was a capital, by the prudent and industrious use of which, they were enabled to provide the other payments against the stipulated time, without any farther diminution of their capital.

The expenditure of the national debt contracted in the reign of king William, and of his successor queen Anne, was attended with one peculiar disadvantage. It was consumed chiefly in wars on [the continent, the necessities for which were supplied by the Dutch, and by the other trading, manufacturing, and agricultural people of the continent, not in any great proportion, by the British nation. The agriculture, manufactures, and trade of Britain had not then risen to a pitch of greatness, at which all money expended in war, must, for the greater part, be paid for articles of their produce. Very much of that money which was borrowed to be spent in the wars of king William and queen Anne, was utterly lost to the nation in consequence of the manner in which it was laid out. Nevertheless, the raising of it by loan, rather than by direct exaction, left still so much more of capital, than would otherwise have been left in the hands of those who wanted it the most; that, at the end of a few years, the nation felt itself to have been little, if at all, impoverished by the debt and expense.

In every subsequent period of the British funding system, the case has been still the same. While only interest was to be paid, instead of a capital, abstracted at once from the peasant, the artisan, the farmer, the landholder, the merchant, these different persons were enabled to augment the capital which remained to them in such a manner, that there was soon, above its original amount, a surplus more than adequate to that which they were to pay in perpetual interest. Had their capital been taken away at once, no second such contribution could have been obtained, no loan could ever after have been raised.

Besides, in the progress of British affairs,

such have been the changes in our agriculture, manufactures, and trade, that almost all money, laid out by the British government, whether in naval equipments, military expenditure, or subsidies, must quickly find its way back into the strong boxes of our merchants, into the pockets of our artisans, peasantry, and sailors. It is almost all to be laid out upon the produce of British industry. This order of things has been continually confirmed and extended in the progress of the eighteenth century. Its direct tendency has been, to render all our public expenditure, and in particular, that which is supplied by the contracting of national debt, less injurious to the general prosperity of the empire, than it would otherwise necessarily prove.

Had we raised by direct exaction all that has been necessary for the public expense in the course of the present century, our traders, agriculturists, manufacturers, must have been without capital; we could have had no happy influence in the political system of Europe; we should have had few or no establishments of splendour and luxury dispersed over the land. On the contrary, as things now are, the surplus wealth of the whole nation, above what would be sufficient to pay off the property of foreigners, is, most probably greater, undoubtedly not less, than if we had never experienced any necessities of public expenditure, such as to demand either loans or extraordinary exactions.

Why, then, have the loans of the present war been procured on terms less favourable than those on which the loans of the American war were obtained? Why were the terms of the loans of the American war more disadvantageous than those of the war which preceded it?

It is true, that in the course of this period, the interest upon the public loans has gradually risen from the rate of not much more than 1-30th per cent. to little less than 1-18th per cent. But, in the case of many of these loans, the bargain with the lenders has been more or less favourable, in consequence of temporary and accidental causes, unconnected with the real advantages or disadvantages of this mode of providing for extraordinary public expenditure. Such were the popularity or unpopularity of a war or a minister, a good or bad harvest, the humours of a few monied men, transient errors of public opinion, in regard to the true nature of funding, &c. &c. As to all else, the increasing weight of the interest upon the successive loans to the public, has, undeniably, its origin from the increase of our national prosperity. Trade continues to be profitable during war. An immense capital is employed in manufactures which were before unknown. A prodigious additional capital is applied to the works of agriculture, since the farmer is now no longer a poor,

naked peasant, but, in truth, a thriving manufacturer and merchant. Canal-companies, insurance-companies, and so many others, present to the monied men, a multiplicity of other advantageous ways of investing their property, so sure and so lucrative, as to come into competition with the funds created by the government. These are the true general causes of the gradual enhancement of the interest upon the public loans.

But, what then, are the direct and immediate commercial utilities of the public funds?—1. In the first place, the general sense of the public necessities, for the sake of which those funds were created, has ever tended to excite to new industry, to restrain to new frugality, and thus to command that improved activity and discretion by which alone the general wealth can be, at any time, increased. 2. The creation of these funds has, from time to time, called forth into a circulation, in which it redoubles, or even farther multiplies itself, money which might have otherwise been uselessly locked up, or perhaps transferred to other countries and nations. 3. Funding is, virtually, the sale of a right to a certain part of the annual produce of the lands, industry, and trade of the country, to those who become proprietors of the stock. It therefore contributes, in the happiest manner, to the reciprocal communication between labour and capital, money-wealth, and wealth-in-land, of their respective advantages. The interests of the land-holders, the possessors of money-capital, and the labourers, were never, in any other country, so well associated, and, as it were, amalgamated together, as in Great Britain. ¶ This is, in a great measure, the effect of the existence of the public funds of the national debt. 4. We could not possess any great reservoir of money and commercial credit equal to money, upon the faith of less than national security. We could have no great national bank, in any degree, adequate to the commercial necessities of the British empire, upon any other foundation, than that of the plighted faith of our legislature and government. If we were possible that the whole capital of the British national debt, could have been squandered away, without contributing to either improvement or defence, yet could, in all other respects, have remained such as it is at present; even in that case, the commercial advantages which have been stated, as resulting from the existence of this national debt, are, perhaps, sufficiently great, to make us desire rather to bear, than to be wholly free from it. 5. Beside that part of the public funds which has formed a basis for our banking system, the rest of the stock is, likewise, an admirably useful engine of commerce. It is, in truth, a sort of money which does not necessarily pass in continual circulation, yet is ever ready to be put, with

little difficulty, into a moderate circulation, whenever the necessities of trade shall demand an increase in the quantity of our circulating medium. The national debt of Great Britain, in the hands of the stockholders, is, virtually, a bank of lands, industry, and moveable wealth. I can sell or purchase stock, as is demanded by the trade in which I am concerned, so much more conveniently, at all times, than either houses, lands, furniture, even goods in my warehouse, that, as a medium for commerce, it approaches very near to the ready utility of money in my pocket, or in the care of my banker. The merchant, the farmer, the man of a liberal profession, in all ordinary states of our affairs, finds it as convenient to have his pecuniary property in the stock, as in any other possible form. On great emergencies of trade, it is easier to convert stock, than land, or other possessions, into a state in which it may be used, either at home or abroad, for the support of commercial credit.

Thus is stock a sort of middle property between lands, and goods, on the one hand, and money on the other, which affords, without labour, the income of an estate, yet is transferable in trade, little less conveniently than ready money.

It is generally supposed, that the facility with which a British administration can borrow money for the public expenditure, renders this government much more profuse than that of any other nation. But that is an erroneous inference. The government, that has a sort of commercial credit to maintain, must, of necessity, be much more cautious in its expenses, than one which depends for its revenue upon mere authority and force.

On the whole, then, it may be concluded, that of all modes of providing for extraordinary public expenditure, that by loan is the least disadvantageous; that it is eminently favourable to commerce; that it has a tendency to beget frugality; that it can have place only where there are wise laws, reasonable freedom, and a stable constitution; that while a nation shall continue in other respects flourishing, and *while national debt shall be contracted only for necessary defence, or public improvement*, this debt can never ruin a nation, nor embarrass its government. While we defend the *uses*, however, of the system generally, let us not be understood to defend its *abuses*. To pay the interest of the debt contracted by a very long succession of these loans, must require heavy taxes; and the weight of those taxes may at length bear too hard upon agriculture, commerce, and industry. There must be a limit to expenditure, beyond which it must cease to be beneficial; but the numberless successive predictions, that the crisis was approaching when ruin would ensue, and our wealth, power, and consequence having

survived them all, operates as a caution not to give too much credit to despondency. At the same time, Mr. Pitt's declaration from the treasury-bench, that the crisis had actually arrived, when taxation upon produce had reached its *ne plus ultra*, (and he proved the sincerity of his conviction, by demanding a portion of the principal, under the denomination of property-tax,) is sufficient to operate as a powerful admonition to those who hold the public purse. We shall conclude this article with observing, that at the commencement of the year 1822, the national funded debt of the United Kingdom stood, in round numbers, 800,000,000, the annual interest of which amounts, according to a similar mode of estimating, to 30,000,000. *See titles FUNDS, REVENUE, and SINKING FUND.*

NATRON. *See SODA.*

NATURALIZATION is when an alien-born is made the king's natural subject. Hereby an alien is put in the same state as if he had been born in the king's liegeance, except only that he is not capable of being a member of the privy council or parliament, and of holding any office or grant. No bill for a naturalization can be received in either house of parliament, without such disabling clauses in it; nor without a clause disabling the person from obtaining any immunity in trade thereby, in any foreign country, unless he shall have resided in Great Britain seven years after the commencement of the session in which he is naturalized, or restored in blood, unless he has received the sacrament within one month before bringing in of the bill, and unless he also takes the oaths of allegiance and supremacy in the presence of the parliament. 1 *Black.* 574. *See ALIEN.*

NAVAL STORES, as pig-iron, bar-iron, hemp, pitch, tar, resin, turpentine, anchors, cables, cordage, masts, yards, bowsprits, oars, oakum, ochre, sheet-copper, or other naval stores, are prohibited to be exported without leave of the privy council, under penalty of forfeiture and double the value. *See CORDAGE, and STORES OF WAR.*

NAVIGATION, the art or act of sailing, or conducting a vessel from one place to another, in its primary sense. Technically used, the term comprehends the science of constructing most advantageously; loading, and otherwise managing most judiciously; and conducting most safely, expeditiously, and commodiously, vessels to their destined situation.

LAWS RELATIVE TO NAVIGATION.

These are so multitudinous, and embrace such a prodigious number of divisions of the general subject, viz. the commerce carried on by means of navigation, as well illicit, as lawful; the vessels themselves, the registering of them, the owners, the passengers, the ma-

riners, the pilots, the merchandize, the insurance, the forfeiture, &c. &c. as renders it entirely impracticable to attempt giving even the merest elements of so diversified a science under any one head, or title, or even under any small number of such, by any arrangement of matter, however well divided or methodized: we must therefore, to avoid obscurity on the one hand, and tautology on the other, beg to refer the reader to the specific titles, under which his own judgment will direct him to look for much of the information on these separate subjects, and reserve the columns, dedicated to the illustration of this particular article, for the introduction only of those statutes which bear an immediate reference to it.

An ordinance, for the encouragement of the shipping and navigation of this nation, originated during the usurpation under the authority of Cromwell. The regulations it contained were, however, found so beneficial, that the principle of this law was adopted by the 12th Car. 2. c. 18. under the title of "An act for the encouraging and encreasing of shipping and navigation," commonly known under the denomination of "The English Navigation Act." By this statute, (explained, altered, and so modified, as to meet the fluctuating circumstances of the nation, by several subsequent statutes, especially 13 & 14 Car. 2. c. 11.—15 Car. 2. c. 7.—22 & 23 Car. 2. c. 11.—4 Geo. 3. c. 16.—19 Geo. 3. c. 48.—22 Geo. 3. c. 78.—26 Geo. 3. c. 60.—27 Geo. 3. c. 19.—34 Geo. 3. c. 68.—50 Geo. 3. c. 21.—54 Geo. 3. c. 48.—and 58 Geo. 3. c. 27.) no goods of foreign growth, production, or manufacture shall be brought into any ports of Great Britain, but in English shipping; nor shall any commodities be shipped, or brought from any places or countries, but only from those of *their growth, production, or manufacture; or from those ports where such commodities usually are first shipped for transportation*, and from no other place, under penalty of forfeiture of such goods, and the ship or vessel carrying them. Modified by 7 Ann. c. 8. as to certain articles.

No fish-victuals, wares, goods, commodities, or other things whatsoever, shall be laden on board any vessel whereof any stranger shall be owner or master, and whereof the whole of the mariners shall not be British subjects, to be carried from one port or creek of the United Kingdom, or any other port or creek thereof, on pain also of forfeiture of vessels and goods. See 10 & 11 W. 3. c. 24. s. 14. as to anchovies.

No ship shall be entitled to a certificate of registry, unless she shall be British-built; nor shall such ship be entitled to the privileges of a British-built ship, unless she be *legally navigated*, the import of which term is, that if she be a foreign trader, she shall be manned by a master, and at least *three-fourths* of her crew British subjects; and if

she be a coaster, that the master and all the mariners are British subjects, and remain so during the whole of the voyage, under penalty, in both cases, of forfeiture.

No goods or commodities of the growth, production, or manufacture of Muscovy, and no masts, timber, or boards, foreign salt, pitch, tar, rosin, hemp or flax, raisins, figs, prunes, olive oils, or any sort of corn, grain, sugar, pot-ashes, vinegar, brandy, currants, or any commodities of the growth, produce, or manufacture of Turkey, shall be imported into Great Britain, in any ship but such as belong to the people of these countries respectively, or in British-built ships, whereof the master and three-fourths of the mariners are English.

No foreign-built vessel shall be entitled to the privileges of British shipping, unless the owner thereof be a British subject; and shall make oath before the chief officer of the customs, at the port nearest to his place of abode, that such ship was *bond fide* purchased for a valuable consideration, expressing the sum, time, place, and persons, from whom the same was purchased; and the names of the persons who are part-owners thereof, all of whom shall be liable to the above-mentioned oath; and no foreigner, directly or indirectly, hath any part, share, or interest therein, and upon such oath he shall receive the usual certificate, under the hand and seal of the officer, whereby such ship or vessel shall for the future pass, and be deemed as a ship belonging to the said port; and the officer shall keep a register of such certificate, and return a duplicate thereof to the chief officers of the customs of London. Commodities of the Straights and Levant seas, and India goods laden in English shipping, from the usual places of loading them, to the southward and eastward of the Cape of Good Hope, navigated by a master and three-fourths of the mariners British subjects, may be imported, although loaded from places not of the very growth, &c. of such imported produce. See 6 Geo. 1. c. 14.

British subjects may also import in ships lawfully navigated from Spain or Portugal, the Azores, Madeira, or Canary islands, all goods of the growth, produce, or manufacture of those countries.

No sugars, tobacco, cotton-wool, indigo, ginger, fustic, or other dyeing woods, of the growth, produce, or manufacture of the English plantations in Asia, Africa, or America, shall be shipped or transported to any place or port except from some one of the English plantations to another, or to some British port direct, under penalty of forfeiture of ship and cargo.

Merchants loading ships for any of the British plantations abroad, shall give bond and surety to the chief officer of the customs of the port whence such vessel shall sail, or to the governors of any foreign planta-

tion, that the regulations contained in these acts relative to the direct importation or exportation of goods between Great Britain and her colonies, shall be strictly complied with, under penalty of forfeiture of such bond, and of the cargo and vessel so illegally laden and transported. See 7 & 8 Wm. 3. c. 22. — and 8 Ann. c. 16.

No ship shall be more than three days coming from Gravesend to her port of discharge, unless hindered by contrary winds or other accident.

No ship to clear inwards or outwards, without making the proper entries at the custom-house, under penalty of search by the officers of the customs, who may seize all such prohibited or uncustomed goods as may be found on board.

No goods shall be imported or exported to or from the British plantations in Asia, Africa, or America, except in British bottoms belonging to the said plantations, and whereof the master and three-fourths of the mariners are British subjects, under penalty of forfeiture of the vessel and cargo.

No foreigner shall exercise the trade of a merchant or factor in any of the plantations, under penalty of forfeiture of his goods and chattels.

The lords of the treasury, and commissioners of the customs, are empowered to appoint custom-house-officers in all port-towns in the plantations.

Governors, appointed by the proprietors of any colony, must be approved by the crown, and take the oaths of office before they enter upon their respective governments. See 7 & 8 W. 3. c. 22.

Foreigners inhabiting any British plantations for seven years, must be deemed British subjects, on taking the oaths and receiving the sacrament; or if they are Quakers, they make their affirmation; and if Jews, they may leave out the words "*on the faith of a Christian*," &c. in such oaths.

Persons importing from the plantations any wood, plank, timber, &c. wrought or unwrought, may import the same, free of all duties.

The produce of the British plantations are as follows, viz. rice, pitch, tar, turpentine, train-oil, whale-fins, sugar, molasses, rum, ginger, tobacco, indigo, pimento, cocoa or chocolate, nuts, drugs, balms, deer and other skins, furs, masts, yards, rosin, logwood, fustic, walnut-tree, mahogany, manchineel, cedar, citron-water, raw silk, pig-iron, potashes, aloes, Peruvian bark, tortoise-shell, bullion and foreign coin, tamarinds, coffee, horn, sarsaparilla, snake-root, and cochineal.

By several statutes passed in the year 1822, our navigation laws have been materially altered. By the first of these statutes, 3 Geo. 4. c. 41., the provisions of various acts of parliament, prior to the reign of Charles the Second, relating principally to the importa-

tion and exportation of different articles, and the enumeration of which acts occupy eighteen pages of the quarto edition of the statutes, are all repealed.

By 3 Geo. 4. c. 42. (reciting that it is expedient to repeal certain provisions, relating to the countries from whence, and the ships in which goods and merchandise shall be imported into any part of the United Kingdom, in order that other regulations might be declared concerning the same,) so much of the 12 Car. 2. c. 18. as relates to the importation of goods of Asia, Africa, and America, in British ships only, is repealed. s. 1.

By the 2d section, so much of the 12 Car. 2., whereby it is enacted, that no goods or commodities of foreign growth or manufacture, which are to be brought into Great Britain in English-built shipping, navigated by English mariners, shall be shipped or brought from any place or country, but from those of the said growth or manufacture, or from those ports where the said goods and commodities can only be, or are usually shipped for transportation, is repealed.

The 3d and 4th sections repeal parts of 12 Car. 2. which relate to the importation of Russian and Turkish goods, and goods of Spain, &c.

The 5th section repeals the corresponding parts of 27 Geo. 3. c. 23. (I.) which extended the 12 Car. 2. to Ireland.

The 6th section repeals so much of the 13 & 14 Car. 2. as prohibits the importation of any sort of wine (other than *Rhenish*) spicery, grocery, tobacco, pot-ashes, pitch, tar, salt, rosin, deal boards, fir timber, or olive oil, from the Netherlands or Germany.

The 7th section repeals so much of the 13 & 14 Car. 2. as excludes foreign-built ships, manned and owned by English, from the privileges of British ships.

The rest of the act repeals parts of different acts of parliament, which, since 12 Car. 2. have from time to time been passed, and relate to the importation of particular articles from certain places.

We now come to what may, in contradistinction to these repealing statutes, be called the enacting act on this subject, namely, 3 Geo. 4. c. 43. By section 1. of this act, goods of Asia, Africa, and America, shall be imported into the United Kingdom, from any place whatever, in British-built ships, or ships entitled to the privileges of British-built ships only, under penalty of forfeiture, &c. except as otherwise specially provided for.

By section 2. all such goods imported into the United Kingdom from any place in Europe, shall be imported for exportation only, except in cases otherwise specially provided.

Sections 3. 4. & 5. allow the direct importation of goods of Spanish America, and the Spanish West Indies, from place of growth, in ships of the country, under certain provisoes, and whilst equal privileges are granted to British ships by those places.

By section 6. certain enumerated European goods may be imported in British ships, or in ships of the country or port of export in Europe only.

Section 7. provides that other goods or merchandize the growth or manufacture of Europe, may be imported in any ship, or from any place whatsoever, as heretofore.

Section 8. The products of the Turkish dominions may be imported in British vessels, or in vessels of the built of any place within the dominions of the Grand Seignior, wholly owned by the people of such place, and navigated by a master and three-fourths, at least, of the mariners thereof of such place, and such goods may be imported for consumption in the United Kingdom.

Section 9. Raw silk and mohair yarn of Asia, exported from the Turkish dominions, and from Malta and Gibraltar, and also all goods of Morocco imported into Gibraltar directly from any part of the dominions of the Emperor of Morocco, not to the southward of Mogadore, in British ships, and also all diamonds and jewels from any place whatever, may be imported in British ships, for consumption in the United Kingdom; and all such diamonds shall pass inwards without warrant or fee.

Section 10. The Island of Malta and its dependencies is deemed and taken, for all purposes whatever, to be in Europe.

Section 11. Ships registered as British ships before the 1st May 1786, may, on warrant of the Treasury, be registered and privileged as British-built ships.

Section 12. British-built ships sold to foreigners shall be deemed to be foreign ships, of the country of the purchasers, if in Europe; but such, although they again become the property of a British subject, shall not be deemed British ships again, otherwise than by capture and legal condemnation.

Section 13. provides that nothing in this act shall repeal such part of 12 Car. 2. as relates to bullion, or to goods taken by way of reprisal.

Section 14. enacts that the act shall not affect the acts regulating the intercourse between Great Britain and Ireland. 39 & 40 Geo. 3. c. 67. 40 Geo. 3. (1.)

By section 17. this act is not to repeal the American trade acts, 49 Geo. 3. c. 59. and 59 Geo. 3. c. 54., but those acts, however, are not to restrain the importation from the United States in British ships.

There are also provisos for the Portuguese trade acts, the acts regulating the trade with the East Indies, and for other acts of the same nature.

By chapters 44 & 45. of 3 Geo. 4. very important alterations are made in the laws regulating the trade of the British colonies. The first of these acts regulates the trade between his majesty's possessions in America and the West Indies, and other places in America and the West Indies. The 1st sec-

tion of this statute repeals about 26 acts of parliament on this subject.

By section 3. it is enacted, that the articles mentioned in schedule B. annexed to the act, may be imported from any foreign country on the continent of North or South America, or from any foreign island in the West Indies, into the ports mentioned in schedule A. of the act, either in British ships, or in ships of the country, of the growth, &c. provided that if imported in foreign, &c. ships, they be shipped *direct* from the place of the growth, &c.

By section 4. of the same act, it is lawful to export, in any British ship, &c., or in any such foreign, &c. ship, &c. as mentioned in the 3d section, from any of the ports enumerated in schedule A. of the act, any article of the growth, produce, or manufacture of any of his majesty's dominions, or any other article legally imported into the said ports, provided that the said articles, when exported in any such foreign, &c. ship, shall be exported direct to the country or state in America, or the West Indies, to which such ship or vessel belongs as aforesaid, and on certain bonds and securities, &c. &c. being given.

The 5th section provides, that for ten years from the passing of the act, foreign vessels which have been engaged in lawful trade with the said colonies before the act, shall not be excluded from the trade allowed by the act, by reason of their not being of the built of the country to which they belong.

Section 14. allows any article enumerated in schedule B. legally imported under the act, to be exported in any British ship, owned and navigated according to law, to any other British island, colony, or plantation in America or the West Indies, provided that upon the importation thereof into any such other British island, &c., proof shall be produced that the duties have been first paid in the colony into which the articles have been first imported; and every article so imported, shall be allowed to be exported to any part of the United Kingdom, under the rules and restrictions of 12 Car. 2. c. 18. 22 & 23 Car. 2. c. 26., & 20 Geo. 3. c. 10.

Section 15. reciting it to be the intention of the act that the privileges thereby granted to foreign ships shall be confined to the ships of such countries as give like privileges to British ships in their ports in America and the West Indies, enacts that his Majesty may, by order in council, prohibit trade and intercourse under the authority of this act, with any country in America or the West Indies, if the privileges thereby granted to foreign ships are not allowed to British ships trading to and from such country.

The principal remaining part of the act regulates the details of the trade.

Statute 3 Geo. 4. c. 45. regulates the trade between his majesty's possessions in America and the West Indies, and other parts of the world.

Section 1. of this statute, repeals various old statutes on the subject.

Section 2. allows the exportation from any of the said colonies, &c. in any British-built ship, &c. owned, &c. any articles, the growth, produce, or manufacture of the colonies, &c. or which have been legally imported into the colonies, &c. direct to any foreign port in Europe, or in Africa, or to Gibraltar, Malta, Guernsey, Jersey, Alderney, or Sark.

Section 3. enacts that such articles shall be entered and shipped in the presence of the officers of customs, and within the limits of a port where a custom-house is established; but nothing in this act shall alter the existing regulations for lading and shipping the produce of the fisheries of the said colonies, &c.

Section 4. provides that goods not agreeing with the entry, or shipped without entry being made, shall be forfeited, and the owner shall forfeit double their value.

Section 5. prohibits ships clearing out from the colonies from taking on board any other articles than such as are allowed to be on board and exported by this act, on pain of forfeiture, and the master and shipper of such goods to forfeit double the value.

Section 8. allows the exportation in any British-built ship, &c. owned, &c. from any foreign port in Europe, or in Africa, or from Gibraltar, &c. &c. &c. (as in 2d section,) to any of his majesty's colonies, plantations, or islands, in America or the West Indies, the articles enumerated or described in the schedule A. annexed to the act.

The four subsequent sections of this statute regulate the duties to be paid on the articles upon importation into the colonies; the appropriation of the net proceeds of such duties in colonies where there are no general courts or assemblies, and the mode of ascertaining the value of such articles as are subjected to an *ad valorem* duty.

Section 13. provides that if any imported article charged with duty by this act, be also liable to the payment of colonial duties, of an equal or greater amount, then the duties imposed by this act shall not be payable on such articles; but if the colonial duty be less, then the difference only between the amount of the duty payable by this act and the colonial duty, shall be collected.

Section 16. enacts that any person prosecuted under this act, may plead the general issue, and give this act and the special matter in evidence; and if a verdict shall pass against the prosecutor, then the defendant shall have treble costs.

For other details of the regulations of the trade, &c. the reader is referred to the act.

On the subject of navigation, generally, little more remains to be added, but the substance of a few decisions of the courts on points relating to, or immediately arising out of, the navigation acts.

Importation and Exportation. — It has

been repeatedly held, that a ship merely coming within the limits of a port, by stress of weather, or other such cause, *without any intention to break bulk*, is not an importation within any of the navigation laws, either to raise a claim for custom dues, or to occasion any forfeiture. *Reeves, 2d. edit. p. 198. 200.*

So respecting exportation also, it has been decided, that goods shipped cannot be considered as exported, until the ship has cleared the limits of the port. *Attorney General v. Pougett, E. 1816.*

British Subjects. — Information *qui tam* in exchequer, by one *Scot*, setting forth that he had seized the ship *Constant* in the port of London, as forfeited, because the ship was not belonging to the people of Great Britain, as the true owners, the master and three-fourths of the mariners not being English, nor the built of the country of which the goods were the growth, product, or manufacture. The port where such goods only can be, or are most usually first shipped for transportation, and whose master and three-fourths of the mariners, at least, were of that country or place, whereby, &c. &c.

A special verdict found, that the ship was Russia built, and set sail from Riga for London with the goods in the information, which were the product of that country, that the ship was Russia-built, that the master was born out of the dominions of the empress of Russia, but has been admitted a burgher of Riga, and has continued to reside there several years, and traded from thence nine years before the seizure; that there were eleven mariners on board, of whom four were born in Russia, that a fifth was born in Ireland, and there bound apprentice to the master, and went with him to Riga, and sailed with him the present and several former voyages; that the other six mariners were born out of the dominions of Russia, but had resided at Riga, each several years; and that Riga is a port where the goods seized can only be, or most usually are, first shipped for transportation.

Question was, whether the ship and goods were forfeited under navigation acts? in other words, whether the words of exception (*printed in italicks*) extend to the whole of the prohibitions in the clause, or only to the second branch of them? which resolved itself into the question, whether, under these circumstances, the ship was manned with mariners according to the provisions of the act.

Judgment was given for the defendant, on the ground that the navigation acts only require, that a specific number of the mariners should be *of the country*, not that they must necessarily be *natives of it*. Their residence, &c. within the dominions of Russia, imposed on them at least a local allegiance; and as no man can be born a mariner, and these men were mariners of Russia at the time of the voyage, and long before, and never were mariners of any other country,

they were sufficiently mariners of the countries of which the goods shipped were the produce, &c. &c.

After *M. T. 1738. Com. Rep.*

Information *qui tam* by *Scot v. A'Chez*, special verdict found, that the ship in question, the Sea-horse, laden with wine and vinegar, was *English-built*, that it was taken by a Spanish privateer, we being at war with that nation, and condemned as prize; that it was then regularly sold to a French subject residing in France, and became French property; the wines and vinegar were *the growth, &c. of France*, and were imported from *Bordeaux* in France, to Great Britain, the said ship continuing French property; that the master of the ship and three-fourths of the mariners, at the time of the importation, were Frenchmen.

The question here was, whether this ship was under the words of exception in the navigation act.

The court decided, that the construction of the navigation act was this. It prohibited the importation of goods of the growth of any European country, except in ships owned and navigated by the *English*, or in ships of the *built of*, and manned by sailors of that country of which the goods were the growth; and gave judgment for plaintiff.

After *T. T. 1748. Parker's Rep. See further, titles INSURANCE, MANIFEST, REGISTRY, SHIPPING.*

NAVIGATION, Inland. The utility of inland navigation seems now to be universally admitted; for canals necessarily facilitate the communication between one part of the country, and another, reduce the price of carriage, and enable the husbandman, and the manufacturer, to send their goods cheaper to market. The ancients were aware of these advantages; and even in Greece, where, from the country being peninsulated by the sea, canals were not much wanted, Herodotus tells us, an attempt was made to dig a channel through the isthmus which joins the Peloponnesus to Greece; and we also find from Strabo, that in Bæotia canals were cut to carry off the water from lands which were overflowed. The aqueducts of the Romans were a species of canal, and they had also many for draining the water from overflowed grounds.

Egypt contained from the remotest antiquity a number of canals dug to receive and distribute the waters of the Nile at the time of the inundation; but the great project of a canal to communicate between the Nile and the Red Sea, deserves more particular attention. It was, as we are told by Diodorus Siculus, begun by Necos, and continued by Darius, but laid aside from a fear that it would lay Egypt under water. Ptolemy the second, however, completed the undertaking, and caused to be constructed a dam, or sluice, which opened to give a passage and immediately closed again; this

canal was four days' journey in length. By means of it the rich commodities of India, Persia, Arabia, and the coast of Africa, were conveyed from the Red Sea to the Nile, down that river to Alexandria, and thence shipped to the various parts of Europe. After the reign of Ptolemy, this canal seems to have been neglected, but was again opened by one of the Califs in 635; and again neglected, so that some traces of it alone remain. The canal of Alexandria, or, as the Arabs call it, of Faoua, has had better fortune, it was cut from a place now called Rhamanic to Alexandria, with intent to supply that city with water. There was also a canal from Alexandria to Canopus, as well as several others.

China has for a long series of years been famous for canals; scarcely a town or a village, that is not washed by the sea or a river, being without. The royal canal is one of the most wonderful works of art: it employed thirty thousand men for the space of forty-three years to complete it. The length from south to north, extending from the city of Canton to the northern boundary of the empire, is between eight and nine hundred miles, the breadth is fifty feet, and the depth nine feet; it can consequently take vessels of considerable burthen—some of which have sails, others oars, and others are towed. It passes forty-one large cities, and innumerable canals are cut into it, to connect it with the rivers, lakes, and rivulets of the country. These canals are of the utmost benefit to China; and they are finished and maintained in a very complete manner; the quays are all faced with freestone, the bridges over it are innumerable, and have some three, some five or more arches, the centre of which is lofty, to permit barges, or vessels with masts, to pass under. We are assured that there is a passage by canals almost from one end of the empire to the other, for the length of eighteen hundred miles. In short the canals are the roads of China.

Nor are other parts of Asia without these great conveniences, the countries between Delhi and the Pansiat, in Hindostan, are supplied with water by a canal, which also answers the purposes of navigation; and Major Rennell mentions several other canals, one of which, from the river Jumma, is divided into seven streams.

Let us now turn to Europe, and we shall find that Russia, although much more backward in civilization than most of the other European kingdoms, has, however, been very active in this species of improvement.

Peter the Great formed the plan of an inland navigation from Persia to Petersburg, the new city he had just founded. The goods were to be brought by the Caspian Sea to the Astrachan, from thence by the river Wolga, and a line of canals, into the river Mesta and the lake of Novogorod,

thence into the lake of Ladoga and the river Neva to Petersburg, a distance of four hundred and fifty miles. He also planned a navigation from the Don to the Wolga, and another canal to the river Occa, and thus to effect a navigation to Moscow, and afterwards a line of communication to Archangel, the completion of which was prevented by his death. He employed an Englishman, Captain Perry, as his engineer, who met with great opposition from the nobles or boyars. The Czar's death stopped the works for a time, but they have most of them, with some improvements, been carried on by his successors. The convenience for inland navigation in Russia is wonderful, it being possible to convey goods by water near four thousand five hundred miles with only one interruption of about sixty miles; this length is from the frontiers of China to Petersburg. Also from Astrachan to Petersburg by a line of water navigation, one thousand four hundred miles, and upwards. Russia has several other canals, but of less length.

Sweden has long enjoyed canal navigation, and Denmark has occasionally laid the whole trade of Europe, with the Baltic, under contribution, by means of the canal of Holstein.

The canals of Holland are out of number. The several provinces are intersected with innumerable ones, which serve for roads and public highways, and on these the Dutch are constantly journeying, and conveying commodities from one place to another. Nor are they, in this mode of conveyance, confined to their own country, for they have also water communications with many parts of France, Flanders, and Germany. The yearly profit of these canals is immense; and Mr. Phillips, in his *History of Inland Navigation*, says, that one distance of forty miles, the annual profit is 250,000*l.* which is 62*½* *l.* per mile. The canals of Ostend, Ghent, Antwerp, Brussels, &c. communicate with the Dutch canals, and now that they are all comprehended under one government, the advantages must be incalculable.

France has canals of considerable consequence. The canal of Burgundy, which forms a communication between the Loire and the Seine. The canal of Orleans, which joins this canal. The canal of Bourbon, intended to effect a communication between Paris and the river Oise. A great number of other canals are in France, and their emperor planned many additional ones; but the great and really superb work is that of Languedoc, or the canal of the two seas, which forms a junction between the Ocean and the Mediterranean.

It does honour to the Minister Colbert, who patronised, and to Riquet, the engineer who conducted the work. It was begun in 1666, and finished in fifteen years, has on it one hundred and fourteen locks,

and is conveyèd over bridges of vast height, which give passage to rivers under them. It has also a tunnel to convey it under a mountain, which, as it was the first of the kind of any magnitude, was looked on as a most extraordinary undertaking. This work cost about half a million sterling, of which the king gave one half, and the province paid the remainder. This canal begins at Certe, and passes to the town of Agde, where there is a bason with three openings, of three different depths of water, the gates so contrived that the master of the vessel may open which he pleases. There are near Beziers, and also near the tunnel, eight locks, together forming a grand and regular cascade 960 feet long, by which the vessels cross the river Orb. At St. Ferriol is a reservoir which covers 590 acres, with passages for the water into the bason of Panouf, which is the highest level, and is embanked and walled round with stone. The canal then descends, passing many towns into the Gardane, a little below Toulouse. The breadth is 144 feet, including the towing paths, the depth six feet, and the length 64 French leagues. The highest part is 600 feet above the lowest level.

In Spain, the canal of Arragon was begun in 1781: it consists, in fact, of two canals, both of which begin at Navarre, and run through Arragon, and at length fall into the Ebro. These works have been effected by labours deserving of admiration: besides dykes, banks, sluices, &c. where necessary, there is an aqueduct 710 fathoms in length, in which this canal runs. They have also other canals, but of less note; and if the ministers of Spain come to attend to commercial improvements at home, when colonial projects shall have ceased to engross their exertions, there can be little doubt but that their number will increase.

Let us now turn to our own country. There we find the vestige of a canal, now called Caerdyke, which seems to have been cut from the river Hyne, near Peterborough to the river Witham, near Lincoln, and most probably with intention to join those rivers. It was forty miles in length, but is nearly filled up: and whether cut by the Romans, or Danes, is uncertain. Except this, no great attempt was made at canal navigation in England, till towards the middle of the last century. Factitious navigations were possibly thought less necessary; as several of our rivers had, by art, been rendered navigable much further than they were by nature.

About the period before mentioned, however, our countrymen began to turn their thoughts to this great object; and fortunately, at the same time there lived one of those wonderful geniuses which seldom appear; and, by a happy concurrence of circumstances, a spirited young nobleman, just come to the possession of a good estate, and inclined to patronize him.

This man was the justly celebrated Mr. James Brindly, and his patron was the Duke of Bridgwater. Mr. Brindly considered, that although the four great rivers of England, the Thames, the Trent, the Mersey, and the Severn, extend far into the country; yet the four great ports of the kingdom situated on these rivers, viz. London, Bristol, Liverpool, and Hull, had no communication by water with each other, except by a navigation, circuitous, always tedious, and in winter extremely dangerous. Mr. Brindly formed a plan to unite them, and private interest has led the way to the completion of this truly great and national undertaking.

Justice requires that we should give some account of the very singular man who planned, and laid the first foundation of, these great works. He was born at Tunsted, in Derbyshire, in 1716. His father possessed a little freehold, which he dissipated by a fondness for shooting, and other field sports; in consequence of which, his son's education was totally neglected; and, to support the family, he was employed in such kind of labour as his strength would permit. At the age of seventeen he bound himself apprentice to a millwright of the name of Barnart, near Macclesfield, in Cheshire, when he quickly discovered an attachment to the mechanical arts in general, and a genius formed for extending them. In the early part of his apprenticeship he was often left by himself for weeks together, to execute works, for which his master had given him no previous instruction. These works he, of course, finished in his own way; and his master was often surprised at the improvements he from time to time introduced into the millwright business; and the millers, seeing his ingenuity, generally chose to have him employed on their work. In short, his attention and application supported his master (who was very old) and his family with comfort. One singular instance of his application deserves notice. His master was engaged to build an engine paper-mill, which was the first of the kind attempted in these parts. He went to see one, but when he came to work at it he was not able to complete it. Brindly, without mentioning his design, set out on the Saturday evening after he had finished his business, travelled to the place where a mill of that kind was to be seen, took a view of it, and returned back in time to his work on Monday morning, having travelled fifty miles on foot. He then informed his master in what he was deficient, and the mill was completed to satisfaction. He afterwards engaged in business on his own account, and brought forward many useful inventions and contrivances, so that he acquired the character of a most ingenious mechanic, and was called to work at many distant places. In 1752 he erected an extraordinary water-engine at Clifton, in Lancashire, for draining coal-mines. In

1755 he was employed to make and erect the large wheels for the silk-mill at Congleton, in Cheshire, all which he executed with the most consummate skill, and invented many useful machines to further this business. He also made some valuable additions to the potters' mill for grinding flint-stone; and in 1756 he undertook to erect a steam-engine on a new plan at Newcastle-under-Lyne. His inventive genius also displayed itself in many other ingenious inventions and improvements.

He was soon called to another object, the projecting and executing inland navigation; and in this we shall see this great mechanic's powers exerted in the production of some extraordinary events. This he did under the protection of the nobleman above-mentioned, who had the discernment to single him out, and the steadiness to support him against the opinion of those who treated Mr. Brindly's plan as chimerical.

The duke had, at Worsley, about seven miles from Manchester, a large estate, rich in coal, which had hitherto been useless, on account of the expense of land-carriage, which would have rendered them too dear for the market. The duke, wishing to work these mines, saw the necessity of a water-carriage, and, on consulting Mr. Brindly, the latter surveyed the ground, and declared the scheme to be practicable. The duke therefore resolved to effect his plan, and they thus had the joint honour and satisfaction of having first introduced canal navigation into this kingdom.

Having fixed in his mind the plan, and his surveyor, having also completed his, he, in the year 1758, the thirty-second year of the reign of George the Second, obtained an act to make a navigable cut or canal from the township of Salford to or near the Worsley Mill and Middlewood, and to a place called Hollen's Ferry, in the county of Lancaster; and being thus legally authorized, began his work.

The first design of this intended canal was to convey coals from the duke's mine on his estate at Worsley to Manchester, but his views enlarged as he advanced in the work. He began to cut therefore at a place called Worsley Mill, about seven computed miles from Manchester; when he first excavated a bason capable of holding not only all his boats, but a great body of water to serve as a reservoir, or head of his navigation. The coals are dug from a hill adjoining, to which works a subterraneous passage is cut large enough for the admission of flat-bottomed boats, for three quarters of a mile, which are towed by hand-rails. At the distance of three quarters of a mile from the entrance, the passage divides into two channels, which have been far extended.

This passage being a curious and interesting work of art, we shall describe it:—In some places it is cut through the solid rock,

and in others arched with brick. There are several air-tunnels cut through near forty yards deep, at certain distances, to give air: the entrance is six feet wide, and about five feet high above the water; it widens in some places for boats to pass. The coals are brought to the boats in low carriages, and as the passage is on a descent, although they hold a ton each, they are easily drawn along by men, on a railed way, to a stage over the canal, and then shot into the boats. These boats, which contain about seven tons each, are easily drawn out of the passage, where two, three, or more, are linked together, and drawn by horses or mules to the place of their destination.

The canal is in some places carried over the roads on arches, and in places where the arch is not high enough for carriages to pass, the road has been sunk, at a great expence, for the convenience of the passage. But the most stupendous work on this canal is the bridge, and aqueduct, over the river Irwell. At Barton-bridge, three miles from the bason, is an aqueduct which conveys the canal over a valley for two hundred yards, and over the navigable river Irwell above 40 feet higher than the level of the river. The canal is carried over the meadows on each side of the Mersey, and over a place called Saltmoor, at an incredible expence. Mr. Brindly proceeded thus: he caused trenches to be made, and then placed deal balks upright, so as to back and support each other, supporting them by other balks, laid horizontally in rows, and secured together; thousands of oak piles were driven in between them; he then threw in the proper quantity of earth and clay, and caused it to be well rammed in. Having thus completed about forty yards, he removed his balks and proceeded again. The bridge over the Irwell is of stone, and has three arches all of hewn stone: the centre-arch is sixty-three feet wide, and will admit barges to pass through with their sails standing. The river Medlock is raised, and supplies the canal with water by means of a fine wear constructed in a curious manner.

The ingenuity displayed by Mr. Brindly through the whole of this work is surprising. H.'s smiths' forges, his carpenters' and his masons' workshops, were covered barges, which floated on the canal, and followed the work as it advanced. The duke had one great advantage, having all the necessary materials, timber, stone, lime, and coals, taken from his own estate.

In the session of parliament, 1758-9, the duke obtained an act to make a navigable canal from Worsley to Salford, near Manchester, and to carry the same to Hollen's Ferry; but after he had completed the canal from Worsley to the highway between Warrington and Manchester, it was discovered that it would be more beneficial to carry it over the Irwell, and to extend it to

Longford-bridge. An act was obtained for that purpose.

On a further survey it was discovered that it was practicable to extend the canal from Longford-bridge to a place on the river Mersey, called the Hempstones; a third act was obtained. The whole navigation was then proceeded on and completed, being more than twenty-nine miles in length, and having, at its fall into the Mersey, locks which let boats down ninety-five feet; for it is so contrived as to be on a level the whole length to that place. It may be proper to remark, that the locks were formed at Runcorn, instead of the Hempstones.

We cannot conclude this account of the duke's undertaking, without observing, that it has a variety of good effects. The price of carriage of goods of all kinds, and of coals for the manufactories of Manchester, are very considerably reduced: the value of all the estates contiguous to the canal is considerably increased, and the Duke of Bridgewater was recompensed by a princely addition to his fortune.

The duke having thus led the way, several other plans for navigable canals were immediately brought forward, and the success which attended the first essay prompted many to undertake the like works. Gentlemen naturally concluded that every thing, which caused a ready communication between one place and another, would increase the value of their estates, and the manufacturer reasoned in the same way, with respect to the fall of his raw material. In Staffordshire, in a part of that county near Newcastle, there are several towns near each other, where the coarse earthen-ware then in use was manufactured, and which spot is, from that circumstance, called the Pottery. The inhabitants of this part clearly saw the advantages inland navigation promised to them, and readily joined in subscribing money, and projecting such a work.

A public meeting was called at Sandon, near Stone, in Staffordshire, at which several noblemen, with many of the neighbouring gentlemen, and persons concerned in the manufactories, attended. Among the latter was Mr. Wedgwood, then in a small way of business in the Pottery. That gentleman had too much good sense not to see that such an undertaking opened the way for attaining that wealth and independence which his family have since accomplished. Mr. Brindly, as we have already observed, had planned originally the great design of uniting the four great trading towns of England, London, Bristol, Hull, and Liverpool, by means of navigable canals. He was now again selected for the purpose of carrying into execution this portion of his original plan, which was to connect the rivers Trent and Mersey, to make another survey, which he did, in conjunction with Mr.

Smeaton, and they both reported that the country was most admirably calculated for the purpose.

Their plans were laid before this meeting; but some difficulties being started, other surveys were advised, which were presented to a second meeting. The gentlemen who proposed to be subscribers approved of Mr. Brindly's, at an adjourned meeting held at Wolseley-bridge, Staffordshire, on the 30th Dec. 1765.

This meeting was attended by Earl Gower, the lord-lieutenant of the county, in the chair; the two county members, and those for Litchfield, Newcastle in Staffordshire, and several other places. Here they came to the following resolutions:

1. To apply to parliament for leave to make a navigable canal from Wilden, in the county of Derby, to the river Mersey.

2. To complete it on Mr. Brindly's plan.

3. To raise 101,000*l.* in shares of 200*l.* each, and to open subscription books at the great towns near which it was to pass.

On this occasion, remarks on the advantages of canal navigation in general were set forth in a work attributed to Mr. Wedgwood, and especially on the peculiar advantages of the line taken by this canal. Some few of these, as well as extracts from the clauses of the act, (as this has served, with some alteration, as a foundation for all future canal acts,) we shall take the liberty of giving.

"The advantages attending navigable canals," observes the writer, "are great. Every person must allow that the stamina of our trade is the internal produce of the kingdom, and that the nearer the manufacturer is to the market, the better price his goods will bring him. For instance, if a person manufacture a piece of cloth forty or fifty miles from the part where it is to be shipped, he must abate in his price the value it will cost to carry it by land carriage to the market; but the opening a water navigation will lessen the expense, and either enable him to sell his work cheaper, which is a national benefit, or give him more profit, which is a private advantage.

"In case of invasion, government will, by these canals, be enabled to transport the heaviest cannon to any part of the country in a very short time; regiments also, and their baggage, may be conveyed in a safer and more commodious way than by long harassing marches, through roads often impassable, and oftentimes circuitous. The saving in draught-horses and the expense of baggage-waggons will be great.

"It has been objected that an inland navigation will destroy the breed of draught-horses, since there will be little or no employ for them; to this it may be replied, that the number of horses should be decreased; but there can be no danger of

their destruction; and the land saved from the growing of produce for the horses will feed thousands of poor families.

"Nothing requires the attention of the people of this country more than husbandry: this will receive great advantages from these canals; the farmer will be able to send his corn to market at any time of the year, and this easy conveyance from one place to another will tend to bring it to a greater equality of price throughout the kingdom, and by this means that first necessary of life will be kept nearer a medium. If corn and other provisions be kept low, the manufacturers will be able to work cheaper, and sell more of their manufactures. Another advantage which will arise to the farmer will be, that, instead of employing his team in sending corn to market, he may transmit it by the canal, and his horses, mean time, may be employed in improving his land, by carrying marle and manure to it: and he might inclose and till more lands, which are now waste grounds and commons. How greatly would agriculture be improved, and the increase and produce of our land fulfil the proverb of returning tenfold, and the shepherd made happy by the increase of his sheep. I cannot omit mentioning, before I conclude, the enumeration of these general advantages, that prodigious and immense convenience, that the merchants at the three ports will receive, from being able to send their merchandise by this canal from Bristol to Hull; which is in fact joining the east and west together, by which means they will both avoid that most tedious and hazardous voyage of two months round the land's end, and also the expense attending those dangerous voyages, and find themselves considerable gainers.

Let us not omit too one very great and material advantage that inland navigation is of in keeping, through a whole country, an equimediate price of provisions; for, where any commodity is cheap at home, it may be carried to a more populous part to get a proper price for it, and when it is dear at home, it may be fetched from a cheaper market, and the poor will never be so liable to suffer by monopolizers.

"The great advantage that this kingdom will derive from a less number of horses being kept for draught is prodigious, as the same lands that kept twenty thousand horses will, perhaps, now keep thirty thousand fat oxen; by which means butchers' meat will be always cheaper to the labouring poor, as well as to the labouring manufacturer; all which articles are very considerable, and of material moment in the price of our manufactures, as they, in a great measure, work their trade to rise and fall in price according to the cheapness of their materials and the necessities of life.

"Inland navigation will encourage old manufacturers to work with fresh vigour,

when they can obtain their materials cheap; and will give opportunity to set up new trades and manufactures, as the materials may be conveyed to any part of the country whatever.

"There are many large mines of valuable contents, that for want of carriage and conveyance are now useless; such as stones, iron ore, marble, and quarries of various sorts, that would then be opened and worked, and be productive, perhaps, of the greatest advantages to the proprietor, as well as to the various parts of the kingdom, in which they might be purchased at an easy rate.

"The coasting trade seems to claim mention of the great advantages that will accrue to it by these navigable canals, as all or most of the goods that have usually gone by land-carriage from London to these countries, will now be sent by the shipping to the ports, and from thence be dispersed far and wide by means of these navigable canals; for the more you open a channel, the more water it draws from the head, and consequently works its way farther on.

"They will certainly cause more shipping to be employed on the coasts, and more sailors to navigate them. I must here make one observation, that old men and worn-out sailors may be employed on these navigable canals; and those whose constitution will not suffer them to undergo the hardships and severities of a sea voyage, yet may do very well to navigate these vessels on the canals; every boy in each village through which the canals pass, will have a desire to become a sailor, and will be trained up in his early youth to hand a rope, and soon be fit to be of service on board a ship; by which means these canals will become one of the most natural nurseries for seamen for his majesty's fleets and the protection of this island; as also for shipwrights upon an emergency; both which are great advantages to any state.

"These canals will be of great advantage to the landed estates, as more persons will now come and settle themselves on many commons adjacent to the navigation for the benefit and convenience of trade, and thereby improve and inclose those barren lands; and the present inclosed lands will reap great benefit, either by draining some that want it, or flooding others, which is reckoned a great improvement to meadow lands.

"The result of every plan and scheme for the public service should ultimately terminate in giving assistance to the distresses of the poor, and relieving their wants by letting them have the necessaries of life at a cheap rate; this I term charity to our brother. This is the true strength of our trade, and a principal security for our present and future affluence.

"It is impossible that the immense advantages that will accrue to this nation, in a

variety of instances, from inland navigation, should be enumerated by one pen; let us, therefore, proceed to point out some *local* advantages to the manufactures only bordering on these canals.

"The line of this canal is from the Mersey into the Duke of Bridgewater's canal at Preston, from whence it runs past Northwich, Middlewich, Sandbach, Lawson, Burslem, Newcastle, Stoke, Trentham, Stone, Sandon, Haywood, Wolsley, Wickner, Burton, to the Trent at Weldin. The price of land carriage in the neighbourhood of these towns is, upon an average, nine shillings per ton for ten miles; the charge on the canal will not exceed two shillings and sixpence, a saving which will alone enable the landholders to carry many things to market which are now useless. From Northwich to Lawson is a bed of rock salt, forty yards thick. Near the latter place is a mountain, containing four kinds of different useful stone. Near Wolsley-bridge is stone not at all inferior to Portland. Near Rudgley is coal, called cannel coal, and near the place where the canal joins the Trent is a vast mountain of lime-stone, and lime-stone in various other places; and not far distant, quarries of slate. Marle and other manure may be conveyed with great advantage to the land in the neighbourhood. Iron, stone, copper, calamine, marble, white clay, &c. are all found at no very considerable distance from the line. Of manufactures and cultivated articles are timber, cord, wood for charcoal and iron works, oak, bark, wood, madder, hides, tallow, and provisions of all kinds, the ale of Burton, the manufactories of the pottery of Nottingham, Leicester, and Derby, the flour and clay to make the pottery ware, and the groceries to serve the towns on the line, will all be brought for near one-fourth the expense of carriage which they have hitherto been carried at."

Of the advantages in his contemplation, it will probably be thought this author, whoever he might be, has exhibited a luminous account; but he has not met with argument the only solid objection to the multiplication of these inland conveyances, which arises from a doubt whether they do not injure the coasting trade, and thereby tend to destroy the best nursery for our seamen. In a continental kingdom, perhaps, canals cannot be multiplied too extensively; but in an insular one, the extent to which this practice, wise in the abstract, may be beneficially carried in the detail, is perhaps a problem not more difficult of solution, than necessary to be ascertained. The combination of political, and commercial, importance attached to the subject, is an apology for having dwelt so long on the domestic detail connected with it.

As this act for making the canal from the Trent to the Mersey, and which has been since commonly called the *Grand Trunk*

Canal, has been taken, as we have observed, as a pattern for most subsequent canal acts, the heads abridged cannot be misplaced here.

In the sixth year of the reign of Geo. III. A. D. 1766, "An Act for making a navigable cut or canal from the river Trent, at or near Wilden Ferry, in the county of Derby, to the river Mersey, at or near Runcorn Gap."

The preamble sets forth the advantages which will arise from making the said canal; and the act enacts, that certain persons therein named shall be a body politic and corporate, by the name of The Company of Proprietors of the Navigation from the Trent to the Mersey; and authorises them to cut a navigable canal from Wilden Ferry, in the county of Derby, to or near Aston, Weston, and Eggington, in the county of Derby; Burton, Wichnor, Haywood, Sandon, Stone, Trentham, Stoke, Newcastle, and Harecastle, in the county of Stafford; and Lawton, Sandbach, Middlewich, Preston Brook, and Runcorn, in the county of Chester.

With full power to enter on any land, set off, dig, cut, and make the said canal, with the necessary towing paths, bridges, tunnels, aqueducts, sluices, locks, rivers, reservoirs, &c. and to erect the necessary wharfs, quays, landing-places, cranes, and other works; the said company paying a reasonable compensation for all damages done by them, and the usual powers are given to all bodies politic, &c. and all trustees, guardians, &c. to sell and transfer, and commissioners are appointed to determine all differences.

The proprietors were authorised to raise among themselves the sum of 150,000*l.* divided into 650 shares of 200*l.* each. Every subscriber to have a vote for each share, and no person to possess more than twenty shares, except by will or act in law. (That sum not having been sufficient to complete their works, they were empowered by several subsequent acts of parliament, to raise the further sum of 194,250*l.* on mortgage of the tolls.)

General assemblies are to be held on the last Tuesday in March, and the last Tuesday in September, in every year. Each general assembly to consist of 300 shares, as principals, or proxies. A committee of twenty-one to be chosen by the general assembly, to transact the business of the company, subject to the controul of such general assembly.

Destroying the works of the canal is declared to be felony, and the person guilty to be transported for seven years.

The proprietors are allowed to take for tonnage on coals, stone, timber, and other goods, wares, and merchandise, a sum not exceeding 1½*d.* per ton, per mile, and a further rate of wharfage on all such goods as shall remain on the wharfs above twenty-four hours.

Paving-stones, gravel, sand, and all materials for making and repairing the roads, (lime-stones excepted) dung, soil, marl, and other manure for land, are exempted from any duty, provided the same shall be conveyed when the water flows over the weirs of the locks.

By a clause or clauses in this act, and by agreement with the proprietors of the Trent and Mersey company, the Duke of Bridgewater took a part of their line from Preston-Brook, and was thus enabled to carry his navigable canal into the river Mersey, below Runcorn Gad.

The Trent and Mersey canal was immediately begun, and carried on, under the direction of Mr. Brindly, as long as he lived. It has a fine aqueduct over the river Dove, and a tunnel under the hill of Harecastle for the length of a mile and a half: the whole length of the canal is ninety-one miles, from the Trent at Wildon ferry to the junction with the Duke of Bridgewater's canal at Preston.

After the canal was nearly finished, it was found that the summit, or highest pond of water might sometimes want a supply; to obviate which difficulty, in 1777, application was again made to parliament, for leave to cut another canal from a place called Caldon, to join the Grand Trunk near Newcastle, and also to make rail-ways from a hill of lime-stone, down to the head of that canal. This bill passed, and when this canal was completed, the whole length cut by this company amounted to nearly one hundred and twenty miles, in which there were ninety-one locks; the rise and fall on the Trent side being 316 feet, and on the Mersey side 326 feet. The whole expense of this navigation was upwards of 500,000*l.*, of which the proprietors raised 150,000*l.* among themselves, and the rest on interest.

From this canal others have been carried, with similar advantages, in proportion to their respective extents.

The same year that the first act for cutting the Trent and Mersey passed, another company obtained an act to cut a canal from the river Severn to join the Trent and Mersey canal near Haywood; 70,000*l.* was the capital of the company, with the usual power of borrowing more. The line taken by this canal was from a place called Stourport, in Worcestershire, to pass Mitten, near to Kidderminster, Wolverhampton, Penkridge, and Tixall, to Haywood, where it joins the Trent and Mersey canal. This was a part of Mr. Brindly's plan, and was called the *Staffordshire and Worcestershire Canal*.

Before we proceed to another part of Mr. Brindly's plan, that of approaching London by canals, it may be proper to take a view of some similar undertakings, to which the rising state of Birmingham gave birth.

In the eighth year of the reign of his present majesty, an act passed for making a

navigable cut or canal from Birmingham to join the Staffordshire and Worcestershire canal. This canal, although only between twenty-seven or twenty-eight miles in length, cost a very considerable sum: but both this, and the Staffordshire and Worcestershire canals have amply recompensed the subscribers, and given them the most satisfactory dividends. This arose chiefly from the vast quantity of coals found in the vicinity of the line, and from the great demand for that article at the manufacturing towns in the neighbourhood.

Nearly the same set of proprietors, who had engaged in the Birmingham canal, applied for an act to cut a canal from Birmingham to Fazeley, and then to join the Coventry canal. These two canals were, by a subsequent act of the 21st Geo. 3., united under the title of the Birmingham Canal Navigation.

Another canal, to communicate with these, was planned, and an act passed in the 23d year of the reign of the present king, for making a canal from Wyrly-bank, to communicate with the Birmingham and Fazeley canal near Wolverhampton, to which the title of Wyrly and Effington canal was given, and this was afterwards extended, and they were empowered to join the Coventry canal near Huddersfield.

We have already observed that the plan of Mr. Brindly was to connect all these northern canals with a line of navigation to London, which was to be effected by two different companies; one to take the line from the Trent and Mersey canal at Frudley-heath to Coventry, and the other from Coventry to Oxford.

The act for making the Oxford canal passed nearly about the same time, and was completed about the same period as the Coventry.

The Stourbridge canal act passed in 1776, and was intended to open to that town a communication with the Staffordshire and Worcestershire canal. The same year another act was passed for a canal from the Stourbridge navigation to lands of Lord Foley's, near Dudley, and which is called the Dudley canal, which opened the communication between the towns of Stourport and Dudley, and which, by another act passed in the 25th Geo. 3., was extended to join a canal intended from Birmingham to Worcester.

We now find a communication opened by water, from, and to, the great trading town of Birmingham, to every place on, or near, the Trent and Mersey, and the Staffordshire and Worcestershire canals, and to all the towns in its own neighbourhood, to the westward and northward. The attention of the adventurers was next drawn to the opening a communication eastward and southward.

Accordingly, in the year 1789, an act passed to make a canal from Birmingham to

Warwick, for which 100,000*l.* was raised; another from the Warwick canal, to join the Oxford canal. In 1797, another act passed for making a canal from the Birmingham and Worcester navigations to Stratford-upon-Avon. It remains for us now only to observe, that the original design of connecting the metropolis with every portion of the kingdom by inland navigation, has been recently fulfilled, by the union of the *Grand Junction Canal* before mentioned with that of the *Oxford*, at a place called Braunston, which, proceeding to Uxbridge, and thence to the village of Paddington, now the north-western suburb of London, completes the projected communication with that city. Even this, however, vast and magnificent as the object has always been considered, has been insufficient to satisfy the enterprize of this commercial metropolis; for, while these sheets are passing through the press, a continuation of the Paddington canal, skirting the whole northern side of London, with its adjacent parishes, is progressing toward completion, to join the Thames below the extremity of the eastern environs of the city.

Scotland and Ireland have also largely participated in the spirit of enterprize on this subject. In the former of these kingdoms, beside many inferior ones of infinite local advantage, two instances of inland navigation stand especially pre-eminent, viz. 1st, the great cut, called "The Caledonian Canal," running in a direction nearly east and west, from near Inverness on the east coast, by forts *Augustus* and *William* to the west coast, and making a complete section of the kingdom of Scotland. Secondly, a canal, denominated "The Union," recently undertaken, and connecting Edinburgh, the metropolis, with its rival in wealth and splendour and commerce, Glasgow.

In Ireland, nearly similar facilities are enjoyed by the metropolis, of communicating with the distant part of the kingdom by water-carriage, as we have been describing in England; for by the great canal with its floating dock, which connects Dublin with the Atlantic ocean, on the western side of Ireland, the kingdom is completely intersected, and the capital is enabled to supply almost every county with the commodities which she imports, as well as to convey an interchange of manufactures. See further articles *SCOTLAND*, and *IRELAND*, title *EUROPE*.

NAVIGATOR. A person properly qualified to bear this title, should have a perfect knowledge of the figure and motion of the earth; the various imaginary lines upon it, so as to be able to ascertain the distance and situation of places with respect to one another. He should also be acquainted with the several instruments employed in measuring the ship's way; such as the log, half-minute glass; quadrant, to take the al-

titude of the sun and stars; compass, to represent the sensible horizon; and azimuth compass, to take the azimuth and amplitude of the sun, in order to know the variation of the magnetic needle. He should have an accurate knowledge of maps and charts of the lands and seas; together with the depth of water, the times and setting-in of the tides upon the coasts that he may have occasion to visit; also the currents; of the mould and trim of the ship, and the sail she bears, that so a due allowance may be made for lee-way. By the help of these, he may at all times know the place the ship is in, which way he must steer, and how far he has to run to gain his intended port. The names of the two great divisions of navigation are taken merely from the kind of charts made use of. Plane sailing is that, in which the plane chart is made use of; and Mercator's sailing, or globular sailing, is that, in which Mercator's chart is used. The application of these to practical navigation being parts of the common education of a navigator, it is unnecessary to enlarge further upon them here.

NAVY-BILLS, are bills issued by the navy-board in payment of stores for ships, dock-yards, &c. They are made payable at 90 days, with interest. *See title* **BILLS**.

Counterfeiting navy-bills, &c. punished, 1 Geo. 1. stat. 2. c. 25. s. 6.

Stealing them felony, 2 Geo. 1. c. 25. s. 3.

NEALING. *See* **ANNEALING**.

NEAP, or **NEEP TIDES**, those tides which happen when the moon is in the first and last quarters, being low, when compared to spring tides.

NEAT, or **NET-WEIGHT**, the weight of a commodity alone, clear of the cask, bag, case, and even filth.

NECKLACES, (*GER.* *Halsbänder.* *Du.* *Halsband.* *DA.* *Halsbaand.* *Sw.* *Halsband.* *FR.* *Colliers.* *IT.* *Collane.* *SP.* *Colares.* *PORT.* *Colleiras, Gargantilhas*.) are ornaments worn by females round the neck, composed of diamonds, pearls, gold, &c. and are principally manufactured at London and Birmingham. There is a considerable trade to Africa in necklaces, and similar articles composed of bugles.

NEEDLES, (*GER.* *Nähnadeln.* *Du.* *Naajalden.* *DA.* *Syenaale.* *Sw.* *Synalar.* *FR.* *Aiguilles.* *IT.* *Aghi da cucire, Aguglie.* *SP.* *Agujas para coser.* *PORT.* *Agulhas de coser.* *RUS.* *Igli.* *POL.* *Igly*.) are well-known small instruments, made of steel, pointed at one end, and pierced at the other, used in sewing, embroidery, tapestry, &c. Needles make a very considerable article in commerce, though there is scarcely any commodity cheaper, the consumption of them being almost incredible. The sizes are from No. 1, the largest, to No. 25, the smallest. In the manufacture of needles, German and Hungarian steel are of most repute. In making of them, the first thing is to pass the steel through a coal fire, and then under

a hammer, to bring it out of its square figure into a cylindrical one. This done, it is drawn through a large hole of a wire-drawing-iron, returned into the fire, and drawn through a second hole of the iron, smaller than the first, and thus successively from hole to hole, till it has acquired the degree of fineness required for that species of needles, observing every time it is to be drawn that it is greased over with lard, to render it more manageable. The steel thus reduced to a fine wire, is cut in pieces of the length of the needles intended. These pieces are flatted at one end on the anvil, in order to form the head and eye; they are then put into the fire to soften them farther, and thence taken out and pierced at each extreme of the flat part on the anvil, by force of a puncheon of well-tempered steel; and laid on a leaden block to bring out, with another puncheon, the little piece of steel remaining in the eye. The corners are then filed off the square of the heads, and a little cavity filed on each side of the flat of the head; this done, the point is formed with a file, and the whole filed over; they are then laid to heat red hot on a long, flat, narrow iron, crooked at one end, in a charcoal fire, and when taken out are thrown into a bason of cold water to harden. On this operation a good deal depends; too much heat burns them, and too little leaves them soft; the medium is learned by experience, but might be much sooner known by a thermometer. When they are thus hardened, they are laid in an iron shovel on a fire more or less brisk, in proportion to the thickness of the needles, a scale of which might be easily formed; taking care to remove them from time to time. This serves to temper them, and take off their brittleness; great care here too must be taken of the degree of heat. They are then straightened one after another with the hammer, the coldness of the water used in hardening them having twisted the greater part of them. The next process is the polishing them. To do this, take twelve or fifteen thousand needles, and range them in little heaps against each other in a piece of new buckram, sprinkled with emery-dust. The needles thus disposed, emery-dust is thrown over them, which is again sprinkled with oil of olives: at last the whole is made up into a roll, well bound at both ends. This roll is then laid on a polishing table; and over it a thick plank laden with stones, which two men work backwards, and forwards, a day and a half, or two days, successively; by which means the roll being continually agitated by the weight and motion of the plank over it, the needles within-side being rubbed against each other with oil and emery, are insensibly polished. After polishing, they are taken out, and the filth washed off them with hot water and soap; they are then wiped in hot bran, a little moistened, placed with the needles in a

round box, and suspended in the air by a cord, which is kept stirring till the bran and needles are dry. The needles thus wiped in two or three different brans, are taken out, and put in wooden vessels, to have the good separated from those whose points, or eyes, have been broken, either in polishing or wiping; the points are then turned all the same way, and smoothed with an emery stone turned with a wheel. This operation finishes them, and there remains nothing but to make them into packets of two hundred and fifty each.

NEEDLE-WORK, importing prohibited, 13 and 14 Car. 2. c. 13. May be exported duty free, 11 and 12 Will. 3. c. 3. s. 15.

NEGLECT, every person who engages to do any act, for which he is to receive any compensation or emolument, is responsible for any neglect or mismanagement: thus, if a carrier undertake to carry goods, which are damaged through his neglect, or, if an agent or factor, &c. exceed the authority received from his principal, both are liable to make a compensation in damages, to the extent of the injury sustained.

Neglect is divided, by the laws of England, into *malfeasance*, *misfeasance*, and *nonfeasance*: the first is doing any act wilfully; the second, not doing it as it ought to be done; and the third, omitting to do it at all: the first of these may sometimes amount to a trespass, and the two latter are punishable by an action for damages proportionate to the injury sustained.

NEPHRITIC WOOD, (GER. *Griesholz*. DU. *Graveelhout*. DA. *Griustræe*. SW. *Grüstrü*. FR. *Bois néphrétique*. IT. *Legno nefritico*. SP. *Palonefrítico*. PORT. *Pão nefrítico*. LAT. *Lignum nephriticum*.) a wood of a very dense and compact texture, and of a fine grain, brought to us from New Spain, in small blocks, in its natural state, and covered with its bark. It is to be chosen of a pale colour, sound and firm, and such as has not lost its acrid taste; but the surest test of it is the infusing it in water; for a piece of it infused only half an hour in cold water, gives it a changeable colour, which is blue or yellow, as variously held to the light. If the bottle it is in be held between the eye and the light, the tincture appears yellow; but if the eye is placed between the light and the bottle, it appears blue. This wood is a diuretic, and is said to be of great use with the Indians in all diseases of the kidneys and bladder, in fevers and obstructions of the viscera. The Indians take it in an infusion of cold water.

NEPHRITIC-STONE. See **JADE**.

NET-WEIGHT. See **NEAT**.

NET-PROCEEDS, the amount or sum which goods produce after every necessary deduction is made.

NET-MAKER. This is a branch of business principally dependant on the fish-

ermen, for whose use nets are chiefly made. Net-makers also manufacture nets for fowling, and nets made of silk, &c. for horses. It requires neither much strength, ingenuity, nor capital.

NETTING, in a ship, a sort of grapes made of small ropes, seized together with rope-yarn or twine, and fixed on the quarters, and in the tops; they are sometimes stretched upon the ledges from the waste-trees to the roof-trees, from the top of the fore-castle to the poop; and sometimes are laid in the waste of a ship to serve instead of gratings.

NETTLE. The roots of the common nettle, when boiled, communicate a yellow tinge to yarn. But the most valuable part of this weed is the fibrous stalk or stem, which, on being dressed in a manner similar to flax or hemp, has been in some parts of Europe advantageously manufactured into cloth; and a coarse kind of durable canvas has been made in Great Britain from these materials, which is considerably harder than the cloth manufactured from hemp or flax.

From the rind, as well as the woody substance of the stalk, Dr. Schaeffer produced good white writing paper; although that manufactured by M. de Vilette in France, was of a dark green colour.

The seeds of the nettle, upon expression, afford an useful lamp-oil.

NEVEL, a small coin of a base alloy, current on the coast of Coromandel, eight or nine of which make a fancon, and fifteen fancons a pagoda; the nevel is worth from three to six casses.

NEUTRAL, a designation applied to any ship, that belongs to a nation, state, or port which is in amity with all other powers. Vessels of this description are always to be had in time of war, and are of the utmost utility, in a commercial point of view, as without their interference the current of trade between different parts of the globe, would, in all probability, be entirely impeded. Such nations as can boast the possession of a well ordered marine, in time of war acquire immense profits, by acting as carriers between hostile powers; for the freight which they obtain is necessarily greater than that allowed to vessels in the service of the belligerent states, and must of course increase in proportion to the duration of hostilities. The pristine celebrity of the Dutch navy was produced by that people avoiding war as much as possible, and becoming the general carriers of Europe. In the late war between France and England, the Americans reaped great emolument from their neutrality, and astonishingly improved the state of their marine; many of the northern powers have likewise benefited by our frequent differences with the French. Whatever glory our navy may have acquired by war, the merchant-service

of Great Britain has been vitally injured by its frequency, owing to which, much of her carrying trade has from time to time got into other channels. It is not unusual with many of our trading vessels to *feign neutrality*; or, in other words, to provide themselves with neutral flags, manifests, and other papers, in order to impose upon any enemy which they may fall in with, whilst at sea. Projects of this kind sometimes prove abortive; but they also, not unfrequently, answer the end for which they are formed.

NEUTRALIZATION. When two or more substances destroy each other's properties, they are said to neutralize one another. Thus, in a proper combination of acid and alkaline substances, the acid and alkaline properties are destroyed.

NEWFOUNDLAND, is an island of 350 miles in length from north to south, and 200 in breadth, lying on the eastern coast of North America, between 47° and 52° N. lat. It was discovered by Sebastian Cabot, a Venetian in the service of England, near the conclusion of the 15th century, and has been always highly prized by the nation, not only on account of its fisheries being a mine of wealth, but one of the best nurseries for our navy. It is in itself a barren country; very mountainous, and extremely cold most of the year. There is scarcely any vegetation for the use of man, but it abounds in timber, especially *fir*, which produces as good masts as the *fir* of Norway. Beasts and birds in great variety; of the former, many that are good for food; of the latter, some useful for their skins; but fish is the staple commodity, and makes the value of the island. There are excellent harbours all round the island; St. John's, Trinity, Bonavesta, Conception, &c. &c. There are at least 500 English families continually resident, beside the garisons of St. John's, Placentia, and other forts; and during the fishing season, which is from May to September, both inclusive, at least 10,000 persons resort to it on account of the fishery, which is principally carried on toward the eastern part of the island, where the *great bank* is situate. This bank is a vast mountain under water extending in length according to estimation from 41° N. lat. to 49° 25', and in breadth from 42° 30', to 51° 30' of long. west from London. The depth of water is from 5 to 60 fathoms, covered with fish of all kinds and sizes, from the cod of immense weight, to the smallest sprat, which serves for food to the cod. From one, to five hundred, sail of vessels have been loaded annually from this island for more than two centuries, for the markets of nearly all parts of the world, without any sensible diminution in the quantity of the commodity.

The next bank in size, and prolific in

produce, is called the *green bank*. This bank is by estimation about 120 miles in length, and 50 in breadth, and is in all respects, size excepted, similar in circumstances to the great bank. This is situate on the south coast of the island.

The great strand, or drying place for fish, which is about a league in extent, lies between two steep hills, one of which is separated from the strand by a small rivulet, which forms what is called "the little bay," and abounds with salmon. The great strand will contain sufficient to load 50 or 60 ships at one time. There is a smaller strand, which is principally occupied in preparing fish for home consumption. See *further title FISHERY, article Cod-fishery.*

After what has been premised respecting the productions of the island, it is almost superfluous to add, that almost every necessary of life, both for food (wild fowl and fish excepted) and raiment, are imported from the mother-country.

The government, trade, and relations of Newfoundland, with the mother-country and other states of the world, are regulated by numerous statutes of the British parliament, much too numerous to be even abridged in a mere elementary work of this kind. Suffice it to say, therefore,

1st. That the present territorial provisions for Newfoundland, are by 49 Geo. 3. c. 27.

2dly. That the export of salt from Great Britain, for carrying on the fisheries in Newfoundland, is regulated by 38 Geo. 3. c. 89., and by 57 Geo. 3. c. 49.; by which last-mentioned statute it is allowed to be exported to Newfoundland, and certain other places therein mentioned, duty free.

3dly. That the vessels, by means of which the fisheries on the coasts of Newfoundland are carried on, are governed by 27 Geo. 3. c. 19., 44 Geo. 3. c. 44., and 56 Geo. 3. c. 83. by all of which, certain exceptions from the general laws of navigation are made in favour of Newfoundland.

4thly. That the passengers on board ships sailing to Newfoundland, are regulated by the said 56 Geo. 3. c. 83., as well with respect to numbers, as to accommodations.

5thly. That the trade of Newfoundland (in certain articles specified, being the produce of Europe) with Gibraltar and Malta, which forms an exception to the restrictions imposed on all British colonies by the navigation laws, is regulated by 46 Geo. 3. c. 116.; and further, that additional privileges respecting the direct trade between Newfoundland and the island of Malta, are extended by 55 Geo. 3. c. 20.

6thly. That the trade of Newfoundland with America, and the West India Islands, is under the regulations of 52 Geo. 3. c. 100., extended by 57 Geo. 3. c. 29.; and is further subject to modification by commercial treaties with the government of the American States; the most recent of which was

concluded at London on Oct. 20. 1818, and ratified by the President of the United States on Jan. 30. 1819. By this the respective rights of Great Britain and America, relative to the fisheries on the coasts of Newfoundland and Labrador, are defined.

Commerce, in its outline, not in its minute regulations, being the only province of an elementary work, we must refer the reader for further information relative to the trade of Newfoundland and its appendages of duties, countries, &c., to abridgements of the laws of excise and customs, and other works particularly adapted to the purpose of giving minute practical information; and to the appendix to this work.

NEWSPAPER, an article of too much importance to commerce to be omitted here. A newspaper is a sheet, or half-sheet, of paper, published and renewed periodically; viz. daily, weekly, or at some other determinate period. If it consist of more than a sheet, or a sheet of more than a prescribed size, it becomes a pamphlet; and this distinction is recognized by the statutes which impose the duties on newspapers. These vehicles of intelligence communicate indeed the news of each successive period, which was their only original purpose, with the exception of one, the gazette of government. But the important service which they now perform, in a commercial point of view, is by notifying sales of all kinds, lands, livings, houses, merchandize; by private contract, tender, and public auction; the arrival and departure of vessels; the bankruptcies of traders, the payment of dividends, and the dissolution of partnerships; in short, the wants and wishes of one-half of the nation, and the means of supplying those of the other half.

The 44 Geo. 3. c. 98. imposes a duty of $3\frac{1}{2}d.$ on every newspaper consisting of half a sheet or less *double demy*, or of one sheet *single demy* (sizes of paper so distinguished); and for every half sheet over and above, $3\frac{1}{2}d.$

Printing or exposing to sale, or even having in custody, without stamp, subjects the party offending to 20*l.* penalty, 38 Geo. 3. c. 78.; omitting to print the full price at which sold, to 20*l.* penalty, 49 Geo. 3. c. 50.; letting to hire from house to house, to 5*l.* penalty; inserting seditious matter, &c. copied from foreign papers, to imprisonment, fine, &c., as for a misdemeanor. *Id.*

By 60 Geo. 3. and 1 Geo. 4., certain periodical pamphlets, containing news, &c. published at intervals not exceeding twenty-five days, or published for a less sum than 6*d.*, exclusive of duty, are subjected to the stamp duties on newspapers, and put under the same regulations. And by section 8. of the same act, no persons are to print or publish newspapers, or certain pamphlets, &c. without entering into recognizance or bond for securing fines upon conviction for libels.

NICARAGUA WOOD, (GER. *Nika-*

ragaholz, *Blutholz*. DU. *Bloedhout*. DA. *Blodtræ*. SW. *Blodträ*. FR. *Bois de sang*, *Bois de Nicaragua*. IT. *Legno sanguigno*. SP. *Palo de sangre*. PORT. *Pao sanguinho*.) a kind of dye-wood, of a very bright red colour; brought from Nicaragua, a province of Spanish America, where the tree which produces it grows in great abundance.

NICKEL, a semi-metal, which is rarely found, and then, almost exclusively, in mines of cobalt.

By means of the fixed vegetable alkali, nickel produces yellow, and by the volatile alkali, blue solutions.

The semi-metal fuses with other metals with great difficulty; but it is supposed that the Chinese prepare their white copper by the addition of nickel, which is an elegant composition, and may be applied, in the arts, to many useful purposes.

Nickel is commonly obtained from its sulphuret, the kupfernicksel of the Germans, in which it is generally mixed also with arsenic, iron, and cobalt. This is at first roasted to drive off the sulphur, then mixed with two parts of black flux, put into a crucible, covered with muriat of soda, and heated in a forged furnace. The metal thus obtained is still impure, and must be dissolved in diluted nitric acid, and then evaporated to dryness; and after this process has been repeated three or four times, the residuum must be dissolved in a solution of ammonia, perfectly free from carbonic acid. Being again evaporated to dryness, it is now to be well mixed with two or three parts of black flux, and exposed to a violent heat in a crucible for half an hour or more. Mr. Chenevix observed, that a very small portion of arsenic prevents nickel from being affected by the magnet. When it is not attractable, we may be pretty certain that this is present.

Nickel is employed in potteries, and in the manufacturing of porcelain. A beautiful grass-green colour may be obtained from it; its oxide gives to flint-glass a hyacinthine colour.

NIL, a denomination for a sum of money, used in the late territories of the Grand Mogul. A hundred courons make one padan, and a hundred padans one *nil*. See **COURON**.

NINZIN, a root greatly esteemed in the East, and long since introduced into Europe. Ninzin and ginseng are too generally used as synonymous names, though they are generally very different. Ninzin is an oblong root, larger and thicker than ginseng, and of a more lax and spongy structure; it is usually met with about four or five inches long, and half an inch in diameter, sometimes considerably more. It is of the shape of a small parsnip, largest at top, and tapering to the bottom. It generally runs down all the way single, but sometimes is divided into two or more branches towards

the end. Ninzin is of a pale brown colour, often whitish on the surface, has a yellowish tinge within, an aromatic and sweet smell, an acrid, astringent taste, and is perfectly smooth. It ought to be chosen sound, firm, somewhat tough, not brittle, or dusty, and of an agreeable smell. The true ninzin is collected on the mountains of Corea.

The Chinese and Japanese are extremely fond of ninzin; they, indeed, esteem it inferior to the ginseng, but more than equal to any other drug. They give it as a restorative cordial and provocative, and esteem it the best of all medicines in fevers; and attribute to it all the virtues of ginseng. See GINSENG.

NIPPERS, in a ship, are small ropes about a fathom or two long, with a little truck at one end, and sometimes only a whale-knot. They are used in holding off the cable from the main or jear capstan, where the cable is so slimy, wet, or so great, that they cannot strain it, to hold it off with their hands only.

NITRE. See SALTPETRE; and

NITRIC ACIDS. See ACID, *Nitric*.

NITROGEN-GAS, or AZOTIC GAS, a gaseous fluid which enters into the composition of the atmosphere in the proportion of 78 to 22 of oxygen-gas. It may be obtained by heating phosphorus in a proportion of dry atmospheric air; the phosphorus combines with the oxygen, and leaves the azote free; it however contains a small proportion of carbonic acid gas, from which it may be freed by passing it through lime-water.

Azotic gas is tasteless, inodorous, and insoluble in water. It does not support combustion; and is, when respired, fatal to animals. 100 cubic inches weigh 29.25 grains. With relative increased proportions of oxygen, it forms *nitrous oxide*, *nitrous gas*, *nitrous acid*, and *nitric acid*.

Nitrogen combined with chlorine forms a peculiar gas, composed of 1 part nitrogen, and 4 parts chlorine. The gases will not unite directly, but the compound may be obtained by exposing a solution of nitrate of ammonia to chlorine at a temperature of from 60° to 70°. The gas is absorbed, and an oil-like fluid is produced, swimming on the surface of the solution. This substance is highly explosive, and is decomposed with violent detonation by many combustible bodies.

Nitrogen united with hydrogen constitutes ammoniacal gas.

NOBLE was an ancient English money, now not in use: its value about 6s. 8d.

NONPAREIL, a small sized type, on which small Bibles, and common prayer-books, are printed. Also the name of a celebrated apple.

NONSUIT signifies the termination of a suit sent to a jury for trial, without their

verdict passing upon it. It is sometimes so terminated by direction of the judge, sometimes by the voluntary renunciation of the party, on the discovery of some error in the proceedings. By this mode of withdrawing the matter from the cognizance of the jury, the right of the party to proceed again *de novo*, on the same subject, is preserved.

NOTARY-PUBLIC, is a person duly appointed to attest deeds and writings: he also protests and notes foreign, and inland, bills of exchange and promissory notes; translates languages, and attests the same; enters and extends ships' protests, &c.

The notary's fees of office, for noting and protesting bills, are settled by general acquiescence. The last regulations were by a general meeting of notaries in 1797, the resolutions of which meeting were approved by the Governor and Company of the Bank of England, and form the rule of charging at this time.

NOTES, *promissory*. Promissory notes are merely written promises to pay the sums therein written, either specifically to a particular person, or generally to any person who may be the bearer of them, or sometimes to the order of a particular person, at the time specified; which, in bankers' notes, is usually on demand.

These are made assignable, and indorsable like bills of exchange, by 3 & 4 Anne, c. 9. But prohibited, first, by 15 Geo. 3. c. 51., and subsequently with more precision, and a more summary mode of enforcement, by 48 Geo. 3. c. 88., not to be negotiable under twenty shillings value, but declared null and void, and the issuers punishable before a justice, in a penalty not exceeding 20*l*. nor less than 5*l*.

Bankers' notes, being payable on demand, are considered as cash, whether payable to order, or bearer, and are transferable by delivery, or may be negotiated by indorsement; if made to order are transferable only by the latter mode. *Bayl. Sum.* 31.

On a transfer by mere delivery of a note payable to bearer, the person delivering it ceases to be a party, but on a transfer by indorsement, he is chargeable as new drawer, like a bill of exchange. *Str.* 478.

Upon notes, as well as bills, for less than 5*l*., the indorsement must be attested by a subscribing witness, with the name and abode of the person to whom payable, and bear date at or before making. 17 Geo. 3. c. 30.

The national banks and county bankers alone, issue notes properly so called; the London bankers give cheques. These are only taken conditionally, *if paid*, unless otherwise provided by agreement. And a person who receives such a cheque ought to present it with all reasonable dispatch, that is, immediately, subject only to the directions before pointed out with respect to bills of exchange.

Stamp Duties on Promissory Notes.

Promissory note for the payment of money to the bearer on demand, for any sum not exceeding one pound one					£.	s.	d.
shilling,					0	0	5
Exceeding 1l.	1s.	not exc.	2l.	2s.	0	0	10

These notes are not to be re-issued after having been once paid.

Promissory note, for the payment of any sum of money by instalments, or for the payment of several sums of money at different days or times, so that the whole of the money to be paid shall be definite and certain; the same duty as on a promissory note, payable in less than two months after date, for a sum equal to the whole amount of the money to be paid.

By 31 Geo. 3. c. 25. all unstamped, or improperly stamped, bills or notes shall be void and unavailable: and it shall not be lawful for the commissioners to stamp the same at any time after they shall have been drawn; and the penalty on using paper not stamped, or improperly stamped, is 20l. by the same act of 31 Geo. 3. c. 25.

But by 55 Geo. 3. c. 184. if any person shall sign, accept, or pay any bill, draft, order, or note liable to the duties, without being duly stamped, he shall forfeit 50l. sec. 11.

However, by 37 Geo. 3. c. 136. the holder of any bill, note, draft, or order, stamped with a stamp of a different denomination than required, if of equal or superior value to the stamp required, may, if produced before it be payable, be stamped on payment of the duty and 40s. penalty: but if produced after payable, then on a penalty of 10l. sec. 5, 6.

And by 55 Geo. 3. c. 184. if any person shall issue any bill, draft, order, or note, which shall bear date subsequent to the day on which it shall be issued, so that it shall not in fact become payable in two months if after date, or in sixty days, if after sight, without the proper stamp in such case directed to be used, he shall forfeit 100l. sec. 12.

And if any person shall issue any bill, draft, or order payable to bearer, upon any banker, dated on any subsequent day, or which shall not specify the place where it issued, unless stamped as a bill of exchange, such person shall forfeit 100l. Persons receiving such drafts are also to forfeit 20l. and bankers paying the same shall not only forfeit 100l. but be disallowed the money paid in their accounts against the parties. sec. 13.

Any banker who shall have issued promissory notes for payment to bearer on demand, of any sum not exceeding 100l. may re-issue the same as often as he thinks fit. sec. 14. And that notwithstanding any alteration in the firm, or any alteration therein as to any house or place, where the same were first made payable. sec. 15.

No banker or other person shall, after the 31st of August, 1815, issue any promissory note for payment of money to bearer on demand with the date printed thereon, on pain of 50l. sec. 18.

If any person shall re-issue any note, bill, draft, or order, not allowed to be re-issued: or after payment thereof, shall refuse or neglect to cancel the same, such person shall forfeit 50l. and in case of the same being re-issued, he is also chargeable with a further duty, as if the same had been then first issued, and persons knowingly receiving the same, shall forfeit 20l. sec. 19.

Re-issuable notes are not to be issued by bankers or others without an annual licence of 30l. for each town or place where they are issued. sec. 30.

Promissory notes payable to bearer on

demand, made out of Great Britain, shall not be negotiable, whether payable in Great Britain or not, unless duly stamped; and persons circulating the same are to forfeit 20*l.* for each, but this is not to extend to notes when made and payable only in Ireland. sect. 29.

NOTICE, in law, is the making something known that a man was or might be ignorant of before, and it produces divers effects; for by it the party that gives the same shall have some benefit, which otherwise he should not have had: and by this means the party to whom the notice is given is made subject to some action or charge, that otherwise he would not have been liable to, and his estate in danger of prejudice. *Co. Lit.* 309.

If the holder of a bill of exchange, upon presenting it for acceptance or payment, find it dishonoured, he is bound to give notice to the antecedent indorser; and if he neglect to do so, he cannot recover the amount from them.

NOTING AND PROTEST. In the case of an *inland* bill being refused acceptance, or payment, by the drawer when presented, it should be noted; that is, taken to a notary, who makes a formal demand of acceptance, and if refused makes a *note of it*. If it be a foreign bill, there is the same process, accompanied by what is called a protest, which is only a more formal and particular account of the demand and refusal, drawn out in a more methodical and circumstantial manner. To such an instrument all foreign courts give credit by established usage. They differ in form in different countries, but in England are authenticated additionally by being directed to be on a government-stamp.

The reason why protest and notice are required is, that the parties from whom the holder received the bill, may call on those who are liable to them for an indemnity, therefore it seems immaterial from whom they receive it, so it be actually received.

And the person receiving notice of non-acceptance, noting, or protest, must give like notice to those who are liable to him, or similar reasons.

In an action upon a bill, the plaintiff is entitled to recover the money payable thereby, with interest from the time it became due, to the time of final judgment, with *all* incidental expenses, occasioned by the non-acceptance and non-payment, as noting, protest, &c.; and upon a foreign bill, the drawer. The re-exchange forms a part of the return, and let the bill be returned through ever so many hands, the drawer is liable for the re-exchange upon each return.

Duties on protests are, of any bill of exchange or promissory note, for any sum of money, not amounting to 20*l.* £0 2 0
Amounting to 20*l.* not to 100*l.* 0 3 0
Amounting to 100*l.* not to 500*l.* 0 5 0

Amounting to 500*l.* or upwards £0 10 0
Protest of any other kind - 0 5 0
And for every sheet after the first,
a further duty of - 0 5 0
See further PROTEST.

NUMERO, or NUMBER, in commerce, a term prefixed to any number of things marked N^o.

NUT, or HAZEL-NUT. (GER. *Haselnüsse*. DU. *Haselnooten*. DA. *Haselnødder*. SW. *Hasselnotter*. FR. *Norsettes*, *Avelines*. IT. *Naccinole*, *Avelane*. SP. *Avellanas*. PORT. *Avellãs*. RUS. *Orechki*. POL. *Loskowy orzech*. LAT. *Avellana*.) There are three species of nut-trees, viz. 1. *The corylus avellana*, (from Avellino, in Italy, where they were first cultivated,) or hazel, of which the filbert is a variety. 2. *Corylus rostrata*, or American cuckold-nut. 3. *Corylus columbo*, Constantinopolitan hazel. They are all of the large shrub kind, hardy, and deciduous; and have several varieties valuable for their nuts, as also for their variety in large wildernesses and shrubberies. These nuts are more nourishing than walnuts, but also harder to digest. To come to perfection they require a dry season: much rain will destroy them.

The kernels of the fruit have a mild, farinaceous, oily taste, agreeable to most palates. A kind of chocolate has been prepared from them, and they have sometimes been formed into bread. The oil expressed from them is little inferior to the oil of almonds; and is used by chemists, painters, perfumers, &c. for receiving and retaining odours. Nuts are imported by us from different parts of France, Spain, and Portugal; but principally from Bilboa and Barcelona, in Spain.

In the latter kingdom, the district of Avellino is almost covered with hazel-nut bushes, which in favourable seasons bring in a profit of sixty thousand ducats. These bushes were originally imported into Italy from Pontus, and known among the Romans by the appellation of *nux pontica*. The proprietors plant them in rows, and by dressing, form them into large bushes of many stems. Every year, they refresh the roots with new earth, and prune off the straggling shoots with much attention. The Spanish nuts are usually flatter and longer than the English hazel-nuts: they are imported in bags.

NUTMEG. (GER. *Muskatennüsse*. DU. *Muskäät*. DA. *Muskad*. SW. *Muskot*. FR. *Muscades*, *Noix muscades*. IT. *Noce muscada*. SP. *Moscada*. PORT. *Noz mascada*. RUS. *Muskatnïe oreschki*. POL. *Muscatowa galka*. LAT. *Nux moschata*.) There are two sorts of nutmegs, the one male, and the other female. The female is that in common use; the male is longer and more cylindric, but it has less of the fine aromatic flavour than the other. This is very subject to be worm-eaten, and by the Dutch always strictly pro-

hibited from being packed with the others, lest it give occasion to the insects getting from one species to the other.

The seeds or kernels called nutmegs have been long used both for culinary, and medical, purposes. Distilled with water, they yield a large quantity of essential oil, resembling in flavour the spice itself: after the distillation, an insipid sebaceous matter is found swimming on the water; the decoction inspissated, gives an extract of an unctuous, very slightly bitterish taste, and with little or no astringency. Rectified spirit extracts the whole virtue of nutmegs by infusion, but elevates very little of it in distillation; hence the spirituous extract possesses the flavour of the spice in an eminent degree.

Nutmegs, when heated, yield to the press a considerable quantity of limpid yellow oil, which, on cooling, concretes into a sebaceous consistence. In the shops, there are three sorts of unctuous substances, called oil of mace, though really expressed from the nutmeg.

The best is brought from the East Indies in stone jars: this is of a thick consistence, of the colour of mace, and has an agreeable fragrant smell; the second sort, which is paler-coloured, and much inferior in quality, comes from Holland in solid masses, generally flat, and of a square figure; the third, which is the worst of all, and usually called *common* oil of mace, is an artificial composition of serum, palm oil, and the like, flavoured with a little genuine oil of nutmeg.

The medicinal qualities of nutmeg are aromatic, anodyne, stomachic, and astringent; and with a view to the last-mentioned effects, it has been much used in diarrhœas and dysenteries. The aromatic flavour of nutmeg is very agreeable; it should however not be used in large quantities, as it is apt to affect the head, and even to manifest a narcotic quality in such a degree as to prove extremely dangerous.

The official preparations of nutmeg are, a spirit, and essential oil; and the nutmeg in substance roasted, to render it more astringent. Both the spice itself, and its essential oil, enter several compositions, as the *confectio aromatica*, *spiritus ammoniæ com.* &c. Mace possesses qualities similar to those of the nutmeg, but is less astringent, and its oil is supposed to be more volatile and acrid.

An Account of the Nutmeg-tree.

The nutmeg-tree, in its size and foliage, resembles the pear-tree; it attains the height of thirty feet, producing numerous branches, which rise together in stories. The bark of the trunk is of a reddish-brown, but that of the young branches is of a bright green colour. The leaves are nearly elliptical, pointed, undulated, on the upper side of a bright green, on the under whitish. The

flowers are small, and male and female upon separate trees; they are succeeded by the fruit, which is covered with an external green substance, similar in its form to the common walnut, but more fleshy and full of juice. It is nine months before the fruit comes to perfection. The nutmeg differs in goodness according to the age of the tree, the soil, the exposition, and mode of culture. The round nutmeg is preferred to that which is oblong; and that fruit is more particularly esteemed which is fresh, moist, heavy, of good smell, and an agreeable though bitter flavour, and which yields an oily juice when pricked. Nutmeg-trees grow in several islands of the Eastern Ocean. The wood-pigeon of the Moluccas is unintentionally a great planter of these trees, and disseminates them in places, whence the monopolizers of the article which they produce conceive it their interest that they should be rooted out, or otherwise destroyed. The growth of this aromatic is chiefly confined to a few of the Banda Islands, whereof Banda itself, Neira, and Puloay produce 800,000 lb. of nutmegs annually.

The method of gathering and preparing nutmegs.—When the fruit is ripe, the natives ascend the trees, and gather it by pulling the branches to them with long hooks. Some are employed in opening them immediately, and in taking off the green shell or first rind, which is laid together in a heap in the woods, where in time it putrefies. As soon as the putrefaction has taken place, there spring up great quantities of mushrooms underneath, called *boleti moschatyni*, of a blackish colour, and much valued by the natives, who consider them as delicate eating. When the nuts are stripped of their first rind, they are carried home, and the mace is carefully taken off with a small knife. The mace, which is of a beautiful red, but afterwards assumes a darkish-red colour, is laid to dry in the sun for the space of a day, and is then removed to a place less exposed to his rays, where it remains for eight days that it may soften a little. They afterwards moisten it with seawater, to prevent it from drying too much, or from losing its oil. They are careful, however, not to employ too much water, lest it should become putrid, and be devoured by the worms. It is at last put into small bags, and closely squeezed.

The nuts, which are still covered with their ligneous shell, are for three days exposed to the sun, and afterwards dried before a fire, till they emit a sound, when they are shaken; they then beat them with small sticks in order to remove their shells, which fly off in pieces. These nuts are distributed into three parcels, the first of which contains the largest and most beautiful, which are intended for Europe; the second contains such as are reserved for the use of the inhabitants; and the third contains the smallest, which are irregular or unripe.

These are burnt; and part of the rest is employed for procuring oil by pressure. A pound of them usually produces three ounces of oil, which has the consistence of tallow, and entirely the taste of nutmeg.

The nutmegs which have been thus selected, would soon corrupt if they were not watered, or rather pickled, with lime-water made from calcined shell-fish, which is diluted with salt water till it attains the consistence of fluid pap. Into this mixture the nutmegs, contained in small baskets, are plunged two or three times, till they are completely crusted over with the mixture. They are afterwards laid in a heap, where they heat, and lose their superfluous moisture by evaporation. When they have sweated sufficiently, they are then properly prepared, and fit for exportation.

NUX-VOMICA, (for the synonyms, see **POISON-NUT**.) a flat, compressed, round kernel of a fruit, somewhat downy, and of a very firm texture; it has no smell,

but is of a very bitter taste. We have it only from the East Indies, together with another drug, the *lignum colubrinum*, the tree on which the *nux-vomica* grows. This tree, which is extremely large, is principally met with in Malabar and Coromandel. The species are three: the *nux-vomica*, *colubrine*, and *potatorum*: The surface of the *nux-vomica* is not much corrugated, its texture is firm, like horn, of a pale greyish colour without, and various colours within, sometimes white, and sometimes brown: the largest, whitest, newest, and cleanest being the best. It is generally about the breadth of a shilling. It is extremely bitter and deleterious, though used in medicine. *Nux-vomica* has been more than suspected to have been made use of in the porter breweries, although it is so strongly narcotic as to poison dogs, fishes, &c. When it is suspected that a dog has swallowed this drug, the administering of two or three spoonfuls of vinegar will perfectly counteract its deleterious effects.

OAK

O, The fourteenth letter of the alphabet. As a numeral it is used for eleven, and with a dash over it, thus, *Ö*, signifies 11,000.

OAK, (GER. *Eiche*. DU. *Eik*. DA. *Eeg*. SW. *Ek*. FR. *Chêne*. IT. *Quercia*. SP. *Roble*. PORT. *Roble*, *Carbalho*. RUS. *Dub*. POL. *Dab*. LAT. *Quercus*.)

The English oak claims precedence as a timber-tree, for its prodigious height and bulk, and the superior worth of its timber. Every possessor of considerable estates ought therefore to be particularly assiduous in raising woods of them; which is effected by sowing the acorns either in a nursery and the plants transplanted where they are to remain, or sown at once in the places where they are always to stand. There are said to be nearly 30 different species of the oak genus.

All the sorts will grow in any middling soil and open situation, though in loam they are generally most prosperous; they will thrive tolerably in gravelly, sandy, and clayey land, as may be observed in many parts of this country of the common oak; but it has been found by experiment that the timber of oaks grown in clay soil is the toughest and most durable; that such as is grown in sharp sand easily shivers, and is least durable.

Besides the grand purposes to which the timber is applied in navigation and architecture, and the bark in tanning of leather, there are other uses of less consequence, to

OAR

which the different parts of this tree have been referred. The highlanders use the bark to dye their yarn of a brown colour, or, mixed with copperas, to procure a black. Oak saw-dust is also a principal ingredient in dyeing drabs, especially fustian. The acorns are a good food to fatten swine and turkeys. There are acorns produced from another species of oak, which are eaten to this day in Spain and Greece, with as much pleasure as we eat chesnuts.

OAK-APPLES, sometimes called oak-balls, a kind of galls, or excrescences, arising out of oak. See **GALLS**.

OAK-BARK, (GER. *Bork*, *Eichenrinde*, *Loke*. DU. *Run*, *Runne*. DA. *Bark*, *Garverbark*. SW. *Bark*, *Ekbark*. FR. *Tawbrut*. IT. *Scorza di quercia*. SP. *Corteza de encina*. PORT. *Casca do carvalho*. RUS. *Dubowii kora*. POL. *Dab garbarshi*.) See **tiles BARK** and **TANNING**; and respecting the importation of oak bark, see 12 Geo. 2. c. 50. and 52 Geo. 3. c. 18.

OAKUM, old ropes untwisted, and pulled out into loose hemp, in order to be used in caulking the seams, tree-nails, and bends of a ship, for stopping and preventing leaks, &c.

OARS. (GER. *Riemen* (zu fahrzeugen). DU. *Riemen*. DA. *Aarer*. SW. *Aror*. FR. *Avirons*, *Rames*. IT. *Remi*. SP. and PORT. *Remos*.) Oar, in navigation, a long piece of wood, for moving a vessel by rowing. Oars for ships are generally cut out of fir-timber, those for barges are made out

of New England or Dantzic rafters, and those for boats out of English ash, or Norway fir-rafters.

OATH, an affirmation or denial, of any thing before one or more persons, who have the authority to administer the same, for the discovery and advancement of truth and right. See **AFFIDAVIT**.

OATS. (GER. *Hafer*. DU. *Haver*. DA. *Havre*. SW. *Hafre*. FR. *Avoine*. IT. *Vena*, *Avena*. SP. *Avena*. PORT. *Avea*. RUS. *Owes*. POL. *Owies*. LAT. *Avena*.) We reckon twenty-five species of this grain, some of which are said to be indigenous. The large, white, Poland oat is most esteemed, being the only one entirely proper for the making of meal for medicinal, and culinary, purposes; and at the same time the best for horse-provender. Oats will thrive on almost any soil, but are an early, or a late, crop, according to the land on which they are sown. In the counties consisting of a warm sand, the white oats of different kinds are usually sown, and are an early crop. In the cold, and the wet, counties, a small, coloured oat is generally sown late, and produces the last crop of corn of the season. See **CORN**.

OBLIGATION, is a bond containing a penalty, with a condition annexed, either for payment of money, performance of covenants, or the like; this security is termed a specialty, and is preferred, in a course of administration, to a debt upon simple contract. 2 *Black. Com.* 340.

All persons who are capable of contracting, may bind themselves by an obligation. If a married woman enter into an obligation, such obligation shall be void, and neither she nor her husband shall be bound by it.

The obligation of an infant, although for necessities, will be also void.

Two or more persons may bind themselves jointly, and severally, in which latter case the obligee may sue jointly, or severally; but if they are jointly, and not severally, bound, the obligee must sue them jointly; and in such case, if one of them dies, his executor is totally discharged, and the survivor and survivors only will remain chargeable.

If two jointly, and severally, bind themselves in an obligation which they severally deliver at different times; the obligation is either joint, or several, at the election of the obligee.

If an obligation be made to three, to pay money to one of them, they must all join in suit, for they constitute but one obligee; and if he, to whom the money is paid, dies, the survivors must sue, although they have no interest in the sum contained in the condition.

In an obligation to three, where two bring their action, they ought to shew that the third is dead. See **BOND**.

OBOLUS, in pharmacy, a weight, two

of which make a scruple, and three scruples one drachm.

OBSERVATION, among navigators, implies the taking the sun or stars' meridian altitude, in order thereby to find the latitude of the place required.

OCCUPIERS of walling, a term in the salt-works for the persons who are the sworn officers that allot, in particular places, what quantity of salt is to be made, that the markets may not be overstocked, and see that all is carried fairly and equally between the lord and the tenant.

OCHAVO, or **OCTAVO**, a small copper coin of Spain, equivalent to $\frac{2\frac{3}{8}}{1\frac{3}{8}}$ of a penny sterling.

OCHRE, (GER. *Ocher*, *Oker*. DU. *Oker*. DA. *Ocksr*, *Ocher*. SW. *Ockra*, *Ochra*. FR. *Ochre*, *Ocre*. IT. *Ocra*, *Ocria*. SP. *Ocre*. PORT. *Ocra*, *Ochre*. RUS. *Wochra*. POL. and LAT. *Ochra*.) a genus of earths, slightly coherent, and composed of fine, smooth, soft, argillaceous particles, rough to the touch, and readily diffusible in water. It is a combination of alumina and red oxide of iron. Ochres are of various colours, as red, blue, yellow, brown, green, &c. They are to be found in greater abundance in England, and Italy, than in any other parts of the world. Ochres are of extensive use as colours, not only in oil but in water-painting.

The colours of every species of ochre may be varied by means of fire, and thus brown, and yellow, ochres are frequently turned to red pigments.

OCTAVO, signifies a sheet of paper folded into eight leaves.

OFFICE, is that function, by virtue whereof a person has some employment in the affairs of another. An office is a right to exercise any public or private employment, and to take fees and emoluments thereunto belonging, whether public, as those of magistrates, or private, as of bailiffs, receivers, &c. The statute of 5 and 6 Edw. 6. c. 16. declares all securities given for the sale of offices unlawful. And if any person shall bargain or sell, or take any reward, or promise of reward, for any office, or the deputation of any office, concerning the revenue, or the keepers of the king's castles, or the administration and execution of justice, unless it is such an office as has been usually granted by the justices of the king's bench or common pleas, or by justices of assize, every such person shall not only forfeit his right to such office, or to the nomination thereof, but the person giving such reward, &c. shall be disabled to hold such office. But it has been decided, that where an office is within the statute, and the salary certain, if the principal makes a deputy, reserving by bond a less sum out of the salary, it is good; or if the profits are uncertain, reserving a part as half the profits, it is good; for the fees still belong to the principal, in

whose name they must be sued for. But where a person so appointed, gives a bond to the principal to pay him a certain sum, without reference to the profits; this is void under the statute. *Salk.* 465.

And now by stat. 49 Geo. 3. c. 126. it is declared to be a misdemeanor to *buy, sell, pay money for, offer a reward for, or enter into negotiation relative to*, the purchase or sale of all offices in the gift of the crown, or of any officer appointed by the crown; of all commissioners civil, naval, or military; and to all places, &c. under the controul or superintendence of the commissioners of the treasury, secretaries of state, commissioners of the admiralty, principal officers of the ordnance, commander in chief, secretary at war, paymaster of the forces, commissioners for the affairs of India, for those of the excise, navy, victualling, or transport boards, commissary-general, storekeeper-general, and the principal officers of all other public departments, &c. &c.

These provisions are still further extended with respect to offices in Ireland, by 53 Geo. 3. c. 54. And now, by the annual mutiny act, it is provided that any person not being an authorized army agent, negotiating for the purchase, sale, or exchange of commissions in his majesty's forces, shall forfeit for such offence 100*l.* and treble the value of the sum received or negotiated for, above the price allowed by his majesty's regulations.

And by the above-mentioned statute of 49 Geo. 3., publishing or advertising the names of brokers or agents for negotiating bargains of those kinds, or of houses for the transacting of such negotiations, is made an offence punishable by fine of 50*l.* on conviction, payable to the prosecutors.

To offer money to any officer of state, to procure the reversion of an office in the gift of the crown, is a misdemeanor at common law, and punishable by information; and even the attempt to induce him under the influence of a bribe, is criminal, though never carried into execution. Any contract to procure the nomination to an office, not within the statute, is defective in the ground of public policy, and the money agreed to be given is not recoverable.

OFFICERS of the *Customs, Excise, and Stamp Duties, &c.* See CUSTOM OFFICERS, EXCISE, STAMPS, &c. and OFFICE.

OFFING, or OFFIN, in the sea language, that part of the sea a good distance from shore, where there is deep water, and no need of a pilot to conduct the ship; thus, if a ship from shore is seen sailing out to seaward, they say, she stands for the offing; and if a ship, having the shore near her, has another a good way without her, or towards the sea, they say that ship is in the offing.

OIL. (GER. *Oel*. DU. *Ol*, *Olje*, *Oly*. DA. *Olje*. SW. *Olja*. FR. *Huile*. IT. *Olio*.

SP. *Aciee*. PORT. *Oleo*. RUS. *Masto*. POL. *Oley*. LAT. *Oleum*.) There are two classes of oils exceedingly different from each other, namely, fixed oils, and volatile oils. The latter are also susceptible of a division into fat, and drying, oils.

Fixed oils are distinguished by the following character: 1. Liquids, or easily becoming so when exposed to a gentle heat. 2. An unctuous feel. 3. Very combustible. 4. A mild taste. 5. Boiling point not under 600°. 6. Insoluble in water and alcohol. 7. Leave a greasy stain upon paper. Those oils which are called also fat, or expressed oils, are numerous; and are obtained, partly from animals and partly from vegetables, by simple expression. As instances may be mentioned whale or train oil, obtained from the blubber of the whale; olive-oil, obtained from the fruit of the olive; linseed-oil and almond oil, obtained from linseed and almond-kernels. Fixed oils may also be extracted from poppy-seeds, hemp-seeds, beech-mast, birch-tree, and many other vegetable substances.

Certain dry matters may be made to afford oil by expression, by grinding them into a meal, which being suspended so as to receive the vapour of boiling water, will thus be moistened, and afford an oil, in the same manner as almonds. Oils obtained by expression should be suffered to dehydrate themselves, by standing in a moderately cool place; to separate from their water, and deposit their faces: from both which they ought to be carefully freed.

The only part of vegetables in which fixed oils are found is the seeds of bicotyledinous plants. In animals they are most usually deposited in the liver, though they are found also in the eggs of fowls.

Fixed oil is usually a liquid with a certain degree of viscosity, adhering to the sides of the glass vessels in which it is contained, and forming streaks. It is never perfectly transparent, having always a certain degree of colour; most usually it is yellowish or greenish. Its taste is sweet, or nearly insipid. When fresh it has little or no smell. Its specific gravity varies from 0.9403 (the specific gravity of linseed-oil) to 0.9155 (the specific gravity of olive-oil).

When fixed oils are exposed to the open air or to oxygen gas, they undergo different changes according to the nature of the oil.

1. Some of them dry altogether, without losing their transparency, when thin layers of them are exposed to the atmosphere. These are distinguished by the name of drying-oils, and are employed by painters. Linseed-oil, nut-oil, poppy-oil, and hempseed-oil, possess this property; but linseed-oil is almost the only one of these liquids employed in this country as drying oil. The cause of this peculiarity has not been completely investigated; but it is well known that these oils possess the drying

quality at first but imperfectly. Before they can be employed by painters, they must be boiled with a little litharge. During this operation the litharge is partly reduced to the metallic state. Hence it has been conjectured that drying oils owe their peculiar properties to the action of oxygen: which is supposed either to constitute one of their component parts, or to convert them into drying oils by diminishing their hydrogen.

2. Other fixed oils, when exposed to the atmosphere, gradually become thick, opaque, and white, and assume an appearance very much resembling wax or tallow. These have been distinguished by the term fat oils. Olive-oil, oil of sweet almonds, of rape-seed, and of ben, belong to this class.

3. Both these classes of oils, when exposed in considerable quantity to the action of the atmosphere, undergo another change, well known under the name of rancidity. But the fat oils become rancid much more readily than the drying oils. Rancid oils are thick, have usually a brown colour, convert blues to red, and have the smell and taste of sebatic acid. During the change which they undergo, some drops of water also appear on their surface. The rancidity of oils then is owing to the formation of a quantity of acid in them. This, together with the water, is evidently the consequence of a partial decomposition.

Fixed oils combine with alkalies and earths, and form with them compounds called soaps. The fat oils enter into these combinations, much more readily than the drying oils. See SOAP.

Volatile oils, called also essential oils, are distinguished by the following properties:

1. Liquid; often almost as liquid as water; sometimes viscid.
2. Very combustible.
3. An acrid taste, and a strong fragrant odour.
4. Boiling point not higher than 212 degrees.
5. Soluble in alcohol; and imperfectly in water.
6. Evaporate without leaving any stain on paper.

By this last act it is easy to discover whether they have been adulterated with any of the fixed oils. Let a drop of the volatile oil fall upon a sheet of writing-paper, and then apply a gentle heat to it. If it evaporates without leaving any stain upon the paper, the oil is pure, but if it leaves a stain, it has been contaminated with some fixed oil or other.

If an essential oil be adulterated with an expressed oil, there is another mode of discovering the fraud, by adding a little spirit of wine to a few drops of the suspected oil, and shaking them together; for the spirit will dissolve all the oil that is essential, and leave the expressed oil untouched. If an essential oil be adulterated with alcohol, to

discover the fraud put a few drops of the oil into fair water; if it be adulterated the water will immediately turn milky, and by continuing to shake the glass, the whole quantity of spirit will be absorbed by the water, and leave the oil pure at the top. If an essential oil be adulterated by a cheaper essential oil, such as oil of turpentine, this fraud will easily be discovered by the real flavour being overpowered by the turpentine smell.

Volatile oils are almost all obtained from vegetables, and they exist in every part of the plants; the root, the bark, the wood, the leaves, the flower, and even the fruit: though they are never found in the substances of the cotyledons; whereas the fixed oils, on the contrary, are almost always contained in these bodies. When the volatile oils are contained in great abundance in plants, they are sometimes obtained by simple expression. This is the case with the oil of oranges, of lemons, and of bergamot; but in general they can only be obtained by distillation. The part of the plant containing the oil is put into a still with a quantity of water, which is distilled off by the application of a moderate heat. The oil comes over along with the water, and swims upon its surface in the receiver. By this process are obtained the oils of peppermint, thyme, lavender, and a great many others, which are prepared and employed by the perfumer. Others are procured by the distillation of resinous bodies. This is the case in particular with oil of turpentine, which is obtained by distilling a kind of resinous juice, called turpentine, that exudes from juniper.

The scented flowers, like jessamine, honeysuckle, sweet-briar, roses, &c. usually require to be treated in a particular manner; the essential oil being too dear, and scarcely obtainable by distillation, if the flowers are barely infused in fine oil of nuts, or oil of ben, drawn without heat, and kept in a cool place, their subtile, odoriferous matter will pass into the oil, and richly impregnate it with their flavour. These essences may be rendered still more perfect by straining off the oil first put on, and letting it stand again without heat, upon fresh flowers; which operation may be repeated twice or thrice. Oil impregnated with green herbs, as camomile, alder, &c. requires long boiling to obtain their virtues.

The greater number of volatile oils are liquid, and some of them are as transparent and colourless as water. This is the case with the oil of turpentine; but for the most part they are coloured. Some of them are yellow, as the oil of lavender; some brown, as the oil of rhodium; some blue, as the oil of camomile; but the greater number of volatile oils are yellow, or reddish-brown.

Their odours are so various as to defy all description. It is sufficient to say, that all the fragrance of the vegetable kingdom re-

sides in the volatile oils. Their taste is always acrid, hot, and unpleasant. Their specific gravity is for the most part less than that of water; but some volatile oils, as those of canella and sassafras are heavier than water. The specific gravity of oils varies from 0.8697 to 1.6439. Water dissolves a small portion of volatile oils, and acquires the odour and taste of the oil which it holds in solution.

When heated, they evaporate very readily and without alteration. They are much more combustible than fixed oils, owing to their greater volatility. They burn with a fine, bright, white, flame, exhale a great deal of smoke, deposit much soot, and consume a greater proportion of the oxygen of the atmosphere than fixed oils. The products of their combustion are water and carbonic acid gas. From these facts it has been concluded that they are composed of the same ingredients as the fixed oils, but that they contain a greater proportion of hydrogen.

When exposed to the action of cold they congeal like the fixed oils; but the temperature necessary to produce this effect, varies according to the oil. Some of them, as oil of anise, and of fennel, become solid at the temperature of 50 degrees; frozen oil of bergamot and of canella become liquid at 25°; oil of turpentine at 14°. Margueron exposed several volatile oils to a cold of 17°. They congealed, or rather crystallized partially, and at the same time emitted an elastic fluid. These crystals consisted partly of the oils themselves, partly of other substances. Some of them had the properties of benzoic acid.

Volatile oils, when exposed to the action of light in close vessels, and excluded from common air, undergo very singular changes. Their colour becomes deeper, they acquire a great deal of consistency, and their specific gravity is considerably increased. Tingry, to whom we are indebted for these

interesting researches, has proved that light is a necessary agent. It was supposed formerly that they were occasioned by the absorption of oxygen; and when oxygen is present, it has been ascertained that it is absorbed; but Tingry has proved that the same changes go on when oxygen is excluded. This philosopher ascribes them to the fixation of light. And if this be the real cause, the quantity of light fixed must be enormous; for as the specific gravity of the oils is increased considerably while the bulk continues the same, it is evident that the absolute weight must be increased proportionably. One circumstance, however, renders this conclusion doubtful, at least in its full extent; and that is, that the quantity of change was always proportional to the quantity of the oil and the quantity of air contained in the vessel.

When exposed to the open air, their colour becomes gradually deeper, and they acquire consistency, while they exhale, at the same time, a very strong odour. The air around, as Priestley first ascertained, is deprived of its oxygen, a quantity of water is formed, and the oils at last, for the most part, assume the form of resins.

Volatile oils are applied to a great number of uses. Some of them are employed in medicine; some of them, as oil of turpentine, are much used to dissolve resins, which are afterwards employed as varnishes; not to mention their employment in painting, and perfumery. Besides the oils which exist ready formed in the vegetable and animal kingdoms, there are a variety of others which are obtained when animal or vegetable bodies are distilled by means of a heat above that of boiling water. These oils have received the appellation of empyreumatic, because they are formed by the action of fire.

The following is a list of the plants which yield the fixed oils occurring usually in commerce.

1	Linum usitatissimum & perenne	-	-	Linseed oil
2	Corylus avellana	}	-	Nut oil
3	Juglans regia			
4	Papaver somniferum	-	-	Poppy oil
5	Cannabis sativa	-	-	Hemp oil
6	Sessamum orientale	-	-	Oil of sesamum
7	Olea Europea	-	-	Olive oil
8	Amygdalus communis	-	-	Almond oil
9	Guilandina Mohringa	-	-	Oil of behen
10	Cucurbita pepo & melapepo	-	-	Cucumber oil
11	Fagus sylvatica	-	-	Beech oil
12	Sinapis nigra & arvensis	-	-	Oil of mustard
13	Helianthus annuus & perennis	-	-	Oil of sunflower
14	Brassica napus & campestris	-	-	Rapeseed oil
15	Ricinis communis	-	-	Castor oil
16	Nicotiana tabacum & rustica	-	-	Tobacco-seed oil
17	Prunus domestica	-	-	Plum kernel oil
18	Vitis vinifera	-	-	Grapeseed oil
19	Thebroma cacao	-	-	Butter of cacao
20	Laurus nobilis	-	-	Laurel oil
21	Arachis hypogæa	-	-	Ground-nut oil

OIL

The following TABLE contains a copious list of plants which yield volatile oils. The part from which it is extracted, and the English name of the oil, are in separate columns.

Plants.	Parts.	Oil of	Colour.
1 <i>Artemisia absinthium</i>	Leaves	Wormwood	Green
2 <i>Acorus calamus</i> - -	Root	Sweet flag	Yellow
3 <i>Myrtus pimenta</i> - -	Fruit	Jamaica pepper	Yellow
4 <i>Anethum graveolens</i> -	Seeds	Dill	Yellow
5 <i>Angelica archangelica</i>	Root	Angelica	
6 <i>Pimpinella anisum</i> -	Seeds	Anise	White
7 <i>Illicium anisatum</i> -	Seeds	Stellat. anise	Brown
8 <i>Artemisia vulgaris</i> -	Leaves	Mugwort	
9 <i>Citrus aurantium</i> - -	Rind of the fruit	Bergamot	Yellow
10 <i>Meloleuca leucodendra</i>	Leaves	Cajeput	Green
11 <i>Eugenia caryophyllata</i>	Capsules	Cloves	Yellow
12 <i>Carum carui</i> - -	Seeds	Cardaways	Yellow
13 <i>Amomum cardamomum</i>	Seeds	Cardamum seeds	Yellow
14 <i>Carlina acaulis</i> - -	Roots		White
15 <i>Scandix chaerefolium</i> -	Leaves	Chervil	Sulph. yellow
16 <i>Matricaria chamomilla</i>	Petals	Chamomile	Blue
17 <i>Laurus cinnamomum</i> -	Bark	Cinnamon	Yellow
18 <i>Citrus medica</i> - -	Rind of the fruit	Lemons	Yellow
19 <i>Cochlearia officinalis</i>	Leaves	Scurvy grass	Yellow
20 <i>Copaifera officinalis</i> -	Extract	Copaiba	White
21 <i>Coriandrum sativum</i> -	Seeds	Coriander seed	White
22 <i>Crocus sativus</i> - -	Pistils	Saffron	Yellow
23 <i>Piper cubeba</i> - -	Seeds	Cubebs-pepper	Yellow
24 <i>Laurus culilaban</i> - -	Bark	Culilaban	Brown yellow
25 <i>Cuminum cyminum</i> -	Seeds	Cummi	Yellow
26 <i>Innula helenium</i> - -	Roots	Elecampane	White
27 <i>Anethum fœniculum</i> -	Seeds	Fennel	White
28 <i>Croton eleutheria</i> -	Bark	Cascarilla	Yellow
29 <i>Maranta galanga</i> - -	Roots	Galanga	Yellow
30 <i>Hypopus officinalis</i> -	Leaves	Hyssop	Yellow
31 <i>Juniperus communis</i> -	Seeds	Juniper	Green
32 <i>Lavendula spica</i> - -	Flowers	Lavender	Yellow
33 <i>Lauris nobilis</i> - -	Berries	Laurel	Brownish
34 <i>Prunus laurocerasus</i> -	Leaves	Laurocerasus	
35 <i>Levisticum logisticum</i>	Roots	Loveage	Yellow
36 <i>Myristica moschata</i> -	Seeds	Mace	Yellow
37 <i>Origanum majorana</i> -	Leaves	Marjoram	Yellow
38 <i>Pistacia lentiscus</i> - -	Resin	Mastich	Yellow
39 <i>Matricaria parthenium</i>	Plant	Motherwort	Blue
40 <i>Melissa officinalis</i> -	Leaves	Balm	White
41 <i>Mentha crispa</i> - -	Leaves		White
42 ——— piperitis - -	Leaves	Peppermint	Yellow
43 <i>Achillea millefolium</i> -	Flowers	Millefoil	Blue and green
44 <i>Citrus aurantium</i> - -	Leaves	Neroli	Orange
45 <i>Origanum creticum</i> -	Flowers	Spanish hop	Brown
46 <i>Apium petroselinum</i> -	Roots	Parsley	Yellow
47 <i>Pinus sylvestris & abies</i>	Wood and resin	Turpentine	Colourless
48 <i>Piper nigrum</i> - -	Seeds	Pepper	Yellow
49 <i>Rosmarinus officinalis</i> -	Plant	Rosemary	Colourless
50 <i>Mentha pulegium</i> -	Flowers	Pennyroyal	Yellow
51 <i>Genista canariensis</i> -	Root	Rhodium	Yellow
52 <i>Rosa centifolia</i> - -	Petals	Roses	Colourless
53 <i>Ruta graveolens</i> - -	Leaves	Rue	Yellow
54 <i>Juniperus sabina</i> - -	Leaves	Savine	Yellow
55 <i>Salvia officinalis</i> -	Leaves	Sage	Green
56 <i>Santalum album</i> - -	Wood	Santalum	Yellow
57 <i>Laurus sassafras</i> - -	Root	Sassafras	Yellow
58 <i>Satureia hortensis</i> -	Leaves	Satureia	Yellow
59 <i>Thymus serpyllum</i>	Leav. and flow.	Thyme	Yellow
60 <i>Valeriana officinalis</i>	Root	Valerian	Green
61 <i>Kæmpferia rotunda</i> -	Root	Zedoary	Greenish blue
62 <i>Anomum zinziber</i> -	Root	Ginger	Yellow
63 <i>Andropogon schænanthum</i>		Sira	Brown

Several of the gum-resins, as myrrh and galbanum, yield an essential oil: and likewise the balsams, as benzoin, &c.

OIL. Search to be made in London for defective oils. 3 Hen. 8. c. 14.

OIL OF BEECH. Several unsuccessful attempts have been made to manufacture this oil with profit from English beech. The following appears the best process: the kernel is obtained by passing the nuts through a mill, the stones of which are set sufficiently wide to break the outer shell without materially bruising the fruit; the broken shells are afterwards separated by a common winnowing machine. The kernels are then thrown into scalding water, and such as float are supposed to be so mouldy as to give a bad taste to the produce. The rest are reduced to a pulp, and then cold drawn, when they will be found to yield 15 per cent. of a clear light-coloured oil, nearly insipid, equally as good as common olive-oil. The marc being now slightly roasted, and again pressed, will yield 12 per cent. more of an inferior oil; and the dry residue is a much better food for cattle than common oil-cake.

OIL OF TURPENTINE. Upon making turpentine, the sap which collects in a hole at the bottom of the tree is put into a basket. The part which runs through, constitutes the turpentine, and the thicker matter which remains in the basket, they put into a common alembic, adding a large quantity of water. They distil this as long as any oil is seen swimming upon the water. This oil, separated from the surface, is the common limpid, essential oil, called spirit of turpentine. The remaining matter at the bottom of the still is common yellow rosin.

OIL OF VITRIOL, is the common name given in trade to sulphuric acid. See *ACID, Sulphuric*.

OIL-CAKE. The cake which remains, after having expressed the oil from flax, rape, and some other seeds. It is used for the fattening of cattle, of all kinds, in winter, and has been determined now, by considerable experience, to be excellent for the purpose. It is given generally in the cake broken into pieces, sometimes mixed with bran, or chaff; but it may be diffused in hot water, and given in a liquid state. Some cattle will take it best in one way, others in the other.

OIL-NUTS. See *CASTOR-NUTS*.

OILMAN. The oilman sells hams, oils, pickles, salt, anchovies, &c.

OILY-GRAIN. (*GER. Sesam. Du. Aostersche vygboonen. DA. and Sw. Sesam. FR. Sesame, Jugeoline, Gergelin, Gingeoline. IT. Sesamo, Sisamo, Giuggiolena. SP. Ajonjole, Alegria. PORT. Gergelim, Jergelim, Cingilim. RUS. Kunschut. POL. Sesam. LAT. Sesamum,*) the produce of a plant of which there are three species. This plant is called the sesamum. The oriental sesamum grows

naturally in India, and is an annual plant. After its flowers are past, the germen turns to an oval acute-pointed capsule, with four cells, filled with oval compressed seeds, which ripen in autumn. This sort is chiefly to be met with on the coast of Malabar, and in the island of Ceylon. The sesamum indicum, another species, grows in many parts of India. The first sort is frequently cultivated in Africa, and in the eastern countries, as a pulse; and of late years the seeds have been introduced into Carolina by the African negroes, where they succeed very well. The inhabitants of that country make an oil from the seed, which will keep good for many years, without having any rancid smell, or taste. It is used as a salad-oil, and for all the purposes of sweet-oil. Nine pounds of this seed, brought from Carolina, yielded upwards of two quarts of oil; as great a quantity as has been obtained from any vegetable whatever.

OLERON, Sea Laws of, certain laws relating to maritime affairs, made in the time of Richard I. when he was at the island of Oleron. These laws, being accounted the most excellent sea-laws in the world, are recorded in the black book of the admiralty.

OLIBANUM. See *GUM*.

OLIVE, (*Olives. GER. and Du. Oliven. DA. and Sw. Oliver. FR. Olives. IT. Ulive, Olive. SP. Aceitunas. PORT. Azeitonas. RUS. Oliwki. POL. Oliwki. LAT. Olivæ,*) a fruit which yields a large quantity of oil, the produce of the *olea*, olive-tree.

There are seven species of this tree, of which the most remarkable are: 1. The Europea, or common olive-tree. It rises with upright solid stems, branching numerously on every side, 20 or 30 feet high; spear-shaped, stiff, opposite leaves, two or three inches long, and half an inch or more broad; and at the axillas small clusters of white flowers, succeeded by oval fruit. This species is the principal sort cultivated for its fruit; the varieties of which are numerous, varying in size, colour, and quality. It is a native of the southern parts of Europe, and is cultivated in great quantities in the south of France, Italy, and Portugal, for the fruit to make the olive-oil. 2. The *carpensis*, or cape box-leaved olive. 3. *Olea odoratissima*, the flower of which is by some said to give the fine flavour to the green-tea; but which is attributed by others to different causes. See *TEA*.

Olives, or the fruit of the olive tree, have an acrid, bitter, and extremely disagreeable taste; pickled (as we receive them from abroad) they prove less disagreeable. The Lucca olives, which are smaller than the others, have the weakest taste; the Spanish, or larger, the strongest; the Provence, which are of a middling size, are generally the most esteemed.

When olives are intended for preservation, they are gathered before they are ripe.

The art of preparing them consists in removing their bitterness, in preserving them green, and impregnating them with a brine of aromatised sea-salt, which gives them an agreeable taste. For this purpose different methods are employed: formerly they used a mixture of a pound of quicklime, with six pounds of newly-sifted wood-ashes; but of late, instead of the ashes, they employ nothing but a ley. This, it is alleged, softens the olives, makes them more agreeable to the taste, and less hurtful to the constitution.

In some parts of Provence, after the olives have lain some time in the brine, they remove them, take out the kernel, and put a caper in its place. These olives they preserve in excellent oil; and when thus prepared, they strongly stimulate the appetite in winter. Olives perfectly ripe are soft, and of a dark red colour. They are then eaten without any preparation, excepting only a seasoning of pepper, salt, and oil; for they are extremely tart, bitter, and corrosive.

The wood of the olive-tree is beautifully veined, and has an agreeable smell. It is in great esteem with cabinet-makers, on account of the fine polish of which it is susceptible.

Trials have been frequently made, but without success, to multiply the olive by growing the seeds; it has always been found necessary either to employ cuttings, or to procure wild plants from the woods. An inhabitant of Marseilles, astonished to find that we cannot obtain by cultivation what nature produces spontaneously, was led to inquire in what manner the wild plants were produced. He found that they proceed from the kernels which have been carried into the woods, and sown there by birds, who have swallowed the olives. By the act of digestion, these olives have been deprived of their natural oil, and the kernels have become permeable to the moisture of the earth; the dung of the birds has served for manure, and, perhaps, the soda which this dung contains, by combining with a portion of the oil which has escaped digestion, may also favour germination. From these considerations, the following experiments were made. A number of turkeys were caused to swallow ripe olives; the dung was collected, containing the kernels of these olives, the whole was placed under a stratum of earth, and was frequently watered. The kernels were found to vegetate, and a number of young plants were procured. In order to produce upon olives an effect similar to that which they experienced from the digestive powers of the stomach, a quantity of them was macerated in an alkaline lixivium: they were then sown, and olive plants were produced from them, as in the former experiment.

This may be considered as a very important discovery, and may be applied to

other seeds besides the olive, which are, in the same manner, so oily, that, except under some rare circumstances, the water cannot penetrate them, and cause their development: of this description is the nutmeg.

Sir Joseph Banks observed, that the growth of the hawthorn-seed, which is usually two years before it shoots above the earth, may be hastened a whole season by being swallowed by cattle.

OLIVE-OIL. (GER. *Baumöl.* DU. *Boomöl.* DA. *Bomölje.* SW. *Bomolja.* FR. *Huile d'olives.* IT. *Olio d'uliva.* SP. *Aceite de aceitunas.* PORT. *Oleo das azeitonas.* RUS. *Derevännoe masslo.* POL. *Oleiva.* LAT. *Oleum olivarum.*) The oil is undoubtedly that part of the produce of the olive trees which is of greatest value. The quality of it depends on the nature of the soil where the trees grow, on the kind of olive from which it is expressed, on the care which is taken in the gathering and pressing of the fruit, and likewise on the separation of the part to be extracted. Unripe olives give an intolerable bitterness to the oil, when they are over-ripe, the oil has an unguinous taste: it is therefore of importance to choose the true point of maturity. When the situation is favourable, those species of olives are cultivated which yield fine oils; otherwise they cultivate such species of trees as bear a great quantity of fruit, and they extract oil from them for the use of soaperies, and for lamps. They gather the olives about the months of November or December. It is best to put them as soon as possible into baskets, or into bags made of wool or hair, and to press them immediately, in order to extract a fine oil. Those who make oil only for soaperies, let them remain in heaps for some time in their storehouses; when afterwards pressed, they yield a much greater quantity of oil.

Even those who extract oil to be used in food, sometimes allow the olives to ferment in heaps, that they may have more oil; but this is extremely hurtful to the quality, and the reason why fine oil is so very rare. In order to have the oil in its purity, it must be allowed to deposit its sediment, and then it must be poured off into another vessel. That which is extracted from the pulp only of olives, is the most perfect which can be obtained, and will keep for several years; but that obtained from the kernel or the nut, or from the whole olive ground in the common way, in public mills, has always more, or fewer, defects, loses its limpidity in a certain time, and is very apt to become rancid. After all, in the course of time, olive-oil loses its qualities, becomes disagreeable to the taste, and smell, diminishes in fluidity, and at last thickens considerably. The refuse of the first pressing, when squeezed a second time, yields an oil, but thicker, and less pure, than the first. What remains after the second pressing, when

mixed with a little water, and placed in a pan over the fire, produces by pressure a third oil, but of a very inferior quality.

The process of expressing oil from olives, as used in France, is thus described by Chaptal. The olive is crushed by a mill-stone placed vertically, rolling upon a horizontal plane. The paste thus formed is strongly squeezed in a press; and the first oil which comes out is called virgin-oil. The pulp is then moistened with boiling water; the mass is again pressed; and the oil which floats upon the water, carries with it part of the parenchyma of the fruit, and a great part of the mucilage, from which it is with difficulty separated.

Oil of olives is an ingredient in the composition of a great many balsams, ointments, plasters, and mollifying and relaxing liniments.

Olive-oil is of no use in painting, because it never dries completely. The best soap is made of it, mixed with Alicant salt-wort and quicklime.

The consumption of olive-oil is incredible: the southern parts of France, and also Italy, Candia, and Sicily, yield the greatest quantities. The provinces in the kingdom of Naples, most abundant in oils, are Bari, Otranto, Calabria, and Abruzzo. The produce upon ten years' average has been estimated at six hundred thousand salme; about six and a half salme, making a tun of 252 gallons. The exportation of oil brings into Calabria Ultra half a million of ducats annually. Gallipoli, a sea-port town in the province of Otranto, is the place in the kingdom of Naples from which the greatest quantity of olive-oil, and the best quality for the use of the British woollen manufactories is exported. The trade is entirely in the hands of the merchants at Naples and Leghorn, especially the former, who have their agents at Gallipoli, and by making advances to the poor cultivator, keep him constantly in their chains, so much so, that it would be difficult to purchase a cargo of Gallipoli oil, at Gallipoli; and it always can be procured more reasonably at Naples. The Neapolitan contractors either purchase at a fixed price, or at the *prezzo della voce*, that is to say, the average price of the sales made in the months of November, and December. The orders for the delivery of oil at Gallipoli are treated like bills of exchange, and have sometimes five or six indorsements. On buying oil, the seller will perhaps not deliver any of it out of his own cellars, but give orders upon others, and they upon others again, so that the buyers may have to receive it from a dozen different people. Oil, therefore, at Gallipoli, never can be bought according to sample, but if not of a good merchantable quality, it may be refused. There is much jobbing carried on in this trade; frequently the Gallipoli agents sell, on their own account, the oil purchased

for their principals, and when the orders for delivery come upon them unexpectedly, they must replace it any price. A plentiful crop of olives, in the neighbourhood of Gallipoli, yields from forty to fifty thousand salme of oil.

Sicilian oil is inferior to the Calabrian, and the latter to the Gallipoli; so that Gallipoli is always worth about two pounds sterling per tun more than the best Calabrian; and from three to five pounds more than the best Sicilian oil. The reason is, that the Calabrian and Gallipoli oils have less foot, and more colour and substance than those of Sicily. This superior quality of the Gallipoli oil may, in some measure, proceed from the nature of the soil; but it arises more particularly from a better management in manufacturing and refining it. At Gallipoli they deposit their oil, to settle and purify, in large stone cisterns fixed under ground, and the quality of the stone used for that purpose is said to be particularly adapted for retaining the heat, and promoting thereby the fermentation necessary for its refinement. In Calabria, and Sicily, it is kept in earthen jars.

At Gallipoli, if the oil on delivery does not prove *lampante e bacille*, that is, bright and clear, the buyer has a right to refuse it.

In Sicily, to prevent disputes, the contract ought to be so made, that if, when the tops of the jars shall be taken off with a ladle, the oil shall appear in the least disturbed, the buyer may object to taking the remainder.

The district of the Dietro Marino produces the best oil in Calabria, in goodness very little inferior to that of Gallipoli. Milazzo is the place which in Sicily produces the greatest quantity of oil; then comes Sciacca, then Cefalu, Tasa, Mistretta, Pettineo, and St. Stefano. The oils coming from Milazo and Sciacca are chiefly consumed in the soap manufactures; those from Pettineo and Mistretta are the best for eating; but their consumption is limited to Italy, as they have, like all oils produced in Naples and Sicily, a rank taste and smell.

This country is entirely supplied with eating oil from Leghorn, and Genoa, known under the denomination of Lucca and Florence salad-oil. An account of the discovery of a substitute for olive-oil will be found under the head of ITALY, article EUROPE. The parts of France which afford the greatest plenty of olive-oil are Provence and Languedoc. The French oils, especially that called *Aix*, are excellent, and their colour is generally a bright grass green. These oils are usually exported through Marseilles, and the other ports of France, situate on the Mediterranean. The olive-oil brought from the island of Candia is nearly similar to the Sicilian oils, and is fit only to be employed in the manufacture of soap.

Oil abroad, should never be brought out of the casks, as it is difficult to judge of the

quality, and scarcely possible to draw it off without disturbing some of the foot. To prevent leakage, it is best not to ship oil in cargoes from Italy, unless in autumn or winter.

This article is sold at London by the tun of 236 gallons, but it pays freight and duty at the rate of 252 gallons to the tun.

The best oil should be clear, of strong body, free from foot or sediment, of a perfectly sweet taste and smell, and a bright gold colour.

OLIVETS, in the commerce of the coast of Africa, a name given to mock-pearls, or a species of bugle, in the form somewhat similar to the fruit of the olive tree. They are usually white, and are much prized by the negroes of Senegal.

OMNIUM, a term used among the stock-jobbers to express all the articles included in the contract between government and the original subscribers to a loan, which of late years has generally consisted of different proportions of three, and four, per cent. stock, with a certain quantity of terminable annuities. Those who dispose of their share soon after the agreement is concluded, generally get a premium of two, or three, per cent. for it, which fluctuates with the current prices of the public funds; and in some instances the omnium has been at a considerable discount. Some of the subscribers pay their whole subscription at the time fixed for the first, or second, payment, and their shares become immediately transferable stock: others dispose of the several articles which make up the terms of the loan, separately; and in this state the three, or four, per cent. consols, &c. are distinguished by the name of scrip, till the whole sum has been paid in upon them.

ONION. (GER. *Zwiebel*, *Zippel*. DU. *Uyen*, *Ajain*. DA. *Rödlög*. SW. *Rödlök*. FR. *Oignon*. IT. *Cipolla*. SP. *Cebolla*. PORT. *Cebola*. RUS. *Luk*. POL. *Cebula*. LAT. *Cepa*.) The most reputed sorts of onion are the Strassburgh, the Spanish, the Portuguese, and the Egyptian. It is not known whence this plant was first brought to Europe, but the Spanish, and Portuguese, onions are most famous in this country, and vast quantities of them are imported in baskets. Besides its culinary uses, the onion has been employed medicinally, especially the squill, or sea-onion.

ONUS IMPORTANDI. The charge of importing, mentioned 12 Car. 2. art. 28.

ONUS PROBANDI. The burthen of proving, spoken of 14 Car. 2. c. 11, and in several other statutes.

ONYX, (GER. and SW. *Onyx*. FR. *Onix*, *Onice*. SP. *Onique*. PORT. *Onix*. POL. *Onich*, *Oniks*. LAT. *Onyx*.) one of the semipellucid gems, with variously coloured zones, but none red; being composed of crystal, debased by a small admixture of earth, and made up either of a number of

flat plates, or of a series of coats surrounding a central nucleus, and separated from each other by veins of a different colour, resembling zones or belts. There are four species of this gem: 1. A blueish-white one, with broad white zones. 2. A very pure onyx, with snow-white veins. 3. The jasp-onyx, or horny onyx, with green zones. 4. The brown onyx, with blueish-white zones.

The ancients attributed wonderful properties to the onyx, and imagined that if worn on the finger it acted as a cardiac; they have also recommended it as an astrigent; but these, like other superstitions, have passed away. It is found on the shores of rivers in the East Indies, New Spain, and other parts of America, as also in Germany; but the latter are greatly inferior to the American kind; the Oriental are the most beautiful of all.

OPAL. (GER. and SW. *Opal*. FR. *Opale*. IT. *Opalo*. SP. *Opalo*, *Piedra iris*. PORT. *Opala*. LAT. *Opalus*.) This stone is found in the East Indies, in Egypt, Arabia, Cyprus, Persia, and Tartary, and in some parts of Europe, especially in Hungary, in the Crapacks near the village of Czennizka. When first dug out of the earth it is soft, but it hardens and diminishes in bulk by exposure to the air. The substance in which it is found is a ferruginous sandstone. The opal is always amorphous. Its fracture is conchoidal. Commonly somewhat transparent. Specific gravity from 1.958 to 2.540. The lowness of its specific gravity, in some cases, is to be ascribed to accidental cavities which the stone contains. These are sometimes filled with drops of water. Some specimens of opal have the property of emitting various-coloured rays, with a particular effulgence, when placed between the eye and the light. The opals which possess this property are distinguished by lapidaries by the epithet oriental; and often by mineralogists by the epithet *nobilis*. This property rendered the stone much esteemed by the ancients.

An opal described in Frederick Hasselquist's Travels in the Levant, was of the size of a hazel-nut, in the form of a half globe. If held horizontally, it had a very fine olive colour; but if held perpendicularly, between the eye and the light, it had the colour of the finest ruby. The opal, and almost every other stone accounted precious by the ancients, is to be found in the ruins of Alexandria, and Old Cairo.

OPHITES, a kind of variegated marble, of a dusky green ground, sprinkled with spots of a dark green colour. It is found in many parts of the world, of three colours, green, white, and grey. The last-mentioned is found in England, especially in Derbyshire; the green in Arabia, and the white in some few places on the continent of Europe. It obtains its name

from a Greek word signifying a *serpent*, from the variegated spots upon it resembling that reptile.

OPIUM, (GER. *Opium*, *Trockner mohn-saft*, *Oder schlafsaf*. FR. *Opium*. IT. *Opio*. SP. and PORT. *Opio*. LAT. *Opium*.) is obtained from the *papaver album*, or white poppy, a plant which is cultivated in great abundance in India and other parts of the East. The poppies are planted in a fertile soil, and well watered. After the flowering is over, and the seed-capsules have attained nearly their full size, a longitudinal incision is made in them about sun-set for three or four evenings in succession. From these incisions there flows a milky juice which soon concretes, and is scraped off the plant, and wrought into cakes. In this state it is brought to Europe. Opium thus prepared is a tough, brown substance; has a peculiar smell, and a nauseous, bitter, acrid taste. It becomes softer when held in the warm hand, and burns very readily and strongly.

The *meconium*, or common opium, is prepared in the East Indies by pressing the poppy-heads, that have been already cut. The juice that comes out of them, mixed with the least beautiful of the other drops, is kneaded with water, and made into cakes, which are sent to Europe. The finer East India opium not being brought to Europe, may account for the superior quality of the Turkish opium. A very considerable trade is carried on in this article at Patna, on the river Ganges. Neumann was informed by some Turks at Genoa and Leghorn, that in certain places the heads, stalks, and leaves, of the poppy are committed to the press together, and that the juice thus extracted, affords, when inspissated, a very good opium. It is certain, that the extract made by boiling the heads, or the heads and stalks, in water, is much weaker than opium; but it appears also, that the pure milky tears are considerably stronger. Opium has been made from poppies in England, equal to that imported from abroad; and Dr. Coxe, of Philadelphia, asserts, that the inspissated milky-juice of the common garden lettuce is precisely similar in its effects to the opium of Turkey.

An excessive fondness for opium prevails in all parts of Turkey, and the East Indies. In vain have the laws of China condemned to the flames every vessel that imports, and every house that receives it; the consumption is not less considerable. It is still greater at Malacca, Borneo, the Moluccas, Java, Macassar, Sumatra, &c. These islanders smoke it with their tobacco; those who are desirous of attempting some desperate action intoxicate themselves with the fume. The Turks, likewise, smoke and chew opium just before they go into battle. Opium at present is in great esteem. Its effects, on those who are accustomed to take it in considerable quantities, are highly

exhilarating; it produces a kind of pleasing delirium, in which the imagination is vividly employed in contemplating the most delightful images, and forming the most extravagant combinations of ideas: but the depression which ensues, when its effects have subsided, is proportionably great: the ill consequences which arise from this are more serious than those from the immoderate use of wine; the most dreadful nervous irritation, and debility, is experienced, and the strength of the body, and powers of the mind are soon destroyed.

As a medicine, taken occasionally, and in proper quantities, it is, perhaps, the most valuable we possess. It is not only the most efficacious for the relief of pain consequent on disease, but also the most effectual remedy for many diseases themselves.

OPOBALSAMUM, (GER. DU. DA. and Sw. *Opobalsamum*. FR. *Opobalsamum*, *Baume de Gilead*. IT. SP. and PORT. *Opobalsamo*. LAT. *Opobalsamum*.) balsam, or balm of Gilead; called also *Balsamum Judaicum*, *Syriacum*, *Mecca*, and golden balsam. A medicine brought into some celebrity of late. It is admitted, however, even by the Turks, that on account of the great price of this article, it is very difficult to find it genuine; it is generally adulterated immediately on its filtration from the tree which yields it, and scarcely to be found pure any where, except in the possession of the Turkish emperor and the grandes of the empire, who get it as a valuable present from travellers. The marks of its supposed purity are, a very yellow colour, perfectly transparent; a strong fragrant smell, with something of the lemon or citron flavour; and a bitter, sharp, and astringent taste. It is also very tenacious and glutinous, sticking to the fingers, and capable of being drawn into long threads. The mode of trying opobalsamum at Cairo, and Mecca, is as follows; they let fall a drop of the balsam into a cup of clear cold water; if this drop remains in one place on the surface of the water, the balsam is of little value; but if it instantly expands like a pellicle over the whole surface, and this skim is even and clear, then it is a sign that the balsam is genuine. Opobalsamum principally comes from Arabia Petrea, and the Arabians carry it to Mecca, where they sell it during the stay of the Egyptian and Turkish caravans. It is also produced in Palestine, but there great care must be taken to prevent the tree from degenerating, which is not necessary in Arabia, where it grows spontaneously. This balsam, the produce of a species of *amyris*, which rises to the height of the pomegranate tree, to which it has a great resemblance, both in its long branches and flowers. The wood is red, and gummy, and its fruit is a small nut covered with a dry, and brown, pellicle,

which contains a kernel. In the months of June, July, and August, the opobalsamum distils from it, by incision, in the form of a viscous juice. The juice extracted from the fruit is called *carpobalsamum*, and that from the wood, *Xilobalsamum*. The smell, and consistence, of opobalsamum are similar to the turpentine of Cyprus, whence the former is frequently adulterated with the latter. There is a sort of balsam of Mecca, which is a whitish, dry gum, resembling copperas, especially when old; it has all the virtues of the balm of Gilead, and hence it is conjectured to be the same, only hardened, and altered in colour. Balsam of Gilead, or opobalsamum, is used in medicine to remove obstructions of the lungs, as a stomachic, and also externally for curing wounds, &c. The Turkish women employ it as a cosmetic.

OPOCALPASON, the juice of a tree called Celpasi. It resembles myrrh. A deadly poison taken internally, but of use in some external applications.

OPODELDOC, a solution of soap in alcohol, with the addition of camphor, and volatile oils. It is used externally against rheumatic pains, sprains, bruises, and other like complaints.

OPOPONAX, (GER. Du. Da. and Sw. *Opoponax*. FR. *Opopanax*. IR. *Opoponasso*. SP. and PORT. *Opoponaca*. LAT. *Opoponax*.) a resin obtained from the *pastinaco opoponax*, a plant which is a native of the countries round the Levant. The milky juice, when dried in the sun, constitutes the opoponax. It is in lumps of a reddish-yellow colour, and white within, of a bitter and acrid taste.

Opoponax is usually brought to us in granules or drops, and sometimes in large masses, formed by a number of the drops connected by a quantity of substance of the same kind; but these are usually loaded with extraneous matter; and are greatly inferior to the loose kind.

OPTICS, in its comprehensive sense, signifies the science of vision; whence telescopes, microscopes, spectacles, and other glasses, to assist vision, are denominated *optical glasses*, and those who deal in them, *opticians*. The best practical opticians in the world are those of the British metropolis; and a considerable commerce is carried on by them with all parts of the globe, in the numerous articles of their formation.

ORANGES. (GER. *Pomeranzen*. Du. *Oranjen*. Da. *Pomerantser*. Sw. *Pomeranser*. FR. *Oranges*. IR. *Mélarance*. SP. *Naranjas*. PORT. *Laranjas*. RUS. *Pomeranzeii*. POL. *Pomerancy*. LAT. *Aurantia mala*.) This fruit is the produce of the *Citrus aurantium*, of which the varieties are, 1. Seville orange: this is a very handsome tree, and the hardest of any; as in this country it shoots freely, produces large and beautiful leaves, flowers, &c. The fruit of

this variety is large, rough-rinded, and sour, of excellent quality for economical uses. 2. The China orange: this tree has moderately sized leaves, and a smooth, thin rind, sweet fruit; of this there are several varieties in warm countries, where they grow in the open ground.

The orange-tree in general has an upright smooth trunk, divided upwards into a branchy regular head, from five to ten and twelve feet high; oval, spear-shaped, entire leaves, having winged footstalks, and numerous white flowers at the sides of the branches, succeeded by globular fruit compressed at each end. The flowers appear principally in May or June. The fruit continue setting in July, and ripen the year following. Great quantities of Seville oranges are consumed in Great Britain and Ireland, which are chiefly brought from Spain and Portugal. The Spanish oranges are decidedly superior to the Portuguese, containing much more juice than the latter, and their rinds being by no means so thick and spongy. Reggio is said to be the spot where the culture of oranges was first attempted in Italy, and whence it was extended over that country. The island of Malta, situated in the Mediterranean, furnishes abundance of oranges, which in size, flavour, and quantity of substance, are not to be exceeded by those of any other part of the world; they are, however, said not to keep so well as the Spanish, and Portuguese, oranges, a circumstance which may be attributed to their uncommon lusciousness. It is said that the finest-flavoured fruit is obtained by engrafting the China orange on a Seville orange stock. Oranges come to great perfection in the West India Islands, and it is strange their culture is not more attended to in Jamaica, and other of our colonies. Oranges of very excellent quality are grown in Provence, Languedoc, and other parts of the south of France, whence they are sent, packed in fir chests, to different European states. The oranges of the Bermudas are of an extraordinary size, and a peculiarly excellent flavour; they are mostly brought to England. Sweet oranges grow in abundance in the southern provinces of China; but the inhabitants set very little value upon them: there is, however, a species of orange of which the Chinese make a dry conserve, of a flattish form, which they export to many parts of the world, and even send vast quantities of it to Mexico. The oranges which are to be commonly met with in the province of Fo-kyan are much larger than any of those of Europe, and their flavour nearly approaches to that of the muscadine grape. Oranges are frequently prepared in the form of conserves, and perfectly dry, especially in Sicily, whence they are sent to many parts of Europe, but in greatest quantities to Leghorn, Venice, and Rome. Upwards of 150 quintals of dried oranges are an-

nally exported from Sicily. The juice of the fruit contains an essential acid salt, mixed with much mucilage. This salt may be obtained in crystals by diluting the juice, clarifying it with whites of eggs, and evaporating. The juice not freed from its mucilage is apt to become mouldy; but by the above-mentioned method of depuration, a saline extract may be made, capable of being preserved, which is possessed of the same medicinal qualities as the juice, which is said to be very powerful in the scurvy. The rind of the orange contains a considerable warmth, and abounds in an essential oil, which may be procured by pressing the peel against an inclined glass. In Provence and Italy the peel is rasped; by which means the vesicles are torn, and the oil flows into the vessel destined to receive it. This oil suffers the parenchyma which goes along with it to subside, and becomes clear by standing. If a lump of sugar be rubbed against these vesicles, it imbibes the volatile oil, and forms an oleosaccharum, soluble in water, and very proper to give an aromatic flavour to certain liquids. The flowers of the orange tree have been for some time in great esteem as a perfume. They are highly odoriferous, and of a somewhat warm, and bitter, taste. They yield their flavour by infusion to rectified spirit, and in distillation both to spirit, and water. An oil distilled from the flowers is brought from Italy under the name of *oleum, or essentia neroli*.

ORANGES, *China, or Portugal Oranges*. (GER. *Apfelsinen*. DU. *Sina appelen*. DA. *Abelsin*. SW. *Appelsiner*. FR. *Pommes de Chine, Oranges douce de Portugal*. IT. *Portogalli, Aranci dolci della China*. SP. *Naranjas Chinas*. PORT. *Laranças doces da China*. RUS. *Apelzinü*. POL. *Pomaranca szodka*. LAT. *Aurantia Sinensia*.) See **ORANGES**.

ORANGE-BUDS, are small dried oranges, which, from want of nourishment, blights, or other causes, fall from the trees before coming to perfection, as is the case with other fruit. They are mostly imported from Italy, and are used by distillers and others, to give a flavour to spirits and various kinds of liquids.

ORCANET. See **ALKANET**.

ORCHILLA-WEED, ORCHELLA, or ARCHELLA. (GER. *Orseille*. DU. *Orseille, Orsel, Orchillie*. DA. *Orselje, Farnemos*. SW. *Orsilja*. FR. *Orseille*. IT. *Oricello, Orcella, Rocella, Raspa, Rospo, Respio*. SP. *Orchilla*. PORT. *Orsella, Orzella*. RUS. *Arset*. POL. *Mech farbierski*. LAT. *Rocella*.) The lichen *rocella*, or *orchella weed*, is a whitish moss, yielding a rich purple tincture, used for dyeing. It is found in abundance in several of the islands of the Archipelago, and also in some of those near the African coast, particularly in the Canary and Cape de Verd islands. It grows partly in single, partly in double stems, to the height of

about two inches, of a light, or sometimes dark-grey colour. As early as the time of Pliny, it would appear that this plant was in use, for giving the ground in dyeing purple; and the *phycos thelasion*, or *ponion*, of which he speaks, is probably our orchilla. Be this as it may, the art of dyeing with orchilla was discovered in the Levant, about the year 1500, by a Florentine merchant of the family of Oricellarii, or Rucellai, who, happening one day to make water on a plant of which there was a great abundance, observed that it became extraordinarily red, and having made several experiments on the herb, and finding it proper to die wool purple, he sent some of it to Florence, where it became of great utility in the cloth manufactures. Certain it is, from a variety of documents, that the art of dyeing in *oricello* was known at Florence at the commencement of the 14th century, whence it spread over the rest of Europe. The Italians alone, for some time, furnished all Europe with orchilla, from the Levant; but upon the re-discovery of the Canary isles, towards the end of the 14th or beginning of the 15th century, it was principally imported from the latter. The growth of orchilla in the Canary islands is more beautiful, and abundant, than in the Levant: and that of the Cape de Verd islands again, appear larger, richer, and longer than the produce of the Canaries. This may be owing to its not being collected every year. Orchilla is generally found incrusting rocks, stones, and (otherwise) arid mountains. Auvergne, in France, and several parts of Holland, produce very excellent orchilla-weed. This moss is brought to us as it is gathered, but to prepare it for the purpose of dyeing, it is ground betwixt stones, moistened occasionally with spirit of wine, and so made up in a paste, called by the French, *orseille en pate*. Many, instead of keeping the paste in a moist state with wine, as they ought, suffer it to dry. It then has the appearance of a dark violet-coloured earth, intermixed with some white spots. The Dutch are the inventors of a dye called *Lacmus*, or *orseille en pierre*, which seems to be an adulterated kind of orchilla paste. There is also a kind of moss different from the orchilla, and known by the name of *orseille de terre, orseille d'Auvergne*, which is used for a like purpose, but it contains fewer and lighter colouring particles. The orchilla-paste is rarely used as a dye by itself, on account of its dearness, and the speedy evanescence of its beauty. It is chiefly employed to give a bloom to other colouring matters, as pinks, &c. Linnæus, in the "Swedish Transactions," for the year 1748, asserts, that the true archill moss is to be found on the western coasts of England. This dye has been, for a considerable time past, prepared in Scotland, from a species of the moss found in the Highlands. Prepared orchilla very readily gives out its colour to

water, to volatile spirits, and to alcohol; it is the substance principally made use of for colouring the spirits of thermometers. A solution of orchilla in water, applied on cold marble, stains it of a beautiful violet or purplish blue colour, far more durable than the colour it communicates to other bodies. There is a considerable consumption of a species of archil called *cudbear*, which is manufactured in Scotland, and sells in London at about 19d. or 20d. per lb. See titles DYEING and CUDBEAR.

ORDNANCE, a general name for all sorts of great guns used in war. See CANNON.

ORDNANCE, *Office of*, an office kept within the Tower of London, which superintends and disposes of all the arms, instruments, and utensils of war, both by sea and land, in all the magazines, garrisons and forts in Great Britain.

ORDNANCE-DEBENTURES, bills issued by the board of ordnance for the payment of stores, &c. purchased for that department.

ORGAN, a wind instrument, blown by bellows, and containing numerous pipes of various kinds and dimensions, and multifarious tones and powers. Of all musical instruments, this is the most proper for the sacred purpose to which it is most generally applied in all countries wherever it has been introduced. Its structure is lofty, elegant, and majestic; and its solemnity, grandeur, and rich volume of tone, have justly obtained it an acknowledged pre-eminence over every other instrument, for sacred music.

An organ, when complete, is of threefold construction, and furnished with three sets of keys; one for what is called the great organ, and which is the middle set; a second (or lower set) for the choir organ; and a third (or upper set) for the swell. In the great organ, the principal stops are the two diapasons, the principal, the twelfth, the fifteenth, the sesquialtra, the mixture or furniture, the trumpet, the clarion, and the cornet. The choir organ usually contains the stops diapason, the dulciana, the principal, the flute, the twelfth, the bassoon, and the vox-humana. The swell comprises the two diapasons, the principal, the hautboy, trumpet, and cornet. Besides the complete organ, there are other organs of lesser sizes, and more limited powers, adapted to chapels and private houses. There is also the barrel or hand-organ, consisting of a moveable turning cylinder called a barrel, on which, by means of wires, pins, and staples, are set the tunes it is intended to perform. These pins and staples, by the revolution of the barrel, act upon the keys within, and give admission to the wind from the bellows to the pipes. The barrel-organ is generally portable; and so contrived that the same action of the hand which turns the

barrel supplies the wind by giving motion to the bellows.

The church-organ properly consists of two parts; the main body, called the great organ, and the positive or little organ, which forms a small case or buffet, placed before the great organ. The size of an organ is generally expressed by the length of its largest pipe: thus, they say, an organ of eight, sixteen, thirty-two feet, &c. The organ in the cathedral church at Ulm in Germany is ninety-three feet high, and twenty-eight broad; its largest pipe is thirteen inches diameter, and it has sixteen pair of bellows.

ORGANZINE, is silk prepared for forming the warp of the stuff designed to be woven in the loom. See SILK.

ORGOL, or ARGOL, the tartar or salt from the lees of wine, used by dyers, in giving a madder-red colour, and by pin-makers in whitening their pins.

The more tartar is separated, the more smooth and palatable is wine. This substance forms a thick crust, remarkably hard, on the sides of the vessels in which wine is kept; and as part of the fine dregs of the wine adhere to it, the tartar of the white wines is of a greyish-white colour, called white argol; and that of red wine of a red colour, and is called red argol. When separated from the vessel in which it is formed, argol is mixed with much heterogeneous matter; from which, for the purposes of medicine and chemistry, it requires to be purified. This purification consists in first boiling the argol in water, filtrating the solution, and allowing the salt to crystallize, which it very soon does, as it requires nearly twenty times its weight of water to dissolve it. The crystals of tartar obtained by this operation, are far from being perfectly pure; and therefore they are again boiled in water, with an addition of clay which absorbs the colouring matter; and thus, on a second crystallization, a very pure white salt is obtained. These crystals are called *cream of tartar*. Argol, in fine, consists of fixed vegetable alkali, super-saturated with the pure acid of tartar, and joined by a great deal of earthy impurities and colouring matter. The white argol is preferable to the red, as containing less of the drossy or earthy matter. The marks of good argol of either kind, are its being thick, brittle, hard, brilliant, and a little earthy. That brought from Germany is esteemed the best, on account of being taken out of those great tuns, wherein the Rhenish wines are deposited in the merchants' vaults, and in which it is sometimes permitted to collect to so extraordinary a consistence, that when in course of time the wood-work and other materials, whereof the tuns are formed, become rotten, the wine is actually contained and retained by the coats of tartar, which, of themselves, constitute perfect vessels. See DYEING. For the foreign names of the article, see ARGOL.

ORICHALCUM. See ZINC.

ORIGANUM. An essential oil is kept at the shops, under the name of oil of origanum, which is simply the oil obtained from the leaves of the wild-marjoram.

This oil has lately been found to be an effectual application externally for several complaints in veterinary science, as well as in surgery. It has been said to cure blood-spavins in horses, when applied early, and without intermission. It will almost invariably cure chilblains in the human species, if applied in an early stage of the disorder.

ORPIMENT, (GER. DU. DA. and SW.

Opement. FR. *Orpiment.* IT. *Orpimento.* SP. *Oropimente.* PORT. *Ouopimente.* RUS. *Auripigment, Opement.* POL. *Aurypigment, Zlotokost.* LAT. *Auripigmentum,*) a semi-metal, usually found in copper mines. Its colour is always yellow, intermixed with shades of other colours, such as green, red, orange, &c. What is usually called red orpiment, or red arsenic, is only the yellow orpiment, heated to a great degree, and put into a crucible with oil of hemp-seed, olives, or nuts. Painters, farriers, and others, use much of this mineral; but as it is a violent corrosive, it should be employed with great precaution. White orpiment is the same with arsenic. See ARSENIC.

ORRIS, or IREOS, (GER. *Violenwurzel.*

DU. *Violhoortel.* DA. *Violdod.* SW. *Violdot.* FR. *Iris de Florence.* IT. *Ireos.* SP. *Raiz delirio de Florencia.* PORT. *Lirio florentino.* RUS. *Fialkowi koren.* POL. *Fiolkowy korzen.* LAT. *Iris florentina,*) a sweet-scented powder, produced by pulverising a root of the same name. This root is white, about the thickness of a man's thumb, of an oblong form, and is brought to us dry from Florence, in the neighbourhood of which city it grows spontaneously. When taken out of the earth, this root is encumbered with many fibres, which are cut off, and it is then dried. Orris-root should be chosen plump, heavy, compact, clean, very white, of a sweet and pleasing violet-like odour, and of a sharp and rather bitterish taste. The dry roots of the Florence orris are entirely mild, and said to be a medicine of good service in disorders of the breast. They are much employed in scenting hair-powder, and other articles of perfumery, as well as for flavouring liqueurs, &c. It produces an essential oil in great abundance, which may be extracted with little difficulty.

ORRIS, a peculiar pattern in which gold and silver laces are worked. The edges are usually ornamented with conical figures placed at equal distances, with spots between them.

ORSEDEW, ORSIDUE, or MANHEIM-GOLD, (GER. *Flittergold.* DU. *Klatergoud.* DA. and SW. *Flitterguld.* FR. *Oripeau, Oliguant.* IT. *Orpello.* SP. *Oropel.* PORT. *Quropel.* RUS. *Schumnuha krasnaja.* POL. *Paziotka, Flaterki.*) This article is

also called *Dutch-gold, Dutch-leaf,* and *Dutch-metal*; appellations which it has obtained, from our being supplied with it in the greatest abundance by the Hollanders. The first syllable *or*, is the French for gold, and, from whatever source the succeeding ones may have been derived, the word is used to signify mock, or fictitious gold. With respect to the designation of *Manheim-gold*, it is derived from the name of a German town, where vast quantities of the article are manufactured. It is likewise called *leaf-brass*, from the circumstance of the ingredients, of which it is made, being the same as those employed in the manufacture of brass.

The few authors, who have treated of the manufacture of this article, differ materially in their accounts. One gives the following: "By melting yellow copper in various proportions with red copper, some ductile alloys result, the colours of which approach more, or less, to that of gold. Equal parts of brass, and copper, form a ductile metal of the colour of gold, and pale. Three-fifths of red copper, with two-fifths of yellow copper, yield an alloy, the colour of which may be confounded with that of gold. One part of yellow copper and two of red copper give a deeper red colour. If, in place of employing yellow copper, zinc is used, and alloyed by fusion with copper, we may also form *Manheim-gold*. In the latter case we must cover the two melted metals with a layer of charcoal, for the purpose of preventing the loss of a great part of the zinc, and also in order to facilitate the combination. The most advantageous proportion for this composition is, to employ one part of zinc, and four of red copper; this mixture is afterwards covered with charcoal in powder, and melted."

Another informs us, that "There is, besides the true *leaf-gold*, another kind in use, called *Dutch-gold*, which is copper gilt, and beaten into leaves like the genuine. It is much cheaper, and has, when good; greatly the effect of the true, at the time of its being laid on the ground; but with any access of moisture, it loses its colour, and turns green in spots; and indeed in all cases its beauty is soon impaired, unless well secured by lacquer or varnish. It is nevertheless serviceable for coarser gilding, where larger masses are wanted, especially where it is to be seen by artificial light, as in the case of the theatres; and if well varnished, will then, in a great measure, answer the end of the genuine kinds."

To the foregoing may be added the following account, from Aikin's Chemical Dictionary, article Copper. "Mixtures chiefly of these two metals (copper and zinc) are used to form variety of gold-coloured alloys known by the names of *Manheim gold, Tombac, tinsel, similor, Prince Rupert's metal, Pinchbeck, &c.*;

but the precise composition varies according to the fancy, or the experience, of different manufacturers. The Dutch gold may be beaten into extremely fine leaves, which, when fresh, have nearly the brilliancy of gold leaf, and are used as a cheap imitation of it; but they tarnish very soon. The mixture may be made by directly melting copper, and zinc, or by mixing brass, and copper. In either case, the copper should be melted first, and the zinc added afterwards; the whole stirred together with wood, covering it with a little charcoal, and poured out immediately to prevent the loss by the burning off of the zinc.

Which, of all the several processes recommended, is most likely to prove successful, it is not for us to determine, but each of them being applicable to a different species of the article, may be perfectly reducible to practice, and may turn out equally advantageous to the manufacturer. As we have already observed, orsduie is imported in vast quantities from Holland. The article is sold in books like leaf-gold; and it is imported in casks and cases, with scratch brushes. We frequently export twenty tons at one shipment of this commodity to the East Indies, where it is in great demand for the dresses of their dancing-girls, their priests, and their gods. It is used in England for philosophical purposes, for gilding the leaves, &c. of low-priced books, for coarse gilding of picture-frames, for covering gingerbread, cockades, &c. Nearly the whole of the orsduie sold throughout Europe (that brought from Holland not excepted) is manufactured in Germany.

ORYCTOGNOSY signifies the science of classifying minerals, necessary in various branches of commerce and manufacture: *ex. gr.* to the chemist, the lapidary, the miner, &c.

OSIERS, (GER. *Kanegen, Weidengerten, Korbgarten.* DU. *Teenen.* DA. *Vien.* SW. *Korpgühl.* FR. *Osiers, Rouettes.* IT. *Vinchi, Vinium.* SP. *Mimbres.* PORT. *Vines*;) twigs used in making baskets, and produced by the willow-tree. See BASKETS.

OSLEON-IRON, a particular sort of bars of iron made on purpose for the manufacture of wire.

OSMIUM. This metal was first discovered by Mr. Tennant, in platina, in the year 1804; it is of a dark-blue colour. It is insoluble in any of the acids; with difficulty fusible; and unchangeable in the most intense heat, unless in contact with air, when it combines with oxygen, and is converted into a volatile oxide, having a peculiar pungent smell. Its oxide is soluble in water, has a sweet taste, and, forms, with potash, an orange-coloured solution. It imparts to the skin an indelible stain of a dark colour, and produces a purple with a solution of galls, which soon after changes to a bright deep blue. It has not hitherto been applied to any use in the arts.

OSNABRUG or OSNABURGH LINEN, (GER. *Osnabrucker lienwand.* FR. *Colettes.* SP. *Creguelas agantadas.* PORT. *Ancagens cruas*;) a sort of coarse linen-cloth, manufactured at Osnaburgh, in Germany, whence its name. The Germans sell this linen to the English, the Dutch, and the Spaniards, who, for the most part, send it to their respective colonies. We have an imitation of this linen in many parts of Great Britain, called Osnaburgh.

OSTRACITES, the name of a kind of cadmia, found at the bottom of furnaces where copper has been purified.

OSTRICH - FEATHERS, (GER. *Straussfedern.* DU. *Struisveeren.* DA. *Strudsjere.* SW. *Strussfjädar.* FR. *Plumes d'autruche.* IT. *Piume di strozzo.* SP. *Plumas de avestruz.* PORT. *Plumas de abestrux.* RUS. *Strusovii penja.* POL. *Strussie piora*;) the fine feathers of the ostrich; the ancients used those plumes on their helmets; our military wear them in their hats; and the ladies make them an ornament in their head-dress. The colours are generally black, and white; though some of them are said to be grey.

Ostrich-feathers are dyed and dressed by the feather-dressers. They are brought to us from Africa, and particularly from the coast of Barbary. They are more prized as ornaments than those of any other bird; not only on account of their brilliant white hue, but their length, their suppleness, the beauty of their fringe, and the facility with which they may be cleaned, or stained of any colour, without the opposition of that tenacious oil so common in other species of feathers. They are divided into those of the male bird, those of the female, and ostrich-down or estrich. The feathers of the male ostrich are peculiarly white, and of the finest quality: the best of this sort are the feathers taken off the backs and the upper part of the wings of the bird: the less these are exposed to friction of any kind, the better they preserve their original beauty. The second quality of this sort consists of the feathers plucked from the wings only; the third from the extremity of the wings, and the fourth from the tail; these last are re-divided into three kinds according to quality. The finest feathers of the female have usually a greyish cast, which considerably detracts from their beauty and value. These are divided into white, grey, and feathers of a mixed hue. An account of the species of down called ostrich-down, will be found under the head of ESTRICH.

From the neck and thighs of the ostrich are plucked feathers of a soft consistence nearly in the form of a skin, the quills of which have not attained to a state of perfection in point of size. Immense quantities of ostrich-feathers are bought up by the merchants of Leghorn, who procure them from Jew dealers established in several parts

of Africa, especially in Tunis, Alexandria, and Madagascar. See title AFRICA.

OTTA, or OTTAR of ROSES, the essential oil of roses. It comes to us under this name from Bengal, and is of too high a price to become an article of commerce in this country. From a variety of accounts we learn that it is obtained in the usual manner, viz. by the distillation of rose-leaves with water. The quantity of essential oil to be obtained from the rose is very precarious and uncertain, as it depends not only on the skill of the distiller, but also on the quality of the roses, and the favourableness of the season; even in Europe, when the chemists are so perfect in their art, Hoffman obtained above two ounces from 100 lb of flowers. The roses, being stripped of their calyxes, and only the leaves used.

It is said to be equal in fragrance to the new-blown rose. This may be true of the oil when newly distilled; but in general the difference in scent appears to be nearly as great as between most other essential oils, and the vegetables which afford them.

OTTER-SKINS. (GER. *Gemeine Otterfelle*, *Fischotter*. DU. *Ottervellen*, *Vischotter*. DA. *Odderskind*. SW. *Utterskin*. FR. *Peaux de Loutre*. IT. *Pelli di Lontra* o *Lodra*. SP. *Pieles de Nutria*. PORT. *Pelles de Contra*. RUS. *Wüdrüi*. POL. *Wydra*. LAT. *Lutrae pelles*.) The otter is an amphibious animal, of which there are three species. The common otter is found in almost every part of Europe, as well as in the colder regions of Asia, inhabiting the banks of rivers, and feeding principally on fish. It occurs also in the northern parts of America, and particularly in Banda, where it appears to arrive at a larger size than in Europe. In the river Euphrates, on the contrary, it is found to be no larger than the domestic cat. The general length of the otter is about two feet from nose to tail, and of the tail about sixteen inches. Its colour is a deep brown, with a small light-coloured patch on each side of the nose, and under the chin.

The small otter, very much resembles the common otter, but it is smaller; the body is of a dusky colour, but with a considerable cast of tawny. It measures about a foot in length. In North America this species bears the name of minx. In Europe, the smaller otter is chiefly found in Poland and Lithuania. Its fur is very valuable, and next in beauty to that of the sable.

The sea-otter is the largest of the otters, measuring about three feet from the nose to the tail, and the tail thirteen inches. The colour of this species is a deep, glossy, brownish-black, the fur being extremely soft, and very fine; on the forehead is generally a cast of a greyish or silver colour. They inhabit, in great abundance, Bering's islands, Kamtschatka, the Aleutian and Fox islands, between Asia and America. They

land also in the Kurile islands; but are never seen in the channel between the north-east of Siberia and America. This animal is killed for its skin, which is one of the most valuable furs. They are said to be chiefly sold to the Chinese.

Otter-skins are mostly employed in trimming or lining garments; and vast quantities of the fur which they yield is consumed by hatters, who either use it as an entire substitute for, or mix it in a moderate proportion with, beaver.

OVER-HALE, in the sea language. A rope is said to be overhauled when drawn too stiff, or haled the contrary way.

OVER-RAKE, among seamen: when a ship riding at anchor, so overheats herself into a head-sea, that she is washed by the waves breaking in upon her, they say the waves over-rake her.

OUBANG, is a gold coin of the largest sort at Japan: its figure is oval, and its value is ten coupangs (which are pieces of gold of the same figure) but ten times less in their weight, or one-fifth less in their surface; the oubang is worth 106 rix-dollars in India, and the coupang ten.

OUNCE, a small weight, the sixteenth part of a pound *avoirdupois*; and the twelfth part of a pound *troy*; the ounce *avoirdupois* is divided into eight drachms, and the ounce *troy* into twenty pennyweights.

OUNCE-SKINS. The ounce is scarcely inferior in size to the leopard. Its colour is dull white, with a slight yellowish or tawny cast, and the whole is scattered over with differently-sized spots, and markings of black. About the head these spots are small, numerous, and roundish: along the back they form a kind of abrupt or irregularly interrupted stripes, whilst on the sides and limbs they are variously shaped, forming in some places angular, and others somewhat round or oval marks, with a central space included: and on the legs and tail they are black and scattered. This animal is a native of several parts of Africa, and Asia. The skins are usually applied to the same purposes as those of the leopard, and lynx.

OUTLICKER, in a ship, a small piece of timber made fast to the poop, and standing out right astern. At the outmost end thereof is a hole, into which the standing part of the sheet is reeved.

OUTNAL-THREAD, the Flemish and Dutch-brown flaxen thread.

OWLERS, are those persons who convey wool secretly to the sea-side, in order to export it. This is now a capital offence, particularly if the offenders neglect to surrender after proclamation made for that purpose. See WOOL.

OWNERS OF SHIPS. Owners of ships are particularly interested in the following acts of parliament. 7 Geo. 2. c. 15.—21 Geo. 3. c. 29.—26 Geo. 3. c. 60. amended

by 26 Geo. 3. c. 86. — 34 Geo. 3. c. 68. — and 53 Geo. 3. c. 159.

The first is, *An Act for farther securing the Property of the Owners in such Ships or Vessels as are liable to forfeiture, for importing Spirits, or other Goods, by the Misconduct of the Master, Mates, or Seamen; by which it is enacted, That,*

1. If the master of any vessel shall conceal, or suffer to be concealed, foreign spirits, tea, or coffee, above two gallons of spirits for each seaman, above 6lb. of tea, or 19lb. of coffee; or, if the master, &c. of such ship or vessel shall clandestinely import, or suffer to be clandestinely imported, therein, any such foreign spirituous liquors, or any other uncustomed goods, whereby the owners become liable to forfeit the ship; he shall forfeit all his wages to the owners, with treble the value of the uncustomed goods on board.

2. If the mates or seamen shall conceal any of the said goods, (above the quantity allowed by law,) they shall forfeit their wages, and also 10s. for every gallon of foreign spirits, and 10s. for every pound of tea or coffee.

3. And, if in time of war, the owner may send them to serve three years on board a man of war, except such as are old, disabled, or unfit for service.

4. A printed copy of this act is to be put up on some conspicuous part of every British trading-vessel; and, when any clauses become defaced, the master shall cause the same to be replaced, under the forfeiture of 1s. per day during such omission, to be paid to the owner.

5. Mates or seamen, who shall refuse to pay the penalties, &c. may be committed for three months.

6. Justices may mitigate penalties, but not reduce them under one-half.

7. Proceedings of the justices not to be quashed for want of form, and to be final.

8. Commencement of actions is limited to six months; the party sued may plead the general issue; and, on verdict against the plaintiff, recover treble costs.

N. B. But, by a discretionary power invested in the honourable commissioners, the stores before-mentioned are allowed duty free only for the use of the crew during the delivery of the cargo: as soon as the goods are all out, and the voyage thereby at an end, the stores that shall remain unconsumed when the ship is cleared are to be entered, and not more left than will exceed 40s. in customs and excise, by way of clearing-stores.

If a ship arrive in ballast, she is to be considered as fit for clearing, and to be allowed only the clearing-stores as above-mentioned.

Where spirits are found on board, no wine is to be allowed as clearing-stores. But, where there are no spirits, then two dozen

quarters of ordinary wine, for the use of the crew on board, in short voyages, from Holland, Germany, Flanders, France, &c.

The second is, *An Act to explain and amend an Act, made in the seventh year of His late Majesty's reign, intituled, An Act to settle how far Owners of Ships shall be answerable for the Acts of their Masters or Mariners; and for giving a further Relief to the Owners of Ships.* 26 Geo. 3. c. 60. By which it is enacted, That,

1. *Owners not answerable for loss of goods, by master or mariners, beyond the value of ship and freight.*—No person, who is owner of any ship or vessel, shall be liable to answer or make good any loss or damage, by reason of any robbery, embezzlement, secreting, or making away with, of any gold, silver, diamonds, jewels, precious stones, or other goods or merchandise, which shall be shipped on board any ship or vessel; or for any act, damage, or forfeiture, done or incurred, from the passing of this act, without the knowledge of such owner; farther than the value of the ship or vessel, with all her appurtenances, and the full amount of the freight due, or to grow due, for the voyage wherein such robbery, embezzlement, secreting, or making away with, shall be made, although the master or mariners shall not be concerned in, or privy to, such robbery, embezzlement, secreting, or making away with.

2. *Owners not answerable for loss by fire.*—No owner of any ship or vessel shall be liable to answer or make good any loss or damage which may happen to any goods or merchandise whatsoever, which shall be shipped and put on board such ship or vessel, by reason or means of any fire happening to, or on board of, the said ship or vessel.

3. *Masters or owners not answerable for loss of goods, unless their nature, quality, and value, are made known upon shipping.*—No master or owner of any ship or vessel shall be subject or liable to answer for, or make good, any loss or damage which may happen to any gold, silver, diamonds, watches, jewels, or precious stones, which shall be shipped on board any such ship or vessel, by reason of any robbery, embezzlement, making away with, or secreting thereof, unless the owner or shipper thereof shall, at the time of shipping the same, insert in his bill of lading, or declare in writing to the master or owner of such ship or vessel, the true nature, quality, and value, of such gold, silver, diamonds, &c.

4. *Where ship and freight are not equal to all the losses.*—If several freighters or proprietors of any such gold, silver, &c. shall suffer any loss or damage by any of the means aforesaid, in the same voyage (fire only excepted,) and the value of the ship or vessel and freight shall not be sufficient to make full compensation to all of them, then such freighters or proprietors shall receive satis-

faction thereout in proportion to their respective losses; and, in every such case, it shall be lawful for such freighters or proprietors, or any of them, on behalf of himself and all other such freighters or proprietors, or for the owners of such ship, to exhibit a bill, in any court of equity, for a discovery of the total amount of such losses, and of the value of such ship or vessel, appurtenances, and freight, and for an equal distribution and payment amongst such freighters or proprietors, in proportion to their respective losses, according to the rules of equity. Provided, that if any such bill shall be exhibited on behalf of the part-owners of such ship, the plaintiff or plaintiffs shall thereto annex an affidavit, that he or they do not collude with any of the defendants; and shall thereby offer to pay the value of such ship or vessel, appurtenances, and freight, as such court shall direct.

5. Remedies against the master and mariners. — Provided, that nothing shall extend to discharge any remedy which any person or persons now, hath or have, or may hereafter have, against the master or mariners of such ship, in respect of any embezzlement, secreting, or making away with, any gold, silver, &c. shipped or loaden on board such ship or vessel; or on account of any fraud, abuse, or malversation, of and in such master and mariners respectively; but it shall be lawful for every such person or persons, so injured, to pursue such remedy against the said master and mariners, as they might have done before the making of this act.

ADJUDGED CASES RELATIVE TO OWNERS OF SHIPS.

Goods spoiled by default of a master. — If goods are spoiled by default of a master of a ship employed by the owners, the owners are liable; but the action must be brought against all the part-owners, who make but one master.

Part-owners not agreeing about a voyage. — If several part-owners wish to send a ship on a voyage, but two or three other part-owners refuse their consent, the former may send her on the voyage; but they must enter into a recognizance in the admiralty for her safe return.

A part-owner of a ship sued the other owners for his share of the freight on finishing her voyage; but the other owners had fitted her out, in which, complainant would not join; whereupon the other owners complained in the admiralty; and, by order there, they gave security, if the ship perished in the voyage, to make good to the plaintiff his share, or to that effect; in such a case, by the law marine and course of the admiralty, the plaintiff was to have no share in the freight. It was referred to Sir Lionel Jenkins to certify the course of the admiralty, who certified accordingly, and that it was so in all places; for otherwise there

would be no navigation; whereupon the plaintiff's bill was dismissed.

In what case the owner of a ship, letting it to another, is still liable for loss. — The defendant was sole owner of a ship which he let out to one Fletcher for a voyage for a certain sum, and Fletcher was to have the benefit of carrying goods. The plaintiff sent a quantity of moidores, and had bills of lading signed by the captain: and, many of the moidores not being delivered, according to consignment, an action was brought against the defendant, the owner of the ship, to make him liable, as far as the ship and freight were worth, according to 7 Geo. 2. c. 15.

For the defendant, it was insisted, that, though the ship was his property, yet that Fletcher is for this purpose the owner. But, it appearing that the defendant had covenanted for the condition of the ship and the behaviour of the master, the chief-justice held he was liable to the plaintiff: and the freight he had in general from Fletcher was sufficient, though the identical freight for the gold belonged to the other; and Fletcher had only the use of the ship, but no ownership. 2 *Strange's Rep.* 1251.

The registered owner of a ship chartered her to the captain at a certain rent, for a certain number of voyages. Determined, that the owner was not liable for stores furnished to the ship by order of the captain during the charterparty. *Fraser v. Marsh.* 13 *East. Rep.* 288.

A ship was chartered to the commissioners of the navy as an armed vessel, and by the misconduct of the persons on board, injury was done to another vessel while king's pilot and a commander of the navy were on board. An action for the injury lies against the owners. *Fletcher v. Braddick.* 2 *N. R.* 182.

Repairing a ship. — If a ship be repaired in the River Thames, and fitted out there with new rigging and apparel, the ship itself is not liable, but the owners are. If she be repaired abroad, the ship is liable, and the master may hypothecate her for payment of the charges.

The repairer of a ship may sue either the master who employs him or the owners: but, if he undertake it on a special promise from either, the other is discharged.

An action was brought by a shipwright for repairing the defendant's ship in his dock. About three hours before the ship's repairs were finished, a fire happened, and she was burnt. Notwithstanding which, the court held that the owner was liable to pay for the repairs that had been done.

Sole registered owner gave orders for materials and work to be done, for a ship's repair; but before the whole of the articles were delivered, he conveyed the vessel with its furniture to another by bill of sale, which was registered. Held that vendee was not liable for any goods furnished previous to

legal title being conveyed to him, and registered to him according to the statutes. *Trewhalle v. Rowe*, 11 *East. Rep.* 435.

The legal title to a ship remained in the vendors for a month after the sale, upon the face of the register, according to 34 *Geo. 3.*; but the vendors held not liable during that period for repairs ordered by the captain under the direction of the vendee, (who is for this purpose to be considered as a stranger to the legal owners,) and consequently had no authority to bind them. *Young v. Brender*, 8 *East. Rep.* 10.

Owners liable for provisions, &c. bought by the master. — If the master of a ship buy provisions for her, and have money of the owners to pay for the provisions, but sail without paying the money, the owners are liable to pay, in proportion to their respective shares in the ship, the master being but a servant to the owners. 2 *Vern. Rep.* 643.

Master not liable for stores ordered before, but delivered after, his appointment as master.

— Lord Mansfield, in delivering the opinion of the court in the case of *Farmer and another against Davis*, where goods were ordered for a ship by the owner before the appointment of the captain, and some of which goods were delivered after his appointment, said, “Where a captain contracts for the use of a ship, the credit is given to him, in respect of his contract: it is given to the owners, because the contract is on their account; and the tradesman has likewise a specific lien on the ship itself. Therefore, in general, the tradesman who gives that credit, debits both the captain and the owners. Now, what is this case? The captain made no contract personally: the owners contracted for their ship: the credit was given to them only: and there is not a shadow of colour to charge the captain with any part of these goods.”

Master has no lien on the ship for his wages; nor for money paid for stores and repairs. — *Wilkins and others, assignees of Brooke, a bankrupt, against Carmichael.* The question in this case was, whether a captain, having paid for stores supplied, and repairs done, to a ship in England, and having wages due to him, has such a lien on the ship as to be entitled to keep her till he is paid?

Lord Mansfield said, “Notwithstanding the strongest inclination that the defendant (the captain) should have full satisfaction, we are not able to find ground on which we can give judgment in his favour. 1. He has set up a lien upon two sorts of claim; viz. wages, and stores and repairs. As to wages, there was no particular contract that the ship should be a pledge; there is no usage in trade to that purpose; nor any implication from the nature of the dealing. On the contrary, the law has always considered the captain as contracting personally with the owner; and the case of the captain has, in that respect, been distinguished from that

of all other persons belonging to the ship; this rule of law may have its foundation in policy, for the benefit of navigation; for, as ships may be making profit and earning every day, it might be attended with great inconvenience, if, on the change of a captain for misbehaviour, or any other reason, he should be entitled to keep the ship till he is paid. As to stores and repairs, it is a strong answer to that claim, that, when the demand was made to the assignees, the captain had not paid the tradesmen's bills. But if there was any lien originally, it was in the carpenter. The captain could not, by paying him, be in a better situation than he was, and he had parted with the possession; so that he had given up his lien, if he had one: the other creditors had none. If the defendant is liable to the tradesmen, it is by his own act. Work done for a ship in England is supposed to be done on the personal credit of the employer: in foreign parts the captain may hypothecate the ship. The defendant might have told the tradesmen, that he only acted as an agent, and that they must look to the owner for payment.” — Judgment for the plaintiff.

Owners liable for necessities ordered by the master, whether they know of it or not. — The plaintiffs being rope-makers, supplied the ship *Henry and Thomas* with cables to the value of 5*l.* 8*s.* 5*d.*, by the order of *Thomas Harwood*, the captain, and made *Harwood* and the owners of the ship (the defendant) the debtors, in the usual manner, without naming the owners, or knowing particularly who they were. The ship *Henry and Thomas* had been let by the defendants to *Harwood* upon certain articles, in which it was mutually covenanted between them as follows: 1*st.* The owners covenanted with *Harwood*, that, on his performance of the covenant stipulated on his part, he should have the sole management of the ship, and employ her for his sole benefit and advantage for the space of eleven years, if he should so long live, and the ship should not be lost. The covenants on the part of *Harwood* were (amongst others), to pay a yearly rent of 36*l.* per cent., at stated periods; that he would, at all times, at his own cost and charge, repair, maintain, and keep, the vessel and her rigging, &c. in good and sufficient repair. The plaintiffs had no notice of this contract at the time they furnished *Harwood*, the captain, with the goods. — The question was, whether the defendants were liable to this debt?

Lord Mansfield, in delivering judgment, said, “This case was reserved, not with a view to the particular matter in dispute, or the parties now before the court, but in consideration of a general anxiety in the owners of ships, employed in this trade, to know how far they are by law liable, for the acts of their respective lessees. In that point of view we have considered the case very

particularly; and, after the fullest deliberation, we think it impossible to say that the plaintiffs are not entitled to recover. Whoever supplies a ship with necessaries has a treble security. 1. The person of the master. 2. The specific ship. 3. The personal security of the owners, whether they know of the supply or not. — 1. The master is personally liable as making the contract. 2. The owners are liable in consequence of the master's act, because they choose him; they run the risk, and they say whom they will trust with the appointment and office of master. Suppose the owners in this case had delivered the value of the goods in question, in specie to the master, with directions for him to pay it over to the creditors, that the master had embezzled the money; it would have been no concern of the creditors; for they trust specifically to the ship, and generally to the owners. In this case, the defendants are the owners: and there happens to be a private agreement between them and the master, by which he is to have the sole conduct and management of the ship; and to keep her in repair, &c. But how does that affect the creditors, who, it is expressly stated, were total strangers to the transaction? In answer to the observation, that the plaintiff must have known the real situation of the matter in this case, from the general usage and custom of the country in that respect. To be sure, if it appeared that a tradesman had notice of such a contract, and, in consequence of it, gave credit to the captain individually, as the responsible person, particular circumstances of that sort might afford a ground to say he meant to absolve the owner, and to look singly to the personal security of the master: but here it is stated, that the plaintiff had no notice whatever of the contract. The owners themselves are aware of their being liable at the time; they choose a master to whom they agree to let the ship, and trust for their security to the covenants which they oblige him to enter into; these covenants are, that he shall be obliged to keep the ship in repair, and deliver her up, at the end of the term, in as good condition as when delivered to him. This is not all, for they indemnify themselves against the debts of the master, and against his being taken in execution; for if he does not perform all and every the covenants in the agreement (beside their remedy against him upon the ship), the consequence (beside their remedy against him upon the covenant) is, that the contract and agreement are to be absolutely at an end, and they are to take possession of the ship. Suppose the ship had been impounded in the admiralty court, and that happened at the end of the term; or suppose the captain had broken a covenant, which put an end to the agreement, the defendant could never have taken the ship out of court, without paying the debt for which

the ship was impounded. We are all of opinion, therefore, that under these circumstances, there is no colour to say that the creditors shall be stripped of the general security they are, by law, entitled to against the owners." *Rich, executor, v. Coe and another.*

The stat. of 34 Geo. 3. c. 68. gives a summary conviction against any master of a vessel, "who, having received the certificate of its register, wilfully detains, and refuses to deliver up, the same to the proper officers, &c., on the requisition of the owner or major part of owners, &c." But this will not authorise the conviction of a master who refuses to comply with the requisition of the sole owner to deliver up such certificate to him; even though expressed to be for the purpose of providing the indorsement necessary to be made at the custom-house for transfer of the ship. *Rex. v. Rixley, 13 East Rep. 91.*

The stat. 34 Geo. 3. applies to the sale of the entirety of a ship in the same port, as well as to the sale of a share therein. *Hubbard v. Johnson, 5 Taunt. 177.*

The ship-register acts, so far as they apply to defeat titles, and create forfeitures, are to be construed strictly, as penal, not literally, as remedial, laws. 3 *Taunt. 220.*

The most recent statute on this subject is the 53 Geo. 3. c. 159., the preamble of which statute states it to be an amendment of the 7 Geo. 2. c. 15. and 26 Geo. 3. c. 86. It enacts, that owners of ships thenceforward shall not be liable to make good any damage or loss occasioned without their fault, further than the value of their respective vessels, and the freight due, or growing due, for and during the voyage in prosecution, or contracted for, at the time of such damage or loss. sec. 1.

The value of the carriage of goods, and also the hire due, or to grow due, (except only such hire, as in the case of a vessel hired for time, may not begin to be earned till the expiration of six calendar months after the happening of the loss or damage,) shall be considered as freight. sec. 2.

Separate losses or damages, arising from distinct accidents, to be satisfied and compensated separately and distinctly. sec. 3.

But not to take away general responsibility from masters or mariners, being owners or part owners; and not to extend to owners of lighters, and other vessels used in inland navigation, nor to vessels not duly registered. sec. 4 & 5.

Actions may be brought for damage by persons suffering loss, though others have sustained loss by the same accident.

But if the ship, &c. &c. shall not be of sufficient value to make compensation to all the suffering parties, a bill in equity may be exhibited by any of them for a rateable distribution. And such court may take all measures necessary for ascertaining the said

valued, and may require securities till the whole be paid into court. sec. 8, 9, 10.

Any court of equity competent to take cognizance under this act. sec. 15.

OWSE, among tanners, signifies oak-bark beaten, or ground small for use.

OWSER, among tanners, is bark and water mixed in a tan-pit.

OXALIC ACID. See ACIDS.

OXEN. (GER. *Ochsen*. DU. *Ossen*. DA. *Oxer*. SW. *Oxar*. FR. *Bœufs*. IT. *Bugli*. SP. *Bucies*. PORT. *Bois*. RUS. *Buki*. POL. *Woly*. LAT. *Boves*.) It is not necessary to treat this title much at length, as the subject is considered under other heads, especially CATTLE, and AGRICULTURE.

The domesticated ox is met with in various parts of the world, and runs into as many varieties as the sheep; differing widely in size, form, and colour, according to climate and other circumstances. The British, and Irish, breeds of horned cattle have been much improved of late years by a foreign mixture. In Ireland the ox gives rise to a vast commerce, both in the flesh, which is salted and barrelled for exportation, and in the hides, of which vast quantities are annually sent to England, as well as to other parts of Europe.

OXYGEN, a simple substance, which can only be obtained in combination with other bodies, or in the state of gas. It exists naturally in the form of gas, forming about one-fourth of the composition of the atmosphere. It is evolved in great abundance from the leaves of vegetables, by the action of light. It may be obtained from its combinations in the state of gas by exposing substances which contain it, as manganese, red oxide of mercury, or the salt termed oxy muriate of potash, to heat in a pneumatic apparatus; by which oxygen gas is copiously disengaged, and may be collected in the usual way.

Oxygen gas is insipid, colourless, and inodorous. 100 cubical inches, at a mean temperature and pressure, weigh 35.75 grains. It may be indefinitely expanded or condensed. It is essentially necessary for the respiration of animals; an animal confined in oxygen gas will live three times as long as in an equal portion of atmospheric air. It is also the most powerful supporter of combustion. It was formerly considered as the only acidifying principle, but the discoveries of Sir H. Davy have shown, that hydrogen has, with certain substances, the same properties. Combined with metallic substances, it forms compounds, termed oxides. This may take place on mere exposure to the atmosphere, or by the influence of heat. The oxidation, or rusting of iron, when exposed to a damp atmosphere, is an instance of the former; and the change of lead, by burning, into red lead, exemplifies the latter. The great waste of this substance constantly taking place by the respiration of

animals and combustion, is principally repaired by the function of the leaves of vegetables, which decompose carbonic acid gas, evolving the oxygen, and retaining the carbon.

OXYMEL, a compound of honey and vinegar. It is frequently combined with other medical ingredients, and then named from them, as oxymel of squills, &c.

OYSTER. (*Oysters*. GER. *Austern*. DU. *Oesters*. DA. *Osters*. SW. *Ostron*. FR. *Huitres*. IT. *Ostriche*. SP. and PORT. *Ostras*. RUS. *Ustrizii*. POL. *Ostrygi*. LAT. *Ostrea*.) There are reckoned more than thirty species of oysters, principally distinguished by peculiarities in their shells. The common oyster is excellent food; and is eaten both raw and variously prepared.

Oysters usually cast their spawn in May, which at first appears like drops of candle-grease, and sticks to any hard substance it falls upon. These are covered with a shell in two or three days; and in three years they are large enough to be brought to market. As they invariably remain in the places where they are laid, and as they grow without any other seeming food than the afflux of sea-water, it is the custom at Colchester, and other parts of England, where the tide settles in marshes on land, to pick up great quantities of small oysters along the shore, which, when first gathered, seldom exceed the size of sixpence. These are deposited in beds where the tide comes in, and in two or three years grow to a tolerable size. They are said to be better tasted for being thus sheltered from the agitations of the deep: and a mixture of fresh water entering into these repositories, is said to improve their flavour, and increase their growth and fatness. The oysters, however, which are prepared in this manner, are by no means as large as those found sticking to rocks at the bottom of the sea, usually called rock-oysters. These are sometimes found as broad as a plate, and are much admired as excellent food. In parts of the East Indies there are found oysters, some of whose shells have measured two feet over. The oysters found along the coast of Coromandel, are capable of furnishing a meal for eight or ten men, but their flavour is not by any means so delicate as that of the European oyster.

There is scarcely a part of the world which does not furnish oysters; and the varieties noticed in this delicious fish, in different places, are truly surprising.

Oysters with greenish shells are much sought after in many parts of Europe, especially in France. In order to procure them of this description, the French bury the white oysters in pits three feet deep, situated on the sea-shore, in such a manner that the water only reaches them during the spring-tides. A sort of sluice is formed at each pit, which is so contrived, that on the ebbing of the tide, the pit is only covered by about

half the quantity of water that inundated it at the flowing. The pits now become green, and in the course of two or three days the oysters likewise acquire a greenish hue. After this they are suffered to remain in the pits about six weeks. The best oysters should be as fresh as possible, of a middling size, tender, humid, and delicate. Such oysters as are taken at the mouths of rivers are the most esteemed; for this fish delights in fresh water, and, as before observed, fattens in it more kindly than in the sea. The oyster-fishery is carried on in a very considerable manner along the British and Irish coasts; but more particularly in Wales, and the eastern part of England, whence the oysters are sent to market either fresh, or pickled in barrels. The oysters taken on the coast of France are so very poor, that they are frequently brought over to England to be fattened. The Dutch have likewise a few oysters; but they, as well as the French, are obliged to have recourse to the English, for oysters of any delicacy.

British oysters are exported to all parts of Europe, even to Russia, where they are considered a great delicacy.

LAWS RELATIVE TO THE OYSTER FISHERY.

31 Geo. 3. c. 51. and 48 Geo. 3. c. 144.

Punishment for taking oysters illegally.—If any person or persons shall, after the 1st of August, 1791, with any net, trawl, dredge, or other instrument or engine whatever, take or catch any oyster or oyster-brood, within the limits of any oyster-fishery of this kingdom; or shall dredge for oysters or oyster-brood, or use any oyster-dredge, or any net, instrument, or engine whatsoever, within the limits of any such fishery, for the purpose of taking or catching oysters or oyster-brood, although no oysters or oyster-brood shall be actually taken; or shall, with any net, instrument, or engine, drag upon the ground or soil of any such fishery, all

and every such person or persons (other than and except such persons as shall be the owners, lessees, or occupiers, of such fishery, or shall be otherwise lawfully entitled to take or catch oysters therein) shall be deemed and taken to be guilty of a *misdeemeanour*, and shall and may be prosecuted for the same, by indictment at the assizes, or general quarter-sessions of the peace for the county, riding, or division; and such person or persons being lawfully convicted by verdict, or by his or their own confession, shall be punished, for any of the said offences, by fine and imprisonment, or either of them, as the court shall think proper; such fine not to exceed twenty pounds, or be less than forty shillings, and such imprisonment not to be for more than three months, or less than one month.

But by 48 Geo. 3. which is an amendment of 31st, the offence is declared to be a felony, and punishable with seven years' transportation, or three years' imprisonment, at the discretion of the court. *See further, title FISHERY, article Oyster Fishery*, as well for general information as for decided cases.

OYSTER-SHELLS are extremely valuable, both in pharmacy and agriculture. In the former science, they are used as an alkali, and administered in doses of twenty or thirty grains. The way of preparing them is, to select the hollow, or bottom, shells, dry them well, and pound them in a mortar, then pass them through a fine sieve. Some calcine them first: others prefer them in their natural state, supposing the saline properties with which they are imbued to be salutary, and to be evaporated by calcination.

In agriculture, they are found eminently beneficial; 40 bushels of the pulverised shells having been estimated to be equal in effect to eight tons of farm-yard manure. The pulverisation of these shells has lately been resorted to with advantage, and is an employment for the poor in parochial work-houses.

P A C

P, The fifteenth letter of the alphabet. *P. M.* is used to denote *post meridiem*, or afternoon. As a numeral, *P* signifies the same as *G*, viz. 400; and with a dash over it, thus, *P̄*, 400,000. Among physicians, *P* denotes pugil, or the eighth part of a handful; *P. Æ. partes æquales*, or equal parts of the ingredients. *P. P. pulvis patrum*, the jesuit's bark in powder, so called, as these fathers were the first who brought it into Europe. *P. S.* stands for postscript, or something added to a letter.

PACE, a measure taken from the space between the two feet of a man in walking;

P A C

usually reckoned two feet and a half, and in some men a yard, or three feet. The geometrical pace is five feet; and 60,000 such paces make one degree of the equator.

PACK, denotes a quantity of goods, made up in loads or bales for carriage. A pack of wool is seventeen stone and two pounds, or a horse's load.

PACKAGE, among mercantile men, is usually defined, a single lot or parcel of any species of goods made up for exportation, &c. such as a barrel or pipe of wine, a bale of cloth, a case of hats, &c.

As the duties of *scavage*, *package*, *baillage*,

and *portage*, payable at the port of London, have a certain affinity to each other, and are usually levied at one and the same time, the whole of them will be found together in the Appendix to this volume.

For the more certain and for the better levying and collecting the duties of package, scavage, &c. the mayor and commonalty, or their proper officers or deputies, may, by all lawful ways and means, compel persons, suspected of any concealment, colourings, or frauds, to take their oaths upon the holy Evangelists.

The city of London is likewise entitled to the survey of the measures, numbers, and weights, of all merchandise of aliens or denizens, coming into, or going out of, the said city, as well by land, as by water: and also the portage and carriage of all goods of denizens, whose fathers are aliens, born under foreign allegiance, or of aliens born under foreign allegiance in parts beyond the seas, carried in London from the river of Thames to the houses or warehouses of such merchants, and thence to the said river.

PACKET, a vessel appointed by government to carry letters, &c. by sea, from one country to another. By stat. 13 & 14 Car. 2. c. 11. no vessel or boat, appointed and employed ordinarily for the carriage of letters and packets, shall (unless allowed by the officers of customs) import, or export, any goods into, or out of, the parts beyond the seas, under penalty of 100*l.* to be paid by the master of the vessel, with the loss of his place, and all the goods on board the said vessel. By statutes 46 Geo. 3. c. 60. and 56 Geo. 3. c. 9. duties of tonnage are authorised to be laid on foreign packets, lading, or unlading, in the ports of Great Britain.

The British packet boats are stationed as follow:

AT	TO
Dover . . .	{ Calais Ostend
Falmouth . .	{ Lisbon Gibraltar and Mediterranean Madeira and Brazils America Jamaica Leeward Islands
Harwich . .	{ Cuxhaven Sweden
Holyhead . .	{ Dublin
Milford . . .	{ Waterford
Port Patrick .	{ Donaghadee
Weymouth .	{ Guernsey and Jersey.

PADAN, a money of account in the East Indies, at present in little use. A hundred *courons* make one *padan*. See *COURON*.

PADDLE, a kind of oar, used by savage nations in navigating their canoes. The paddle is broader at the end than the common oar, and being employed at the stern of the canoe, not only impels her forwards, but regulates her course in the manner of a rudder.

PADLOCK, (*Padlocks*. GER. *Vorlegeschlossor*. DU. *Hangsloten*. DA. *Hængelaas*. SW. *Hänglås*. FR. *Cadenats*. IT. *Lucchetti*. SP. *Candados*. PORT. *Caddeados*. RUS. *Wissjatschtschiü samki*. POL. *Kłotki*.) a sort of lock, hung on a staple, to hold on a link. Padlocks are made of brass, iron, &c. Those of the latter sort are the most common, and are generally japanned over to preserve them from rust, and to give them a neatness of appearance. Padlocks are principally manufactured at Birmingham, Wolverhampton, Dudley, and in the vicinities of these towns; but the superior kinds, especially those called *Bramah's*, from the name of the inventor, are manufactured in and about London.

PAENSZAJIE, silver money current in Persia, worth two and a half *mamoudis*. The *paenszajie* is equivalent to 1*s.* 4*d.* sterling.

PAGE, one side of the leaf of a book. A folio volume contains 4 pages in every sheet; a quarto, 8 pages; an octavo, 16 pages; a duodecimo, 24 pages; and an octodecimo volume, 36 pages *per* sheet.

PAGODA, or PAGOD, a gold coin, current in several parts of the East Indies: at Madras, the *pagoda* is worth 9*s.*; at Bengal, it is worth 8*s.* 9*d.*; but at Bombay, it is only equivalent to 7*s.* 10½*d.*

PAINT, (GER. *Schminke*. DU. *Blanketzel*, *Blanket*. DA. *Sminke*. SW. *Smink*. FR. *Fard*, *Peinture*. IT. *Belletto*. SP. *Afeite*, *Arrebol*. PORT. *Enfeite*, *Arrebique*, *Rebique*, *Posturas do rosto*. RUS. *Riümanü*. POL. *Barwiczka*, *Rumienidlo*. LAT. *Fucus*.) a term more particularly intended to express those colours which are used in house-painting; the principal article used in the various compositions for which, is white-lead. The grinding is extremely detrimental to health, and for which the following substitute has been proposed by M. De Vaux; viz. two quarts of *sweet* skimmed milk, six ounces and a half of fresh-slaked lime, four ounces of linseed oil, and three pounds of Spanish white to be used in the composition. The lime must be first introduced into a stone vessel, to which should be added such a proportion of milk, as will produce a mixture resembling cream.

The oil is next to be gradually poured in, and the remainder of the milk added. The

Spanish white must next be crumbled in, or scattered on the surface of the fluid, which it gradually imbibes, and at length sinks, when the whole should be briskly agitated.

The quantity above-mentioned is stated to be sufficient for the first coat from twenty-four, to twenty-seven, English yards, and costs in Paris no more than nine sols, or $4\frac{1}{2}d$.

To obtain a *distemper*, or *size-colour*, the paint thus prepared may be tinged with powdered charcoal, yellow ochre, &c. for painting with which the most common oils may be used.

For the modes of preparing various kinds of paint, see COLOURS, and PAINTING.

PAINTERS. There are four sorts of painting, which are properly called trades. 1. House-painting, which is mostly plain work within, or without. 2. Ship-painting, which is also for the most part plain, but, generally, with a great deal of carved work, and gilding. 3. Sign-painting, which is mostly rough figure-work. 4. Coach-painting, which is partly plain, and partly in figures.

Plasterers are not to exercise the trade of a painter in London, without serving^a an apprenticeship. 1 Jac. 1. c. 20. s. 4.

PAINTING is the art of representing all objects of nature visibly, by lines and colours on a plain surface. It has also the power of expressing, by the same means, conceptions and images of the mind, which do not actually exist in any of the usual forms of nature. It is to be considered as an art displaying, either conjointly, or separately, the powers of imagination and imitation: and may be divided into invention, which regards the original thought or conception of the subject; and into composition, design, and colouring, which regard the execution of the work.

Invention consists generally in the choice of such subjects, as are best calculated to answer some great and interesting end; and particularly in discovering, or selecting, such subjects as are capable of being most appropriately expressed by painting, and of producing a powerful effect by such means, as are distinctively placed within the compass of that art.

Composition regards the arrangement of the subject both as to forms, and to the general effects of light and shade, and of colour. It comprehends the general distribution and grouping of the figures, their combination or contrast, the choice of attitudes, the disposal of draperies, the situation of the scene itself, as well as the distribution and connection of all the various parts of scenery and ornament.

Design is used for the first idea of a large work drawn roughly, or in little, with an intention to be executed and finished at large.

Colouring regards, first, the infinite variety

of hues with which nature distinguishes her forms, agreeably to the degree and mixture of the rays of light which their surfaces reflect; and, secondly, the distribution, apposition, and accompaniment of various hues or tints, so as to produce the effect most pleasing to the sight, a circumstance in which nature not always delights. It embraces also the light and shade of objects, as far as by the diminution, or increase, of these harmony of tints before-mentioned can be effected; but that mixed effect of colour, and of light and shade, which is denominated *chiaro-scur*, is more justly regarded as a branch of composition.

Course and methods of study requisite to attain the art of painting.—The knowledge of design is the basis of painting, and its various attainments the necessary steps, by which the painter must commence his advance in the art. The student having completed the various studies which lead to excellence in drawing, must proceed to transfer the principles he has learned to his canvas; and, before he can arrive at eminence, must acquire a complete mastery of the new materials in which he is to display at once the stores of his mind, and the skill of his hand. For this purpose, he must add to the knowledge he already possesses, the study of colours and colouring, in all their branches. It is the knowledge of this department of art which peculiarly characterises the profession he is about to undertake. The various branches of design have formed the commencement of his studies, and he may be supposed a perfect master of them; but these alone cannot constitute him a painter; neither can he acquire that title by the knowledge of every rule of invention or composition. If we consider a painter in regard of these last powers of skill, we rank him with the poet or the draughtsman; if in regard of anatomic knowledge or perspective, we confound him with the anatomist or the mathematician; if in regard of symmetry, grace, and proportions of form, we cannot distinguish him from the geometer or the sculptor. The painter, who is supposed the perfect imitator of nature, necessarily makes colouring his chief object, since he only considers nature as she is imitable; she is only imitable by him as she is visible; and she is only visible as she is coloured.

Although the perfect idea, therefore, of a painter depends on invention, composition, design, and colouring, conjointly, yet it is by the last of these only that he can establish a special idea of his art, since by this we distinguish him from such other artists as have for their object the various powers which can be expressed by design (whose art cannot come up to that perfect imitation of nature, which is within the scope of painting); and by this only we can be decidedly understood to speak of a painter.

To this it is to be added, that as colouring specifically distinguishes the art of the painter from all the other arts of design, so it is the ultimate accomplishment of all his studies in the art of painting.

We shall, therefore, first treat of colouring, and proceed to consider more minutely the component parts which form the art of colouring.

Colouring.—Colouring is that mode of art by which the artist imitates the appearance of colours in all natural objects, and gives to artificial objects those hues which are most calculated to please, or to deceive the sight.

It is the duty of the colourist to consider, that, as there are two sorts of objects, the natural or the real, and the artificial or the painted, so there are also two sorts of colours, viz. the natural, or that which makes all the objects in nature visible to us, and the artificial, or that which, by a judicious mixture of simple colours, imitates those natural ones in all their various situations and circumstances.

The painter must first endeavour to acquire a perfect knowledge of these two sorts of colours; of the natural, in order to distinguish with precision which of them he ought to imitate; and of the artificial, in order to compose the tint most proper for representing the natural colour. He will learn also, that the natural colour is of three sorts: 1st, the true colour of the object; 2d, the reflected colour; 3d, the colour of the light incidental to the object. In the artificial colours, he will distinguish their force and softness separately and by comparison, in order that he may use a proper judgment in heightening or attenuating them, according as his subject may require.

To this end he will also consider, that a picture is, for the most part, a flat superficies; that, some time after the colours are laid on, they necessarily lose their freshness; and that the distance at which a picture is viewed, takes from it much of its brightness and vigour; and it is therefore impossible to guard against these drawbacks on the effect of his pencil, without a complete mastery of that artifice which is the chief object of the art of colouring.

Although imitation is the principal aim of colouring, the painter must by no means be the slave of natural objects, but the judge and judicious imitator of them: he must not imitate all the colours which present themselves indifferently to his eyes; but he must choose the most proper for his purpose, and add or temper with others, to complete the beauty of effect in his work. He must sometimes abate the vivacity of life, and sometimes strive to heighten it, by superior force and brightness of colours, in order to convey to the eye, with precision and truth, the spirit and real character of the object. There are few, and those only among the greatest

painters, who have arrived at the perfect management of this difficult part of the art.

On the apposition of colours, and on the knowledge of *chiaro-scuro*, depends all the harmony of colouring. In what that happy arrangement of colours consists, which produces effects delightful to the eye, no rules can pretend to ascertain. If the source of information in this point is not in the mind of the painter, he will in vain seek for it elsewhere. Improvement, however, may, and must, be superadded to natural discrimination: to acquire the necessary improvement, he will find the best school in the works of those great masters who have possessed the power of colouring in an eminent degree. Such are Titian and Rubens. But he must be careful that, in studying even these great examples of the art, he does not forget that he is only learning from them the road to nature, the final source of his imitation.

Of the few maxims which can be offered on the subject of colouring, the following are the least questionable:

We must learn to view nature to advantage, in order to represent her well. There are two manners of colouring: the one depending on habit, the other on the true knowledge of colours. The first is confined, the second unlimited.

The harmony of nature in her colours arises from objects participating of one another by reflection; for there is no light which does not strike some body; nor is there any enlightened body which does not reflect its light and colour at the same time, in proportion to the force of the light, and according to the nature of the colour. This participation of reflection in light and colour, constitutes that union of colouring which it is the business of the painter to imitate.

This desirable union of colour is sometimes considerably aided in pictures by the process of glazing; that is, by the use of colours which, having little body, are diaphanous; and are, by means of a light brush or pencil, passed over (or, as painters express it, *scumbled over*) such parts of the work as are unpleasantly staring, or otherwise discordant. This use of transparent colour is by some called *toning*, or *tuning*.

Variety of tints, very nearly of the same tone, employed in the same figure, and often upon the same part, with moderation, contribute much to harmony.

The turn of the parts, and the outlines which insensibly melt into their grounds and artfully disappear, bind the objects together, and preserve them in union: as they seem to conduct the eye beyond what it sees, and persuade it that it sees what it really does not see, or at least that it conceives that continuity which the extremities of the objects conceal.

Any loading or overcharging of colouring,

for whatever purpose it is used, must be so discreetly managed as not to destroy the character of the object.

The repetition of the same colour in a picture is to be avoided, unless where it serves to connect the various masses of a composition. The eye becomes tired with viewing the same object; it loves variety artfully presented to it.

The apparent value of colours in a picture (as in all things) arises from comparison.

Several colours which, placed unmixed by one another, have a kind of aerial brightness, when mixed together, produce a disagreeable earthy colour: for instance, ultramarine with fine yellow, or fine vermilion.

Colours which by mixture lose strength and become harmonious, are called broken colours, and contribute as greatly to the sweetness and softness of tones in pictures, as they subtract from their brightness.

Chiaro-scuvo. — The knowledge of lights and shades evidently forms a part of that essential distinction of painting, which we have just described under the head of colouring, and is requisite to that part of colouring which refers to composition. But the incidence of particular lights and shades on bodies placed on certain planes, and exposed to certain lights, (a knowledge to be gained from the study of perspective), is a very small part of that general knowledge of effect which is denominated *chiaro-scuvo*, by which is meant the art of skilfully distributing the lights and shades which ought to appear in a picture, as well for the repose as satisfaction of the eye. The incidence of light may be demonstrated by lines supposed to be drawn from the source of that light to the body enlightened: whereas the *chiaro-scuvo* depends entirely on the painter's imagination, who, as he invents the objects, may dispose them to receive such lights and shades as he proposes for his picture, and introduce such accidents of colour as he deems most advantageous to the effect of the whole.

Chiaro-scuvo, therefore, demands a perfect knowledge of the effects of light and shade, of aerial perspective, of the proportional force of colours, or of those qualities by which they appear to advance to, or recede from, the eye, and of their various degrees of transparency or opaqueness.

The art of *chiaro-scuvo* consists, 1st, in connecting and combining the figures or objects of a composition in such masses of light and of shade, as are both the most pleasing to the eye, and the best calculated for the just development and display of the subject. 2dly, In assigning to each object the colour most corresponding (on account of the force or qualities above-mentioned) to its respective place in the general mass or group, and, at the same time, best harmonizing with the other colours of the picture,

either by its natural and proper tone, or by the reflected hues which it receives from adjoining, or surrounding, objects. The beauty of these reflexes depends on the skilful adaptation of transparent, or opaque, colours. 3dly, In the judicious introduction of such accidents, as contribute to strengthen the general effect and character of the work. It is on *chiaro-scuvo*, says Mengs, that depends the expression of the character of a picture, whether it is gay, or gloomy, cheerful, or solemn.

Composition. — Composition may be divided into the general distribution of objects, the grouping, the choice of attitudes, the contrast, the cast of draperies, and the management of the back-ground, or the connection of the whole effect.

In composition, so far as regards the general distribution of objects, the painter ought to contrive that the spectator may, at the first sight, be struck with the general character of the subject, or at least may comprehend its principal scope. This effect is most readily produced by placing the most essential figures in the most conspicuous places, provided it can be done without violence or impropriety. Besides this distinctness in the general expression of the subject, the beauty of the composition will depend on the variety, connection, and contrast, displayed in the distribution of objects; provided, in like manner, that these are conformable to the nature of the subject, whether gay, familiar, full of motion and hurry, or still, solemn, and melancholy.

The grouping regards both design and *chiaro-scuvo*. In the former, it respects the figures principally concerned in the expression of the subject, which must necessarily be near to, or distant from, one another, as their actions, conversations, or other mutual relations, require. In the latter, it regards those masses which are formed from objects which may be properly arranged together, and those effects of light, and shade, which are formed in consequence of such assemblage or union. These are the points to which the attention must be principally and diligently directed, in forming the groups of a composition.

The choice of attitudes is the principal subordinate division of grouping. Whatever attitude is given, it must not only contribute its due portion to the completion of the group, but the greatest care must be taken by the painter, that it does not appear to be introduced for that purpose merely. It must be appropriate to the character of the individual figure, and expressive of its requisite action; and it must, at the same time, combine whatever beauty of form can be shown by such a selection of turns, or views of the body, as the necessary circumstances will admit. The knowledge of generic characters, under the various modifi-

cations of sex, age, and condition; of the various operations of the passions in the human mind; and a thorough acquaintance with the circumstances of the history or other subjects to be represented; are the best guides to a good choice of attitudes.

The management of the back-ground, or connection of the general effect, is, of all other parts of composition, at once the most difficult to be defined, or performed. It consists in the general accordance and subordination of objects with, and to, one another, so that they shall all concur to constitute but one single object. It is to the whole what the grouping of lines, forms, and chiaro-scuro is to a part. It is effected by a due combination of lights and shades, by an union of colours, and by such oppositions or contrasts as are sufficient to relieve the distinct groups, and to give repose to the eye. Amidst several groups (if the picture consists of such), it requires, that one should be justly predominant in force, and colour, and that all detached objects should be so united with their respective grounds, as to form together one general mass of repose, for the support of the principal object.

The satisfaction of the eye is the ultimate purpose of this difficult part of composition.

Invention. — It now remains to speak of the most arduous attainment of the painter, and which we have placed the last in the order of his studies, because it is that which gives the highest character to the artist, as it affords the greatest opportunities of displaying the powers of his mind.

Invention comprises every kind of subject which can be represented to sight; but it is generally divided into historical, allegorical, and mystical.

Invention simply historical, is the selection of such objects as plainly relate to, or represent, a subject. Its degrees are more, or less, valuable, according to its matter or subject, and its requisite properties are fidelity, and perspicuity. It extends also to the introduction of all such embellishments, as are consistent and congenial with the history represented, in the same manner, as in poetry. The same illustration by collateral erudition, the same enlivening by incidental ornament, the same blending of poetic imagery (not over-stepping truth), is admired in the painter, as in the poet.

Allegorical invention is a choice of objects which serve to represent either wholly, or partly, what they are not; and of which the expression arises from illusion.

Other works are partly allegorical, and partly historical; in which the spectator easily distinguishes the figures purely historical, from others mixed with them in the same picture, and entirely allegorical.

The first great requisite of allegorical painting is, that it be intelligible. An allegory not understood, is a loss of labour, both

to painter, and spectator. For this purpose, it must, in general, consist of such symbols as are established on good authority, or, if new, are obvious to the mind.

In addition to this first requisite, the proper choice of allegory demands, either that the subject could in no other way be represented, or that it could not be represented by historical invention, in an equal degree of force and beauty.

Mystical invention respects the expression of such ideas as are inculcated in our minds by the precepts of religion.

The style of mystical painting is sometimes familiar and tender, as in subjects of the Holy Family, but chiefly majestic and elevated.

OF THE DIFFERENT CLASSES OF PAINTING.

Portraiture. — If the accurate imitation of nature is, on any occasion, capable of forming the principal merit of a picture, it must certainly be in portraiture, which not only represents a man in general, but such a one as may be distinguished from all other men. The greatest perfection of a portrait is extreme likeness, and the greatest fault is the resemblance of a person for whom it was not designed, unless we are inclined to except a still more grievous defect, viz. the want of resemblance to any person whatever. The resemblance of men to one another, is indeed frequently found in living nature, but it is seldom or never so complete and entire, but that some particular turn or view of the face will betray the difference: and it is the business of the artist ever to discriminate, and to appropriate to his pencil those peculiar features, lines, and turns of the face, the representation of which will effectually convey to the spectator the distinct especial idea of the person, whose portrait is set before him.

Various difficulties attend, and not seldom impede, the execution of this task. It is true, that there is not a single person in the world, of whatever age, sex, or condition, who has not a peculiar character, both in body, and face; but it is also the essential duty of portraiture, that it not only imitate what we see in nature, but that it exhibit such views of nature as are confessedly the most advantageous to the person represented. The moment that the idea raised by the sight of the portrait is inferior to that raised by the sight of the person, the labour of the artist sinks into the debasing region of caricature.

Likeness, however, being the essence of portrait, it is unquestionably the part of the painter not to pass over entirely defects, any more than beauties; since, by this means, the resemblance will be more complete. He is only to be aware that he strictly preserves that balance which constitutes the character of the object. It has been sometimes suggested by those who are

more willing to court favour than fame, that all appearances of deformity, when the air, temper, and general likeness of the face, can be discerned without them, ought to be omitted, or corrected, in portraiture; but this must be done at least with considerable discretion; for, by too strenuous endeavours to correct nature, it is always found that the painter insensibly falls into a habit of giving a general air to his portraits, as suitable to one person, as to another, or perhaps properly suited to none.

In the portraits of particularly distinguished characters, of men illustrious either for rank, virtue, great actions, or exalted talents, exactitude of representation, whether in beauties, or defects, cannot be too closely pursued. Portraits of such persons are to become the standing monuments of their high name to posterity; and in this instance every thing is precious that is faithful.

The resemblance, as well as every other excellence, of a portrait, depends on feature, expression, air, colouring, attitude, and attire; and that, not only individually, but viewed collectively.

The features require to be carefully examined and studied by inspection, in many different views, so that at the moment when the painter puts his pencil to the canvas, he may be possessed, not only of the apparent form of each particular feature according to the aspect in which he represents it, but of its real and characteristic form also, the full expression of which is not discernible in every view. Each feature should appear so distinctly shaped, as that an exact model of the real head could be formed from the picture, if requisite; and they must be at the same time so blended in the general mass of the face, that no one shall obtrude itself on the eye beyond the rest. The peculiar mode of touch, or execution, whereby each feature is best discriminated, can only be learned from practice, and the attentive study of the best masters.

It is requisite to observe, that the greatest care is to be used in a portrait, in order that the expression of the features be uniform and consistent with each other. Errors in this respect are among the most frequent in portrait-painting. The mouth is sometimes represented smiling, while the eyes are sad, and *vice versâ*, &c. The painter must therefore constantly bear in mind the general idea that he has formed of the countenance he intends to express, and must be watchful of the corresponding forms of the features, in moments of similar expression. The remark, here applied to the various minute parts of the face, may be extended to all the larger portions of the figure. The same expression must be clearly perceived in the motion or direction of the hands, arms, legs, and body, that appears to prevail in the countenance, and turn of the head. It is this combination only which can give the

exact resemblance of the expression of nature, under the impulse of which no particular limb ever deviates from the general intention of the whole body.

The air principally regards the lines of the face or figure, the attire of the head or person, and the stature or make of the general form.

The proper lines of the face, or figure, depend on accuracy of drawing, and an entire agreement of the parts of the same form with one another. Nothing so entirely disguises or alters the appearance of an individual person, as the change of head-dress, whether it be the adjustment of hair, or attire. The greatest attention, therefore, is to be used in adapting the arrangement of this part of the portrait to the general character of the person represented.

The stature and make, in the same manner, contribute to the force of resemblance (as the least observation on nature will teach us), and never fail considerably to influence the air of the person. It is therefore requisite, for the truth of portrait, that this part of the picture should be as faithfully studied from the sitter, as the face itself.

Nothing varies more quickly, more discernibly, or more frequently, than the colour of a sitter's face. Great care must therefore be taken to establish an uniform judgment of the sitter in this respect also; for the colouring of the skin or complexion, being an effusion of nature, tending to discover the true tempers of persons, exactness of imitation here becomes essential to the exhibition of character. It may be therefore expedient to watch the first moments of the appearance of colour in the sitter, who, sooner or later, from a continuance in one posture, loses those spirits, which at his first sitting down, gave to every part of the face a livelier and fresher hue. There is no other point of painting in which the paradox may be more truly asserted, "that the painter, who only paints what he sees, will never arrive at perfect imitation."

Modes and materials of painting.—The different modes of painting now in use are:

Oil painting; preferable to all other methods, as it admits of a perfect gradation of tints in the most durable of all materials, except those of

Mosaic painting; in which an imitation of objects is produced by the junction of a great number of small pieces of natural marble of different colours fixed in stucco, or mortar, so that if the mortar be well prepared, the monuments of this art may descend to the most remote ages. See MOSAIC-WORK.

Fresco painting; which is performed with colours diluted in water, and laid on a wall newly plastered, with which they incorporate, and are sometimes as durable as the stucco itself.

Crayon painting; in which colours,

either simple or compound, are ground in water mixed with gum, and made into small rolls of a hard paste, which are then used on paper, or parchment.

Miniature painting; which consists of colours prepared with water or gum, and laid on vellum, or ivory. It is of course confined to works of a very small size.

Enamel painting; which is performed on copper, or gold, with mineral colours, dried by fire. This method is also very durable. *See ENAMELLING.*

Wax, or encaustic painting; performed by the mixture of wax with the varnish and colours.

Painting on glass, too well known to need description, and performed by various methods.

Painting in distemper; which is with colours mixed with size, white of eggs, or any thin glutinous substance, and used on paper, linen, silk, board, or wall.

Painting in water-colours, more properly called limning; it is performed with colours mixed with water, gum, size, paste, &c. on paper, silk, and various other materials.

To these is to be added elydoric painting, consisting of a mixed use of oil-colours and water.

Method of painting in fresco.—Before you begin to paint, it is necessary to apply two layers of stucco on the place where your work is to be executed. If you are to paint on a wall of brick, the first layer is easily applied; if of free-stone closely joined, it is necessary to make excavations in the stone, and to drive in nails or pegs of wood, in order to hold the layer together.

The first layer is made of good lime and a cement of pounded brick, or, which is better, river-sand, which latter forms a layer more uneven, and better fitted to attach the second smooth layer to its surface.

Before applying the second layer, on which you are to paint, it is requisite that the first is perfectly dry, as the lime while moist emits a pernicious effluvia.

When the first layer is perfectly dry, wet it again with water, in proportion to its dryness, that the second layer may more easily incorporate with it.

The second layer is composed of lime, slaked in the air, and exposed for a whole year, and of river-sand of an equal grain, and moderately fine. The surface of this second layer must be uniformly even. It is laid on with a trowel; and the workman is provided with a small piece of wood, to remove the large grains of sand, which, if they remained, might render the surface uneven.

To give a fine polish to this surface, a sheet of paper should be applied on it, and the trowel passed and repassed over the paper; this caution will prevent any little inequalities which might injure the effect of the painting at a distance

The workman must not extend the layer over a greater space than the painter is able to finish in a day, as it is necessary that the ground should always be fresh and moist under his pencil; and it is on this account, that the readiness of the artist's hand becomes so requisite a quality in the execution of works in fresco.

The ground being thus prepared, the painter begins his work; but as painting in fresco must be executed rapidly, and as there is not time to retouch any of the strokes of the brush with good effect, he will first have taken care to provide himself with large finished drawings in chalk, or paintings in distemper, of the same size as the work which he has to paint, so that he shall have only to copy these drawings on the wall.

These drawings are generally made on large sheets of paper pasted together, and have thence been generally termed cartoons (*cartoni*.)

The painter traces the outlines of the figures on the plaister, by passing a steel point over them, or pricking them closely, and passing very finely powdered charcoal through the pricked holes. He then proceeds to the completion of his work, having his chief tints ready prepared in separate earthen pots, and generally first trying their effect on a dry smooth tile, which quickly imbibing their moisture discovers the hue which they will have when dry on the wall.

All natural earths are good for painting in fresco. The colours are ground and tempered with water. It is to be remarked, that all the colours used in this method of painting brighten as they grow dry, excepting the red varnish, the brownish red ochre, ruth-ochre, and the blacks, particularly those that are passed through the fire.

The best colours are white, made of old lime, and white marble-dust (the proportional quantity of the latter depends on the quality of the lime, and must be found by trial, as too great a quantity of marble-dust will turn the colour black;) ultramarine-blue, the black of charcoal, yellow ochre, burnt vitriol, red earth, green of Verona, Venetian black, and burnt ochre.

Other colours, which require to be used with great precaution, are amel, or enamel-blue, and cinnabar. Enamel-blue must be applied instantaneously, and while the lime is very moist, otherwise it will not incorporate; and if you retouch with it, you must do it an hour, or more, after the first application of it, in order to increase its lustre.

Cinnabar has a splendour almost beyond all other colours, but it loses it when mixed with lime. It may, however, be employed in places not exposed to the air, if proper care be used in preparing it. For this purpose, reduce a quantity of the purest cinnabar to powder, put it into an earthen vessel, and pour lime-water on it two, or three,

times. By this process the cinnabar receives some impression from the lime-water, and you may then use it with greater safety.

The white of lime is formed by mixing lime, slaked a long time before, with good water. The lime deposits a sediment at the bottom of the vessel; when the water is poured off, this sediment is the white of lime.

Another kind of white may likewise be made from egg-shells, pounded, in great quantities, and boiled in water, together with quick-lime, and afterwards put into a strainer and washed repeatedly with spring water.

The shells must be again pounded until the water employed for that purpose becomes pure and limpid; and when the shells are completely reduced to powder, they are ground in water, made up in small pieces, and dried in the sun.

The effect of this colour must be ascertained by experiment.

Ochres of all kinds make good colours for fresco, being previously burnt in iron boxes.

Naples yellow is dangerous to be used, when the painting is much exposed to the air.

Blacks, from charcoal, peach-stones, and vine-twigs, are good; that extracted from bones, has been said to be of no value for this purpose.

There is another black used by the Italians, which they called *fescia da botta*. It is made of the lees of burnt wine.

Roman vitriol gathered at the furnaces, and called burnt vitriol, being afterwards ground in spirits of wine, resists the air extremely well. There is also a red extract from this preparation, somewhat like that of lac. This colour is a good preparatory for the layers where cinnabar is afterwards to be used; draperies painted with these two colours are as bright as fine lac used with oil.

Ultramarine never changes, and seems to communicate its permanent quality to the colours with which it is mixed.

Distemper.—All colours are proper for distemper, except the white of lime, which is used in fresco only.

Azure and ultramarine must be used with a paste made of glove-skin, or parchment, as they will turn green when mixed with yolks of eggs.

If the work be on walls, care must be taken that they are quite dry. The painter must even lay on two layers of hot paste before he applies the colours, which, if he pleases, he may also temper with paste, the composition of eggs and fig-tree branches being only for retouching, and the paste rendering the work more durable. When used, it must be kept hot by fire. This paste, as has been said, is made of glove-skin or parchment.

All their designs for tapestry were made

on paper, in the same manner as has been mentioned in the account of the cartoons used for fresco-painting.

When a painter in distemper would work on cloth, he must choose that which is very old and smooth; then press pounded plaister with glove-skin paste, and lay it over the cloth; when dry, add another layer of the same paste.

All the colours are pounded with water, and as the painter wants them for his work, he tempers each with paste-water; or if he will only make use of yolks of eggs, he takes of water one glass, to which he adds an equal quantity of vinegar, the yolk, white, and shell of an egg, and some ends of fig-tree branches cut into small pieces, and beats them all well together in an earthen pan.

If he wishes to varnish his picture when finished, he must rub it with the white of an egg well beaten, and then put on a single coat of varnish.

Oil-painting.—The principal advantage of oil-painting over other methods consists in the colours drying less speedily, so that it allows the painter to finish, smooth, and retouch his works with greater care and precision. The colours also being more blended together, produce more agreeable gradations, and a more delicate effect.

As the superior beauty of oil-painting depends on the vividness, and delicacy, of durable tints, we shall present the student with the best rules drawn from a careful study of the works of Vandyck, and Rembrandt, two of the most remarkable colourists in different styles. These rules are arranged in so easy a method, that the student may be led, step by step, through all the difficulties of this nice and pleasing progress.

We shall first treat of the painting of flesh, next of draperies, then of the back ground, and lastly of landscapes.

OF PAINTING FLESH.

Principal colours from which all the tints of the flesh are made, and their qualities in painting.—Flake-white is the best white known to us. This colour should be ground with the finest poppy-oil that can be produced. It is often found to turn yellow, on account of the oil, generally sold by that name, not being really drawn from poppies.

White comes forward to the eye with yellows and reds, but retires with blues and greens. It is the nature of all whites to sink into whatever ground they are laid on, therefore they should be laid on white grounds.

Ivory-black is the best black: it is a colour which mixes kindly with all the others. It is the true shade for blue; and when mixed with a little Indian red, it is the best general shadow-colour that can be used. It is generally ground with linseed-oil, and used with drying-oil.

Black is a cold retiring colour.

Ultramarine is the finest blue in the world: it is a tender retiring colour, and never glazes, and is a beautiful glazing colour. It is used with poppy-oil.

Prussian blue is a very fine blue, and a kind-working colour: it is ground with linseed-oil, though nut-oil is more proper. It should never be used in the flesh, but in green tints, and the eyes.

Light ochre is a good mixing colour, and of great use in the flesh; it is usually ground with linseed-oil, but nut-oil is better. All yellows are strengthened with red, and weakened with blues and greens.

Light red is nothing but fine light ochre burnt. This and white, in mixing, produce a most perfect flesh-colour. It is a beautiful clean colour; but too strong for the white, and therefore will grow darker. It should be ground, and used with nut-oil.

No vermilion, but what is made of the true native cinnabar, should be used. It will not glaze; but is a fine colour when it is glazed. It is ground with linseed-oil, and should be used with drying-oil.

Carmine is the most beautiful crimson: it is a middle colour, between lake and vermilion; is a fine working colour, and glazes well. It should be ground with nut-oil, and used with drying-oil.

Lake is a tender deep red, but of no strong body; therefore it should be strengthened with Indian red. It is the best glazing colour that can be used. It is ground with linseed-oil, and used with drying-oil.

Indian red is a strong pleasant working colour, but will not glaze well; and when mixed with white, falls a little into lead: it is ground and used as the lake.

Brown pink is a fine glazing colour, but of no strong body. In the flesh it should never join or mix with the lights, because this colour, and white, antipathize, and mix of a warm dirty hue: for which reason their joinings should be blended with a cool middle tint. In glazing of shadows it should be laid before the other colours that are to enrich it; it is one of the finishing colours, and therefore should never be used in the first painting. It is strengthened with burnt umber, and weakened with terraverte; ground with linseed-oil, and used with drying-oil.

Burnt umber is a fine warm brown, and a good working strong colour: it is of great use in the hair, and mixes finely with the warm shade.

Principal tints, composed from the foregoing principal colours, and necessary for painting flesh. — Light red tint is made of light red, and white: it is the best conditioned of all colours, for the general ground of the flesh. With this colour and the shade-tint, you should make out all the flesh, like *claro-obscuro*, or *mezzotinto*. Remember, that this colour will grow darker, because it

is in its nature too strong for the white; therefore you should improve it, by mixing vermilion, and white, with it, in proportion to the fairness of the complexion.

Vermilion tint is only vermilion, and white, mixed to a middle tint; it is the most brilliant light red that can be. It agrees best with the white, light red, and yellow tints.

Carmine tint is carmine and white only, mixed to a middle tint; it is, of all colours, the most beautiful red for the cheeks and lips; it is one of the finishing colours, and should never be used in the first painting, but laid upon the finishing colours without mixing.

Rose tint is made of the red shade, and white, mixed to a middle degree, or lighter; it is one of the cleanest and most delicate tints that can be used in the flesh, for clearing up the heavy dirty colours, and, in changing, will sympathise and mix kindly.

Yellow tint is often made of Naples yellow and white; but it is as well to use light ochre and white, which is a good working colour. The ochre is too strong for the white; therefore you should make a little allowance in using it. It follows, that the light red tints, and yellows, should always be laid before the blues. If you lay too much of it, you may recover the ground it was laid on with the light red tints.

Blue tint is made of ultramarine and white, mixed to a lightish azure; it is a pleasant-working colour; with it you should blend the gradations. It follows the yellows, and with them it makes the greens; and with the reds it produces the purples. No colour is so proper for blending down, or softening the lights into keeping.

Lead tint is made of ivory-black, and fine white, mixed to a middle degree; it is a retiring colour, and therefore is of great use in the gradations, and in the eyes.

Green tint is made of Prussian blue, light ochre, and white. This colour will dirty the lights, and should be laid sparingly in the middle tints. It is of most use in the red shadows, where they are too strong.

Shade tint is made of lake, Indian red, black, and white, mixed to a beautiful murrey colour, of a middle tint. This is the best mixture for the general ground of shadows. It mixes well with the lights, and produces a pleasant clean colour, a little inclined to the reddish-pearl. As all the four colours of its composition are of a friendly sympathising nature, so consequently this will be the same, and therefore may be easily changed by the addition of any other colours.

Red shade is nothing but lake, and a very little Indian red. It is an excellent working colour, and a good glazer; it strengthens the shadows on the shade-tint, and receives, when it is wet, the green, and blue, tints agreeably. It is a good ground for all dark shadows.

Warm shade is made of lake, and brown

pink, mixed to a middle degree. It is a fine colour for strengthening the shadows on the shade-tint, when they are wet, or dry. Take care that it does not touch the lights, because they mix of a dirty colour, and therefore should be softened off with a tender cold tint.

Dark shade is made of ivory-black, and a little Indian red only. This colour mixes very kindly with the red shade, and blends agreeably with the middle tints in the dead colouring. It is excellent for glazing the eyebrows, and the darkest shadows.

Process. — The process of oil-painting, particularly in the colouring of flesh and in landscape, is to be divided into three stages, or paintings.

The colours and tints necessary for the first, and second, stages of painting flesh, are; 1. flake, or fine white; 2. light ochre and its tints; 3. light red and its two tints; 4. vermillion and its tint; 5. a tint composed of lake, vermillion, and white; 6. rose tint; 7. blue tint; 8. lead tint; 9. green tint; 10. half-shade tint, made of Indian red and white; 11. shade tint; 12. red shades; 13. warm shade.

The finishing pallet for a complexion requires five more, viz. 1. carmine and its tint; 2. lake; 3. brown pink; 4. ivory-black; 5. Prussian blue.

First stage, or dead-colouring of flesh. — The first lay of colours consists of two parts; the one is the work of the shadows only, and the other that of the lights.

The work of the shadows is, to make out all the drawing very correctly with the shade tint, in the same manner as if it was to be done with this colour only; remembering to drive or lay the colour sparingly. The lights should be all laid in with the light red tint, in different degrees, as we see them in nature. These two colours united, produce a clean, tender, middle tint. In uniting the light, and shades, you should use a long softener, about the size of a large swan-quill, which will help to bring the work into character, and leave the colouring more delicate; then go over the darkest shadows with the red or warm shade, which will finish the first lay.

The warm shade being laid on the shade tint, improves it to a warmer hue; but if laid instead of the shade tints, it will dirty and spoil the colours it mixes with; and if the red shade be laid first, instead of the shade tint, the shadows would then appear too red; therefore, notwithstanding these two colours are the best for the shadows, yet they are too strong to be laid alone, which is a proof of the great use and merit of the shade tint. Here we may observe, that the shade, and light red, tints are so friendly in their nature, that even in continually altering and changing, they always produce a clean colour of a pearly hue.

Next. — In order to finish the first paint-

ing, improve the reds and yellows to the complexion, and after them the blues; observing, that the blues and the reds make the purple, and on the yellows produce the green. The same method is to be understood of the shadows; but be sure to leave them clean, and not too dark; therefore allowance should be made in the grounds with the light red, because glazing them will make them darker. When the cloth is of a dark or bad colour, there must be a strong body of colour laid all over the shadows, such as will not sink into the ground, but appear warm, and a little lighter than the life, so that it may be of the same forwardness to finish, as if it had been a light ground; therefore the business of dead-colouring is, that you leave it always in the same order for finishing, though the colour of the cloth be quite the reverse.

The grounds of shadows, in what we call the dead-colouring, should be such as will support the character of the finishing colours; which ground must be clean, and a little lighter than the finishing colours, because the finishing of the shadows is glazing; and no other method than glazing can leave such brilliancy and beauty as they ought to have. If you begin the first painting with glazing, it will stare, and be of no use; and the solid colours which are laid on it, will look heavy and dull; therefore, all shadows and colours that are to be glazed, should be done with colours of a clean solid body, because the glazing is more lasting, and has the best effect, on such colours. Remember to leave no roughness, that is, none such as will appear rough, and interrupt or hurt the character of the finishing colours; which, by examining the work while it is wet with a soft tool, or when it is dry with a knife, may be avoided, as it will easily take off the knots and roughest parts.

The light red and white improved is superior to all other colours for the first lay or ground; which should be always done with a full pencil of a stiff colour, made brighter than the light, because it will sink a little in drying. The greater the body, and quantity of colour, and the stiffer it is laid, the less it will sink. Every colour in drying will sink, and partake, in proportion to its body, of the colour it is laid on; therefore, all the lights of the flesh, if not laid on a light ground, must consequently change a little from the life, if there be not allowance made. The shade tint for the shadows should fall into the rose-tint, as the complexion grows delicate; all which should be lightly united, with a soft long pointed hog-tool, to the lights, making out the whole like mezzotinto.

Second painting, or second stage. — The second painting begins with laying on the least quantity, that can be, of poppy-oil; then wipe it almost all off, with a dry piece of a silk handkerchief.

The second painting is also divided into two parts: one, the first lay of the second painting; which is scumbling the lights, and glazing the shadows; the other, finishing the complexion with the virgin tints, and improving, as far as you can, without daubing.

First. — Scumbling is going over the lights, where they are to be change, with the light red tints, or some other of their own colours, such as will always clear and improve the complexion, with short stiff pencils; but such parts only as require it, otherwise the beauty of the first painting will be spoiled.

The light red tint improved is the best colour for scumbling, and improving the complexion in general. Where the shadows and drawing are to be corrected, you should do it with the shade tint, by driving the colour very stiff and bare, that you may the easier retouch, and change, it with the finishing tints. Some parts of the shadows should be glazed with some of the transparent shadow-colours, such as will improve it, and come very near to the life; but be sure not to lay on too much of it, for fear of losing the hue of the first painting, the ground of which should always appear through the glazing. Be very careful in uniting the lights, and shades, that they do not mix dead and mealy; for the more the lights mix with the shades, the more mealy those shades will appear. Thus far the complexion is prepared and improved, in order to receive the virgin tints.

Second. — Go over the complexion with the virgin tints. These are the colours which improve the colouring to the greatest perfection, both in the lights, and shadows.

This should be done in the same manner as you laid them in the second part of the first painting; that is, with the reds, yellows, and blues, blending them with delicate light touches of the tender middle tints, without softening. Leave the tints, and their grounds, clean and distinct, and be content to leave off whilst the work is safe and unsullied, postponing what is farther required for the next sitting; for, in attempting the finishing touches before the other is dry, you will lose the spirit and drawing, and your colours will become of a dirty hue.

Third painting, or finishing. — It is to be supposed, the complexion now wants very little more than a few light touches; therefore there will be no occasion for colouring.

Begin with correcting all the glazing; first, where the glazing serves as a ground or under part; then determine what should be done next, before you do it, so that you may be able to make the alteration on the part with one stroke of the pencil. By this method you preserve both the glazing, and the tints; but if it happens that you cannot lay such a variety of tints and finishing colours as you intended, it is much better to leave

off while the work is safe and in good order; because those few touches, which would endanger the beauty of the colouring, may easily be done, if you have patience to stay till the colours are dry; and then, without oiling, add those finishings with free light strokes of the pencil.

It is much easier to soften the over-strong tints when they are dry, than when they are wet; because you may add the very colours that are wanting, without endangering the dry work. If any of the colours of the pallet want to be a little changed to the life, when you are painting, it is much better to do it with the knife on the pallet than with the pencil, because the knife will mix and leave it in good order for the pencil.

Of painting draperies.

In order to show the nature, and different degrees, of colours of tints used in painting draperies, we must first determine how many divisions are absolutely necessary to make the first lay of colours, and after that the reflections and finishing tints.

The right method of painting draperies in general is to make out the whole, or the first lay, with three colours only, viz. the lights, middle tint, and shade tint.

Observe that the lights should rather incline to a warmish hue; and the middle tint should be made of friendly-working colours, such as will always mix of a clean, tender, coldish hue. The shade tint should be made of the same colours as the middle tint, only with less light; therefore this tint will also mix of a tender clean colour. The beauty and character of the folds, the shade, attitude, and principal lights, and shades, are all to be considered, and made with these three colours only; which should be done to your satisfaction, before you add any of the reflects, or finishing tints.

The reflections of draperies and satins are generally productions of their own, and are always lighter than the shadows on which they are found; and being produced by light, will consequently have a light warm colour, mixed with the local colour that receives them. Here it will be necessary to notice the general method of managing the colours of the first lay, and those of the reflections, and finishing tints.

In the first lay, the high lights should be laid with plenty of stiff colours, and then shaped and softened into character with the middle tint very correctly. Where the gradations of the lights are slow, as in the large parts, it will be proper to lay the middle tint first at their extremities, with a tool that will drive the colour, and leave it sparingly; because the lights will mix and lie the better upon it. Next, make out all the parts of the shadows with the tint driven bare. After this comes the middle tint, for the several lights, and gradations; which should be very nicely wrought up to character

without touching any of the high lights which finish the first lay.

The reflects, and finishing tints, are, in general, the antipathies of the first lays: they will, without great care, dirty the colours on which they are laid; and therefore should be laid with a delicate light touch, without softening. If it be overdone, endeavour to recover it with the colour of the part on which it was laid; this may be done directly, or when it is dry. Whether the reflects proceed from the same colour, or any other, the method of using them is the same.

But before we proceed to the particular colours, it will be proper to make some observations on their grounds.

It often happens, that the colour of the cloth is very improper for the ground of the drapery; and when it is so, you should change it with those colours which are most proper to improve and support the finishing colours. This method of dead-colouring must consequently preserve them in the greatest lustre. In dead-colouring, you should lay the lights, and shades, in a manner so as only to show a faint idea of them, with regard to the shape and roundings of the figure. If you have a design to work from, then it will be proper to make all the large and principal parts in their places: which should always be done with a colour that is clean, and lighter than the intended drapery, though, in general, of the same hue; and let the shadows be no darker than a middle tint. These should be mixed and broke in a tender manner, and then softened with a large tool, so that nothing rough and uneven is left to interrupt or hurt the character of the finishing colours.

White satin.—All whites should be painted on white grounds, laid with a good body of colour, because this colour sinks more into the ground than any other.

There are four degrees of colours in the first lay to white satin. The first is the fine white for the lights; the second is the first tint, which is made of fine white and a little ivory-black, mixed to an exact middle degree between the white, and the middle tint. This colour follows the white; and it is with this you should shape the lights into character, before you lay on any other; and take care that this first tint appear distinctly between the white, and the middle tint, otherwise the beauty and the character of the satin will be spoiled.

The middle tint should be made of white, black, and a little Indian red. These three colours are very friendly, and mix to a beautiful clear colour of a pearly hue, which has the true brightness and warmth of the general hue of the satin. Remember to allow for the red hue changing a little to the lead. If there be occasion to make any part in the middle tint lighter, do it with the first tint only. This colour should also be laid sparingly before the white, in all the little

lights that happen in the middle tints, and shadows; on which you should lay the white with one light touch, and be sure not to cover all the parts that were made with the first tint; if you do, it will spoil the character, and look like a spot, for want of the softening edge or border, which must be between the white, and the middle tint. The shade tint should be made of the same colour as the middle tint, but with less white, so that it is dark enough for the shadows in general; with which make out all the parts of the shadows nicely to character, which is the work of the first lay.

Next follow the reflects, and finishing tints.

Brown ochre, mixed with the colour of the light, is the most useful colour in general for all reflects in draperies, that are produced from their own colours. All accidental reflexes are made with the colour of the parts from which they are produced, and the local colours that receive them. There are but two reflecting tints wanted for draperies in general; one should be lighter than the middle tint, the other darker. These colours may be a little changed on the pallet with the first, and middle, tints, as occasion requires, or lightly broken on the part that receives them; but this last method is not so safe as the other. The tint sufficient for blending the dark shadows to the mellow tender hue, is made with the shade tint, and a little brown ochre, which should be laid on very sparingly, with soft light touches, for fear of making them dull and heavy; if it is overdone, recover it with the colour it was laid upon.

We often see a little blue used in the first tint of white satin.

Blue satins.—Blue satin is made of Prussian blue, and fine white.

The best ground for blue is, white for the lights, and black and white for the shadows.

The first lay of colours for blue is divided into three degrees or tints. First make the middle tint of a beautiful azure; then mix the colour for the light about a middle degree, between that and white. Make the shade tint dark enough for the shadows in general. All the broad lights should be laid with plenty of colour, and shaped to character with the middle tint, before you lay on any other colours. Remember, the less colours are mixed, the better they will appear and stand; for the lights of blue, should be managed with as much care as those of white, satin. Next follow with the rest of the middle tint, and then make out all the shadows. The more you drive the shade tint, the better it will receive the reflects, and finishing tints. The shadows should be strengthened and blended with ivory-black, and some of their own colour, which will mix with them into a tender mellow hue.

The reflects are made as those of white satin, that is, with ochre, and some of the

lights; which should be perfectly done, as you intend them, at once painting. The shadows, when dry, may be a little improved, if there be occasion to alter them, with the colours they were made with. The Prussian proper to be used, is that which looks of the most beautiful azure before it is ground; and the sooner it is used after it is ground, the better it will work, and appear.

Velvet may be painted at once. The method is, to make out the first lay with the middle tint, and shade tint; on which lay the high lights, with light touches, and finish the shadows in the same manner as those of satin; but the nearest imitation of velvet is done by glazing; the method of which is, to prepare a ground, or dead-colouring, with such colours as will, when dry, bear out, and support, the glazing colour in its highest perfection. The nature of the glazing colour is to be of a fine transparent quality, and used simply with oil only, so that whatever ground it be laid on, the whole may appear distinctly through it. The best ground for blue is made with white, and ivory-black: the white is for the high lights, which, with the middle tint, and shade tint, makes out the first lay like mezzotinto. Remember to make the middle tint lighter in proportion to the glazing, because that will make it darker. It is often necessary to cover all but the high lights, with a thin glazing, laid in less quantity, than if it were to be done once only. If any of it touch the lights, wipe it off with a clean rag. The very high lights should be improved, and made of a fine white, and left to dry. The glazing colour is Prussian, ground very fine with nut-oil; and should be laid with a large stiffish tool. It is on the last glazing we should strengthen, and finish, the shadows.

The greatest fault in the colouring of draperies is the painting the shadows with strong glaring colours, which destroy the beauty of the lights. This is not only the reverse of art, but of nature, whose beauty always diminishes in proportion with the lights. For this reason, take care to blend and soften the shadows with such friendly colours, as will agree with their local character and obscurity. Here observe, that glazing the middle tint, which is made of black and white, will not produce a colour so blue, as if it had been prepared with Prussian, and white; yet this colour will preserve the beauty of the lights in the highest perfection, by reason of its tender obscure hue, when the blueness of the other would only diminish them. This method of glazing the blue is the general rule for all glazing.

When glazing blue, the lights may be glazed with ultramarine, though all the other parts are done with Prussian. This method saves a great quantity of that valuable colour, and answers the purpose as well as if it had been done with ultramarine.

Though this general method of painting satins is to make the first lay of colours with three degrees, or tints, yet you should understand, in using them, that they produce two more; for the mixing of two different colours together on the cloth will make another of a middle tint between them; so it is with the lights, and middle tints, and with the middle tint, and shade tint: the first answers to the first tint in white satin, and the last will consequently be a sort of gradating, or half-shade.

If the lights and middle tint mix to a beautiful clean colour, of a middle hue between both, there will be no occasion for a colour to go between them, as in blue satin: but if, in mixing, they produce a tint inclined to a dirty warm hue, then another of a sympathising nature should be laid between them, in order to preserve the beauty of the lights, as the first tint in the white satin; for if it were not so, the red in the middle tint would certainly dirty and spoil the white.

It is highly necessary to understand these principles of the first lay of colours, in order to have a perfect knowledge of the general rule of colouring.

Scarlet and crimson. — A light yellow red, made of light ochre, light red, and white, is the proper ground for scarlet; the shadows are Indian red, and in the darkest parts mixed with a very light black.

The second painting should be a little lighter than you intend the finishing colour, that is, in proportion to the glazing, which will make it darker.

The high lights are vermilion, and white, for satin, and velvet, and vermilion for cloth. The middle tint is vermilion, with a very little lake, or Indian red; the shade tint is made with Indian red, and lake, with the addition of a little black in the darkest shadows. The difference between scarlet, and crimson, is, that the high lights of crimson are whiter, and the middle tint is made darker. Their reflects are made with light red, and vermilion. The high light should be laid and managed in the same manner as those of the blue, for fear of dirtying them; and sometimes they require to be touched over the second time before we glaze them. The more the colours of the second painting are driven, the easier and better they may be managed to character; but the high lights should have a good body of colour, and be left with a delicate light touch. After it is well dry, finish with glazing the whole with fine lake, and improve the reflects and shadows. Remember that the scarlet requires but a very thin glazing; and it is better to glaze the crimson twice over, than lay too much at once painting.

Pink-colour. — There are two different methods of painting a pink colour; one is by glazing, the other is done with a body of colours at one painting. The same grounds

do for both: which should be a whitish colour, inclining to a yellow, for the lights: and Indian red, lake, and white, for the shadows.

The second painting for the glazing method, is done with the same colours, and a little vermilion, and white, for the high lights. When it is dry, glaze it with fine lake, and then break and soften the colours into harmony directly.

The other method is to make the high lights with carmine, and white; the middle tint with lake, white, and a little carmine; and the shadows with lake, and Indian red, with a little vermilion for the reflections. But remember, the shadows will require to be broken with some tender obscure tint.

Yellow. — The ground for yellow should be a yellowish white for the lights, and a mixture of the ochres for the shadows.

There are the same number of tints in the yellow, as there are in the white satin, and the method of using them is the very same. The lights are made with king's yellow, ground with clean good drying oil. The first tint is light ochre, changed with a little of the pearl tint made with the dark shade, and white, which should be laid and managed as the first tint in white satin. The middle tint is a mixture of the light, and brown ochre, softened with the pearl tint. The shade tint is made with brown pink, and brown ochre; these belong to the first lay.

The reflects are light ochre, and sometimes in the warmest parts mixed with a little light red. The shadows are strengthened with brown pink, and burnt umber.

Green. — The proper ground for green is a light yellow green, which is made of light ochre, a little white, and Prussian blue, for the lights, and the ochre, brown pink, and Prussian, for the shadows.

The finest green for draperies is made of king's yellow, Prussian blue, and brown pink. The high lights are king's yellow, and a very little Prussian; the middle tint should have more Prussian; and the shadow tint is made with some of the middle tint, brown pink, and more Prussian; but the darkest shadows are brown pink and a little Prussian. The lights, and middle tint, should be managed in the same manner, as those of the blues. The shadow tint should be kept entirely from the lights, because the brown tint that is in it will, in mixing, dirty them, as the black does those of the blue. Remember to allow for their drying a little darker; and that the king's yellow must be ground with good drying oil; for the longer it is drying, the more it will change and grow darker; and the sooner it is used, the better it will stand. It is proper to have two sorts of king's yellow, one to be very light, for the high lights of velvet.

Changeable colours. — Changeable colours are made with four principal tints; viz. the

the high lights, middle tint, shade tint, and reflecting tint.

The greatest art lies in finding the exact colour of the middle tint, because it has more of the general hue of the silk than any of the others. The shade tint is of the same hue with the middle tint, though it is dark enough for the shadows. The high tints, though often very different from the middle tint, should be of friendly-working colour, that will, in mixing with it, produce a tint of a clean hue.

The method of painting silks is to make out the folds with the shade tint, and then fill them up in the lights with the middle tint. This first lay should be done to your satisfaction before you add any other colours; and the stiffer the middle tint is used, the better the high lights may be laid upon it. The reflecting tint falls generally upon the gradating half-shades, and should be laid with tender touches sparingly, lest it spoil the first lay.

This method of painting answers for all coloured silks, as well as changeable, with this difference only; that the plain colours require not so much art in matching the tints, as the changeable. The last part of the work is the finishing and strengthening the shadows with an obscure tint, a little inclining to a mellowish hue; such as will not catch the eye, and interrupt the beauty of the lights.

Black. — The best ground for black is light red for the lights, and Indian red, and a little black, for the shadows.

The finishing colours are, for the lights, black, white, and a little lake. The middle tint has less white, and more lake and black; the shade tint is made of an equal quantity of lake and brown pink, with a very little black.

The method of painting black is very different from that of other colours; for as in these the principal thing is to leave their lights clear and brilliant; so in black, it is to keep the shadows clear and transparent. Therefore begin with the shade tint, and glaze over all the shadows with it. Next lay in the darkest shadows with black, and a little of the shade tint, very correctly. After that, fill up the whole breadth of lights with the middle tint only. All which should be done exactly to the character of the satin velvet, cloth, &c. &c. and then finish with the high lights.

Here observe, the ground being red, will bear out and support the reds, which are used in the finishing colours. The lake in the lights takes off the cold hue, and gives it a more beautiful colour. If the shade tint was of any other colour than a transparent warm hue, the shadows would consequently be black and heavy; because no other colours can preserve the warm brilliancy which is wanting in the shadows of the black, like lake, and brown pink. Black is of a cold heavy nature, and always too

strong for any other colour; therefore you should make an allowance in using it. There will be a few reflects in satin, which should be added as those of other colours; but they should be made of strong colours, such as burnt umber, or brown ochre, mixed with a little shade tint.

Though the grounds mentioned for the draperies are absolutely necessary for the principal, and nearest, figures in a picture, such as a single portrait or the like; yet for figures which are placed behind the principal, or front, figures, their grounds should always be fainter in proportion to their local finishing colours.

Linen. — The colours used in linen are the same as those in white satin, except the first tint, which is made of white, and ultramarine ashes, instead of the black, and mixed to a very light bluish tint.

In the dead-colouring, take particular care that the grounds are laid very white, and broad, in the lights. The shadows are made with black, white, and a little Indian red, like the middle tint of white satin. These should be left very light and clean, in order to support the finishing colours.

The second painting begins with glazing all the lights, with a stiff pencil, and fine white only, driven bare, without using any oil. The shadows may be scumbled with poppy-oil, and some of the colour they were made of. This is the first lay, on which you are to follow with the finishing colours directly. The middle tint of white satin is the best colour for the general hue of the shadows. With this and white, in different degrees, make out all the parts to character, with free light touches, without softening; then, with a large long-pointed pencil, and fine white, lay the high lights very nicely with one stroke. After this comes the fine light bluish tint, which should be mixed light, and laid in the tender gradations, very sparingly and lightly without filling them up.

Remember, the first lay should be left clear and distinct; the more it appears, the better. It is the overmixing and joining all the colours together, which spoils the beauty of the character; therefore it is better to let it dry before we add the reflects, and finishing tints.

The method of letting the beautiful clear colour dry, before you add the warm reflects, and harmonizing tints, prevents them from mixing, and dirting each other.

The principal blending colours used in the reflects are the yellow tint, green tint, and rose tint; which last is made of lake, Indian red, and white. Glazing the pearl, and lead-colour, with white, though it seems to answer our purpose at the time when it is done, will certainly sink, and be lost in the grounds on which it is laid; therefore you should make the dead-colouring as white as you intend the finishing colours, by reason they will sink a little in proportion

to the colour of the cloth, which the glazing with pure white only will recover.

OF PAINTING BACK GROUNDS.

The principal colours that are necessary for painting of back-grounds, as walls, buildings, or the like, are white, black, Indian red, light and brown ochre, Prussian, and burnt umber; from which the eight principal tints are made, as follows:

1. Pearl is made of black, white, and a little Indian red.
2. Lead, of black and white, mixed to a dark lead-colour.
3. Yellow, of a brown ochre and white.
4. Olive, of light ochre, Prussian, and white.
5. Flesh, of Indian red and white, mixed to a middle tint.
6. Murrey, of Indian red, white, and a little black, mixed to a kind of purple, of a middle tint.
7. Stone, of white, umber, black, and Indian red.
8. Dark shade, of black, and Indian red, only.

Here the lead tint serves for the blues, the flesh tint mixes agreeably with the lead, and the murrey is a very good blending colour, and of a great use where the olive is too strong; the umber, white, and dark shade, will produce a fine variety of stone colours; the dark shade and umber, used plentifully with drying oil, make an excellent warm shadow-colour. All the colours should be laid with drying oil only, because they mix and set the better with the softener.

Where the marks of the trowel are so strong in the priming of the cloth, that one body of colours will not be sufficient to conceal it, lay a colour to prevent it, which should be dry, before you begin with those parts you expect to finish at once painting.

Process. — The process of painting back-ground is divided into two parts, in stages; the first is the work of the first lay, the second that of the finishing tints.

Begin the first lay from the shadowed side of the head, and paint the lights first; from them go into the gradations and shadows, which should be done with a stiffish tool, very sparingly, with the dark shade and white, a little changed with the colours that will give it more of the required hue, but very near, in regard to tone and strength, leaving them like mezzotinto.

The dark, and warm, shadows should be laid before the colours that join them. This do with the dark shade and umber, driven with drying oil. If those colours were laid on first, they would spoil the transparency, which is their greatest beauty. The more the first lay is driven, the easier and better you may change it with the finishing tints, therefore you may lay them with the greater body.

The second part is to follow directly,

whilst the first lay is wet, with those tints that are the most proper to harmonise and finish with.

Begin with the lights first, and remember, as you heighten and finish them, to do it with warmer colours; and let those be accompanied with fine tender cold tints. The lightest parts of the ground should be painted with a variety of light, warm, clear colours, which vanish and lose their strength imperceptibly in their gradations. Take care that you do not cover too much of the first lay, but consider it as the principal colour.

From the lights, go to the gradations and shadows; for when the lights are well adapted to produce and support the figure, it is easy to fall from them, into whatever kind of shadows you find most proper; then soften and blend the whole with a long large hog-tool; which, with the strength and body of the drying oil, will melt and sweeten altogether, in such a manner, as will seem surprisingly finished. Remember the tints will sink, and lose a little of their strength and beauty in drying. All grounds, as walls, &c. should be finished at once painting; but if they want to be changed, glaze them with a little of the dark shade and drying oil, driven very bare; on which, with a few light touches of the colour that is wanting, you may improve their hue. The dark shadows may also be strengthened and improved by glazing, which should be done after the figures are nearly finished, for fear of making them too strong.

Curtains should be dead-coloured when we paint the ground; and should be done with clean colours, of a near hue to the intended curtain, such as will support the finishing colours; do it with a tender sort of keeping, and near in regard to their tone in the lights, but much softer in the shadows; all which should be mixed and broken with the colours of the ground. It will often happen, that we cannot make the folds the first painting; we should then leave the masses of light and shadow, in regard to the keeping of the picture, broad and well united together, such as may seem easy to finish on. The colours of the landscape, in backgrounds, should be broken and softened also with those of the parts which join them. This method will make all the parts of the ground, as it were, of one piece.

The sky should be broken with the lead, and the flesh, tints. The murrey tint is of great use in the grounds of distant objects; and the umber and dark shades in the near grounds. The greens should be more beautiful than you intend them, because they will fade and grow darker. After all is painted, go over the whole very lightly with the softener, as you did the grounds, which will make it look agreeably finished.

OF PAINTING LANDSCAPES.

The principal colours used in landscapes

are, 1. flake white; 2. white lead, or common white; 3. fine light ochre; 4. brown ochre; 5. brown pink; 6. burnt umber; 7. ivory-black; 8. Prussian blue; 9. ultramarine; 10. terreverte; 11. lake; 12. Indian red; 13. vermilion, or native cinnabar; 14. king's yellow.

The principal tints are, 1. light ochre and white; 2. light ochre, Prussian blue and white; 3. light ochre and Prussian blue; 4. the same darker; 5. Terreverte and Prussian blue; 6. brown pink and Prussian blue; 7. brown pink and brown ochre; 8. brown pink, ochre, and Prussian blue; 9. Indian red and white; 10. ivory-black, Indian red, and lake.

The colours necessary for dead-colouring are common white, light ochre, brown ochre, burnt umber, Indian red, ivory-black, and Prussian blue.

The principal colours and tints for painting the sky are fine white, ultramarine, Prussian blue, light ochre, vermilion, lake, and Indian red.

The tints are, a fine azure, lighter azure, light ochre and white, vermilion and white; and a tint made of white, a little vermilion, and some of the light azure, at discretion.

Process. — Sketch, or rub in, your design faintly, with burnt umber used with drying oil, and a little oil of turpentine; leaving the colour of the cloth for the lights. Remember, in doing this, to leave no part of the shadows so dark as you intend the first lay or dead-colouring, which also is to be lighter than the finishing colours. Though the foliage of the trees is to be only rubbed in faintly, yet the trunks and bodies should be in their proper shapes, with their breadths of light and shadow. All kinds of buildings should be done in the same manner, leaving the colour of the cloth for their lights. The figures on the fore-ground may also be sketched in the same manner, and then left to dry.

FIRST PAINTING, OR DEAD-COLOURING.

Let the first lay, or dead-colouring, be without any bright, glaring, or strong dark colours; so that the effect is made more to receive, and preserve, the finishing colours, than to show them in their first painting.

The sky should be done first, then all the distances; and so work downwards to the middle group, and from that to the fore-ground, and nearest parts. Remember, all the parts of each group, as trees, buildings, or the like, are all painted with the group they belong to.

The greatest secret in dead-colouring is, to find the two colours which serve for the ground of shadows in general, the sky excepted; and the method of using them with the lights; the first of which is the dark shade with a little lake in it; the other colour is only burnt umber. These should be a little changed to the natural hue of the

objects, and then laid on with drying oil, in the same manner as we shade with Indian ink, which is a kind of glazing, and as such they should be left; otherwise they will be dark and heavy, and therefore would be entirely spoiled for the finishing glazing. Both these colours mix and sympathise agreeably with all the lights, but should be laid before them.

The sky.—The sky should be laid with a good body of colours, and left with a faint resemblance of the principal clouds more in the manner of *claro obscuro* than with finishing colours; the whiter it is left, the better it will bear out and support them; the distances should be made out faint and obscurely, with the dark shades, and some of their lights in different degrees, and laid so, as best to find, and show, their principal parts. All the grounds of the trees should be laid or rubbed in, enough only to leave an idea of their shapes and shadows faintly. The ground of their shadows must be clean, and lighter than their finishing colours.

In painting the lights, it is better to incline more to the middle tint, than to the very high lights; and observe to leave them with a sufficient body of clean colours, which will preserve the finishing colours better; all which may be done with a few tints. After this, go over the whole with a sweetener very lightly, which will soften, and mix, the colours agreeably for finishing.

SECOND PAINTING.

Begin with the sky, and lay in all the azure, and colours of the horizon; then soften them; after that, lay in the general tint of the clouds, and finish on it with the high lights, and the other tints that are wanting, with light tender touches; then soften the whole with a sweetener, very lightly. The finishing of the sky should be done all at one painting, because the tender character of the clouds will not do so well as when the whole is wet. Observe, that the stiffer the azure and colours of the horizon are laid, the better the clouds may be painted upon them.

The greatest distances are chiefly made with the colour of the sky; as they grow nearer and darker, glaze and scumble the parts very thin, with such glazing shadow-colours as come nearest to the general hue of the group the objects are in. This glazing should be understood of a darkish hue; and that the first painting or dead-colour should be seen through it distinctly. On this lay, or ground, add the finishing colours.

Now, supposing this glazed ground properly adapted to the object and place, it will be easy to find the other colours, which are wanted for the lights and finishings of the same; but in laying them you must take care not to spoil the glazing; therefore be very exact in making those colours on the pallet, and then be sure to lay them with light free touches.

Before we proceed any farther, it will be proper to say something of the most useful glazing colours.

Lake, terreverte, Prussian blue, and brown pink, are the four principal. The more you manage them like Indian ink, and the more distinctly you leave them, the better their transparent beauty will stand and appear, provided you do it with good drying oil. After these four glazing colours, burnt umber is a very good glazing warm brown, and of great use in the broken grounds and nearest parts; but the most agreeable colour for the darkest shadows, is the dark shade improved with lake. It is a fine warm shade; mixes harmoniously with all the lights, as well as the shadows; and is excellent in the trunks and bodies of trees, and in all kinds of buildings.

Make out all the ground of the objects with such glazing shadow-colours, as seem nearest to the natural hue of the object in that situation; but as the principal glazing colours themselves are often too strong and glaring, they should therefore be a little changed, and softened with such colours as are of a near resemblance to themselves, and the objects: thus if it is in the distances, the terreverte and the azure, which are the principal glazing colours, may be improved and made lighter with some of the sky-tints; and as the distance comes nearer with the purple. In the middle group, the terreverte and Prussian blue may be changed with some of the green tints; such as are made without white, for white is the destruction of all glazing colours. As you approach the first group, there is less occasion for changing them; but the fore-ground and its objects require all the strength and force of glazing, which the colours are capable of producing.

After this glazing ground, follow with strengthening the same in the shadows, and darkest places, in such manner as will seem easy to finish; which is the first lay of the second painting.

The colours that come next for finishing, are in the degree of middle tints; these should be carefully laid over the greatest breadth of lights, in such manner as not to spoil and cover too much of the glazing. Do it with a good body of colour, as stiff, as the pencil can agreeably manage. Remember, the colours of the middle tint should be of a clean beautiful hue. According to these methods, it will be easy to finish all the second painting down from the sky, through the middle group. As you come to the first group, where all the objects should be perfectly finished, finish their under, or most distant, parts, before you paint any of the other, which appear nearer. Observe this method down to the last and nearest objects of the picture: and where it so happens that painting one tree over another does not release or bear the second until the first is

dry. Thin near trees of different colours will do better, if you let the under parts dry before you add the finishing colours.

THIRD AND LAST PAINTING.

If oiling be necessary, lay on the least possible quantity : which should be done with a stump tool or pencil, exactly proportioned to the place, so as to oil no more than is wanted ; then wipe the whole place that is oiled, with a piece of silk handkerchief.

When going to finish any objects, remember to use a great variety of tints, very nearly of the same colour, but most of all when finishing trees. This gives a richness to the colouring, and produces harmony. The greens will fade, and grow darker ; therefore it is highly necessary to improve and force them, by exaggerating the lights, and making an allowance in using them so much the lighter. For the same reason, great care should be taken not to overcharge and spoil the beauty of the glazing, lest it become dull and heavy.

The method of painting near trees is, to make the first lay very near to nature, though not quite so dark, but more in the degree of a middle tint, and follow it with strengthening the shadows ; then the middle tints ; and last of all lay the high lights and finishing colours. All this cannot be done, as it should be, at one painting, therefore the best way is, to do no more than the first lay with the faint shadows, and leave it to dry.

Then begin with improving the middle tints and shadows, and let them dry.

The third and last work is, adding all the lights and finishing colours in the best manner possible. This method of leaving the first, and second, parts to dry separately, not only makes the whole much easier, and more agreeable, but leaves the colours in the greatest perfection ; because most of the work may be done with scumbling and glazing, and some parts without oiling. The lights also may be laid with a better body of colour, which will not be mixed, and spoiled, with the wet ground.

The figures in the landscape are the last work of the picture ; those in the fore-ground should be done first, and those in the distances should be done next ; for after the figures in the first and farthest group are painted, it will be much easier to find the proportions of those in the middle parts of the picture. And observe, that the shadows of the figures should be of the same hue, or colour, with those of the group or place they are in.

MINIATURE.

This art of painting is practised, either on vellum, or ivory.

The best method, in painting on vellum, is to glue the edge of the vellum to a copper-plate or board, over which it is strained, in this manner : let your vellum be every way

a finger's breadth larger than what you strain it on. Moisten the fair side of the vellum with a piece of fine wet linen, and put a piece of white paper to the other side. Then apply it to the plate or board, stretching it equally in all directions, lap the edges nicely round and glue them, taking care to let no glue pass under the part of the vellum, on which you mean to paint. When the glue dries, and the edges of your vellum are thus fastened, you may proceed with your work ; or you may (agreeably to the practice of some painters) previously give the vellum a light wash of white lead well purified, to serve as a ground.

But ivory being the material most frequently used at present for painting in miniature, the following are the most approved rules for painting on it.

It is scarcely necessary to remark, that the first essential point towards excellence in this, as in all other branches of painting, is a thorough and well-grounded knowledge in drawing, both from plaister, and from the life ; without correctness of drawing the greatest brilliancy of tints will at last be unsatisfactory. We should therefore recommend to the student in miniature, to continue, at his leisure hours, to copy from large drawings or busts, in chalks or water-colours, as correctly as possible, which affords the best means of giving facility to the hand in the drawing of smaller figures.

Painting in miniature is of all the most delicate and tedious in its process, being performed wholly with the point of the pencil. It is only fitted for works of a small size, and must be viewed near.

COLOURS USED IN MINIATURE PAINTING.

In painting the face, the yellows that are used are five, viz. gall-stone, terra Sienna, Nottingham ochre, Roman ochre, and Naples yellow ; the latter three of which are opaque colours, the other transparent. The greens are confined to one, which is sap-green. The blues are verditer, Prussian, indigo, smalt, ultramarine, and Antwerp. The reds are, carmine, drop-lake, Chinese vermilion, and Indian red. Under the class of reds, may also be put burnt terra Sienna, its colour inclining much that way, though more to the orange. The only browns, if any are used in the face, are burnt umber, and terra de Cassel, and they are only to be used in the mixture of dark shades.

For painting draperies, we shall only add to the above colours, lamp-black, king's-yellow, and flake white.

QUALITIES OF THE ABOVE COLOURS WHEN USED IN MINIATURE.

Yellows.—Gall-stone is one of the finest and brightest colours, and a lasting one ; but it should be sparingly used in the flesh-tints, its brilliancy being apt to overpower all the other colours.

Terra di Sienna unburnt, is of a greasy nature, but is used as a warm yellow : burned, it is more beautiful, partaking of three tints, yellow, red, and brown.

Nottingham ochre works well ; but on account of its heavy qualities must be used with caution.

Roman ochre is used with success in miniature painting, as it works, when properly portioned with gum water, extremely sharp and neat ; and being in itself a warm colour, communicates that quality to the tints it is worked in.

Naples yellow, although adopted by some artists, is of a sickly hue, and has this very bad quality, that it absorbs all colours that are either worked on it, or mixed with it.

Blues. — Ultramarine excels all others in permanency.

Prussian blue has no substitute, on account of its strength of effect, and transparency.

Smalt is so hard, that nothing but an agate flag, and muller, will pulverize it sufficiently. It is not to be depended on for permanency.

Indigo is a useful blue, though it must be sparingly used, on account of its extreme depth of colour, nearly approaching to black ; the best is called the rock indigo. The way to judge of its qualities is to break it, and, if good, it will have a copperish hue ; but if bad, it will be of a dead blackish cast.

Verditer is a fine blue, and much used by miniature painters, not only in their sky-grounds, but likewise in the delicate parts of the face. It requires to be very finely ground on a hard flag. As to durability, it changes in time to a dirty greenish colour ; on account of its being made from copper, care should be taken not to put the pencil it is used with much in the mouth, as its qualities are pernicious.

Antwerp blue is extremely deceptive, being, when dry, a most beautiful bright blue ; but when wet and prepared, a very dingy colour, and totally unfit for the face of a miniature. It may be used in blue draperies or back-grounds, but in nothing else.

Sap-green is a highly useful colour, when judiciously mixed with other colours : producing warm fleshy tints, which cannot be produced without it. Its extreme transparency and its permanency, are strong recommendations in its favour.

Reds. — Carmine, is a fine bright crimson, inclining to the scarlet, and is rather an opaque colour ; from it a variety of fine tints may be made. There are various kinds of it prepared by chemists, but the deep kind is the best, the lighter sort being frequently made so by adulteration.

Drop-lake, made from the shearings of scarlet cloth, is a pleasing crimson colour ; its inclining to the purple makes it peculiarly useful for the carnation tints in painting delicate subjects.

Chinese vermilion, when good, is a bright red, and useful in miniature pictures, though not to be freely used, its opacity rendering it dangerous to mix much with other colours ; but by itself, in touching the parts that require extreme brightness, it is of wonderful service. It is very difficult to find the real kind, the common vermilion, mixed with lake or carmine, being a general substitute ; but the spurious, and genuine, kinds very materially differ in working, the former being thick and heavy, the other the contrary.

The native or mineral cinnabar, or vermilion, is likewise very fine in Spain ; and the French have mines of it in Normandy. There is a method of preparing factitious cinnabar ; viz. Take six ounces of sulphur, and eight of quicksilver, mix them well ; then set them on the fire, till part of the sulphur is consumed, and the powder remains black ; after this, it is sublimed twice in open pots, at the bottom of which the cinnabar remains very heavy, and streaked with the lines or needles, some red, and others brilliant like silver ; then take it and purify it in the following manner : grind it well in fair water, on a marble, put it into a glass, or earthen, vessel to dry, then put urine to it, and mix it so that it be thoroughly wet, and swim ; then let it settle, and the cinnabar being precipitated or fallen, pour off the urine by inclination, and put fresh in the room of it, leaving it so all night, and repeating the same every four or five days, till the cinnabar is thoroughly purified. Continue the process with beating up the white of an egg, which, mixing with fair water, pour it upon the cinnabar, and stir the whole about with a walnut-tree stick ; change this liquor two or three times as above, and keep the vessel close covered from dust ; when used for water-colours, temper it with gum-water, and a small quantity of saffron dissolved will add to its brilliancy.

Indian red is an excellent colour, not only for touching the deep red parts, but likewise in strong flesh tints, in bright back-grounds, and draperies.

Browns. — Umber is very greasy, and mixes unkindly ; but when burnt, is very useful in many parts of miniature.

Terra de Cassel, or Vandyck brown, so called from the very great estimation the inimitable painter of that name held it in, is the finest rich brown in the world ; in itself producing a more beautiful colour than can be formed by the junction of any colours whatever. It is, in its natural state, rather coarse and sandy ; but when prepared, it amply repays the labour.

Lamp-black is useful for mixing in hair colour, and in painting draperies. The smoke of a candle received on a plate, is found the best, being blacker than the common lamp-black.

King's yellow is a bright opaque colour, admirably calculated for painting lace, gilt buttons, &c. &c. but is a rank poison, therefore should be cautiously used.

Flake white, or refined white lead, is not to be used by itself as a white, for it will invariably turn black, a circumstance which should be nicely attended to by all artists. If used in miniature painting, for linen, &c. it should be immediately covered with a glass, which method is the only one which stands a chance of preserving its purity.

Among the above necessary colours, there are three which require to be burnt, viz. terra di Sienna, umber, and lamp-black. For this purpose, the two former are to be put in a crucible, which is to be covered and placed on a hot fire, and when you think that the lump of colour is hot through, take the crucible from the fire, and let the colour cool.

The lamp-black is to be prepared thus: take some of the common kind; put it on a clean fire-shovel or plate of iron, over the fire; immediately on receiving the heat, it will begin to smoke, on the ceasing of which you will find your lamp-black freed from the oily substance it originally contained, and fit for immediate use.

Gum-water.—Choose the large white pieces of gum arabic, which are brittle and clear. Put them into a clean phial, and pour water on them, well-strained and divested of all sandy particles. Let the gum-water be about the thickness of water-gruel, that is, so thick that you can feel it in your fingers. The fresher made the better.

GRINDING THE COLOURS, AND PREPARING THEM FOR THE PALLET.

Provide yourself, if possible, with an agate flag, and muller; or, if not conveniently to be had, glass ones may be substituted. The glass muller, and flag, must be lightly roughened with fine flour emery, which will give a surface of some continuance. After being particularly careful that the flag, &c. are quite clean, lay some of the colour to be ground on it, bruising it whilst dry, gently with the muller; then put a few drops of water on it, and grind it very carefully, not making it too wet, as that will prevent it from keeping sufficiently under the muller. When you think it is finely ground in the water, take the pallet-knife, or a thin-edged piece of ivory, scrape the colour together in a little heap on the flag, which let dry for a short time, then add gum-water to it gradually, having a piece of ivory near you, on which you are frequently to lay some of the colour with a camel-hair pencil, thin; and if you perceive the colour in the smallest degree to shine, when dry, it is gummed enough; then you are to scrape it off your flag, and transfer it to your pallet.

There are some colours which will not bear a sufficient quantity of gum to make

them shine, without injuring their qualities, as smalt, ultramarine, and verditer blues.

OF HAIR PENCILS. — MANNER OF CHOOSING THEM, &c.

Pencils for painting in miniature are not made of camels' hair, but of the tips of squirrels' tails, and of these there are two kinds, the dark brown, and yellowish red. Pencils made of the latter kind are called sable pencils, and are of a stiffer nature than the others. They are a useful kind of pencil, as long as the fine flue at the end of the hair remains, on account of their elasticity; but the instant the flue is worn off, they, from their harshness, become useless; at all events, no pencil can be superior to one made of the common kind of hair. The error too prevalent amongst young miniature painters, is that of preferring a very small pencil for their work, vainly hoping, by the assistance of such a one, to execute their picture with more neatness and accuracy; but this is an error which experience testifies; for the finest and most highly-finished pictures are executed with a middle-sized pencil, the point of which being not only sufficiently neat, but from its body containing a quantity of colour in fluid, enables the artist to give that mellow, firm touch, which is so generally admired by connoisseurs. The young artist should choose his pencil, with a good spring, and point, both of which he will know by drawing the pencil lightly through his mouth, and touching it on his thumb-nail; if he find it, on being moderately wet, to spring again into its form, after being bent, it is so far good; but there are many pencils possessed of that quality, which are deficient in another material one, namely, that of a good point. They should be cautiously looked to, by turning the pencil round on the nail, in every direction, observing whether the hairs at the point keep together of a length, none shooting out on either side (which is often occasioned by the pencil-maker putting the hair into the quill with a twist in it.) All these defects being carefully guarded against, a principal material for miniature painting may be presumed upon.

IVORY.—METHOD OF CHOOSING, BLEACHING, AND PREPARING IT.

Of ivory there are various kinds, the distinction of which in this art is of very material consequence. Ivory, newly cut, and full of sap, is not easily to be judged of; the general transparency it exhibits, in that state, almost precluding the possibility of discovering whether it is coarse-grained, or fine; streaky, or the contrary; unless to the artist, who, by a long course of experience, is familiarised to it. The best way to discover the quality of it is, by holding it grainways to the light, then holding it up and looking through it, still turning it from side to side,

and very narrowly observing whether there are any streaks in it; this, unless the ivory is very freshly cut, will be easily discovered. There is a species of ivory which is very bad for painting on, although it has no streaks in it, being of a horny coarse nature, which will never suffer the colours to be thrown out in a brilliant manner; you are therefore not only to be cautious in choosing ivory free from streaks, but likewise that which has the finest grain, and close. We shall now proceed to treat on the manner of preparing the ivory.

You are to heat a smoothing iron in so small a degree, that you can hold your hand on the face of it, so long as you can reckon three or four in moderate time; then put your ivory between a clean piece of folded paper, on which place the hot iron, turning your ivory frequently, until it becomes a *transparent* white; for you are to observe very particularly, that an *opaque* white will not answer for face-painting in miniature, as it would give a harshness and unpleasant appearance to the picture.

When you think your ivory is sufficiently white for your purpose, lay it under some flat weight until it cools, as that will prevent its warping. Then proceed to prepare it: for which purpose you must pound some pumice-stone in a mortar, as clear and fine as possible, which put into a fine linen or cambric bag, tying it, about midway, tight, but leaving room for the pumice-dust to sift through the bottom. Then get a long mustard-bottle, perfectly clean and dry, in which suspend the pumice-dust, covering the top with the muzzle of the bag, so that nothing can come out; then shake the bottle smartly in your hand, when the fine particles of the pumice will sift out, and remain at the bottom of the bottle, thereby preventing any coarse grains from being amongst what you are going to use, which would very materially injure your ivory. Your pumice-dust being prepared, scrape the leaves of ivory with a sharp pen-knife, until the scratches of the cutting-saw are entirely obliterated; then take either a piece of Dutch polishing rush, or a piece of middling fine patent glass paper, and carefully polish your ivory with it, not by passing your hand backwards and forwards, but in a circular manner, until you have it pretty level; then strew some of your pumice-dust on the ivory, and put a few drops of water on it: which done, with your muller work on it in a circular manner as before, until you find every part has equally received the pumice, which you will know by its exhibiting a dead, grave appearance; those parts which have not received the pumice continuing to shine in spots, which you must still labour to do away with your pumice and muller. When you find it pumiced to your satisfaction, take a clean sponge and fair water, with which gently wash your ivory free from the pumice-dust; taking care

not to rub it hard, lest you give the ivory a gloss that would prevent your colours from adhering equally and agreeably: after this, lay your ivory to dry, and in a few hours it will be fit for use. Then paste it on a piece of wove paper, by touching the back of it *merely at the edges*; as gum-water, or any other cement, being put near the *centre* of your ivory, may cause a dark unpleasant spot perhaps to appear through, in the very part where the face is to be painted.

INSTRUCTIONS FOR MIXING COMPOUND TINTS FOR THE FACE.

Purple is formed of either ultramarine, Prussian blue, smalt, or indigo, mixed with either carmine, or drop-lake. Ultramarine, although the most beautiful and brilliant of colours by itself, yet in any mixture it loses that perfection; but still retains a sufficient sear of brightness to render it a desirable tint in the purplish grey shadows of the face. Prussian blue, mixed as before-mentioned, makes a bright, or dark purple, according as the quantities of either colours are portioned; but indigo makes still darker, owing to its great natural depth of colour. Smalt and carmine, or lake, form nearly the same tint as ultramarine, and may be used nearly for the same purposes.

Grey.—Of grey tints there are various kinds, according to the subjects they are required for. A warm grey tint may be made by duly portioning burnt terra Sienna, Prussian blue, and drop-lake: the more terra Sienna in it, the warmer the tint; the more Prussian blue and lake, the colder. Another grey tint, used with success by some eminent miniature painters, was composed of Prussian blue, and Chinese vermilion; but on account of the unkind manner, with which vermilion incorporates with any other colour, it required a greater proportion of gum than ordinary to make them work or keep together. A third grey tint, which is an excellent one, is formed of drop-lake, sap green, and Prussian blue.

Olive tints.—A very fine olive tint is formed of gall stone, Nottingham ochre, and carmine, or lake; and another of sap green and lake simply.

Of hair tints.—A beautiful hair colour, either dark, or light, according to the quantities of colours, is made of carmine, lamp-black, and sap green. The manner of forming it is only to be acquired by practice; but when once attained, will be found worth the time of the trial. That very difficult tint, which is often to be met with in children's hair, by the proper junction of these colours will be produced to perfection. Other hair tints may be made of terra de Cassel simply, or by the addition of lamp-black. Some excellent painters make all their hair tints of burnt terra Sienna, lamp-black, and Nottingham ochre the latter being added only

when there is light hair wanting to be represented. Burnt umber has been substituted for terra Sienna, along with the lamp-black, and forms a good tint; but care must be taken to avoid either the greenish, or reddish, casts, which it is apt to produce.

Tints for fine linen, gauze, &c.—Of all tints in transparent painting, such as are the miniature works of the present day, there are none more difficult to ascertain; for the delicacy not only of mixture, but the delicacy of touch, conveys the idea of beauty in the thinness and folding of fine linen or gauze, the true painting of which throws a veil over the defects in other parts of the picture. We shall therefore only observe, that any of the tints, under the head of grey, will, properly managed, answer the purpose. Having now pointed out the manner of preparing the delicate transparent tints for miniature painting, we proceed to treat of the grosser ones, namely, those for draperies.

OF COLOURS PROPER FOR MEN'S DRAPERIES.

We shall, under this head, make some general observations: the first of which is, that in all cloth draperies for men's portraits, it is necessary to add some flake white, as it not only gives the colour the dead appearance which cloth exhibits, but likewise its being incorporated with the flake white, gives it a body which makes the flesh tints appear to more advantage. The next observation is, that, in grinding up your draperies, you are to make them appear several degrees lighter in colour, than you want them to be when dry; because the flake white is so very heavy, that, after you float in your coat, it will sink to the bottom, and leave your colours several degrees darker than when it was wet; and finally, you are not to be too heavy or thick in floating in your draperies, but merely to see that your colour is evenly spread over the part.

There are four modes of working in miniature painting; namely, floating, washing in, handling, and marking. The first process, which is *floating*, and is chiefly used for draperies, is thus performed: Having marked with your pencil where your drapery is to be, grind up your colour on your flag (not putting a quantity of gum water, sufficient to make it shine, as it would frustrate your purpose); then take a large soft hair pencil, and having previously laid your ivory on a very level table, fill your pencil plentifully with the colour, and lay it quick all over the parts of the ivory you want covered, seeing that it runs on every part equally, which, if kept in a proper fluid state, it will readily do; then lay it in some place to dry, where it is not likely to receive dust, when you will have a fine level surface ready to work the shadows of your drapery on in a couple of hours. *Washing in* is performed when your picture is on your desk, by filling your pencil moderately with colour,

and giving a very broad stroke rather faintly, as the contrary would not answer; this manner is chiefly used in beginning the hair, back grounds, and likewise in laying on the general flesh tint of the face. It is also used in the first touches of the dark shadows, which ought to be begun faint and broad. *Handling* is the manner in which all the fleshy parts of the miniature must be worked, after the first washing in; and lastly, *marking* consists in the sharp-spirited touches given to the different features, in order to give that animated appearance so necessary to constitute a fine picture.

Black drapery is formed of lamp-black burnt, and flake white; and must be laid in with a good deal of the latter, as otherwise it would be very difficult to manage the shadows so, as to produce a pleasing effect.

Blue drapery may be made of either Prussian blue, or Antwerp blue, mixed with white; indigo being too much inclined to a blackish cast.

Green drapery is well made of king's yellow, and Prussian and Antwerp blue. The more blue, the darker the green; and the more yellow, the contrary.

Yellow drapery cannot be so well represented by any colour as king's yellow, laid thin, with a moderate quantity of gum in it.

Drab-colour is well represented by a judicious mixture of umber in its raw state, and flake white.

A queen's brown, as it is called, is made of burnt Roman ochre, a little lamp black and lake, with flake white amongst it.

Claret colour may be well represented by a mixture of terra de Cassel, a little lamp-black, and lake. The more black and lake, the deeper the colour.

Dark brown can be formed by a junction of Nottingham ochre, lake, and lamp-black.

Lilac is made of carmine, Prussian blue, and flake white.

Grey can be formed only of lamp black, flake white, and the smallest quantity of lake laid in very thin.

Reddish brown is best made of Indian red, very little lamp-black, and flake white.

Scarlet is a colour very difficult to lay down rules for making, as in some pictures it is dangerous to make it too bright, for fear of injuring the effect of the face, by its brilliancy catching the eye too readily; consequently, if the subject to be painted from life be very pale, a great risk is incurred by inserting a very bright scarlet in the picture. We shall therefore only mention, that a very bright scarlet is made of Chinese vermilion, and carmine, ground together (without any flake white); and if you want it still rendered brighter, when it is dry, fill your pencil with plain carmine, mixed with thin gum-water, and glaze it over nicely; but if, on the contrary, you wish to sadden, or take away a share of its brilliancy, add a

little flake white to it, and that will have the desired effect.

OF PAINTING THE FACE IN MINIATURE.

You are first to provide yourself with a mahogany desk for painting on, which is a box about fourteen inches high, and a foot-board on the top; there is to be a lid covered with green cloth, which is to have a pair of small hinges at the front, and to lift occasionally with a supporting rail at the back, and notches, so as readily to adjust it to any height. About the middle of the green cloth there is to be a slip of very thin mahogany, glued at each end, but the centre of it left free, to fasten your ivory by, slipping it between the mahogany and green cloth.

The next thing you are to observe is the choice of your light, which in this kind of painting cannot be too particularly attended to; it not being like oil painting, where the rays of the sun may be kept out by blinds, &c. without causing any material inconvenience. A north light, or as nearly as possible to it, must be attained. If there are more windows than one in the room, the second must be closed, so as to admit no light; and the one you sit at, must have a green baize curtain against the lower part of it, to reach about a foot higher than your head, as you sit at your painting desk, with your left hand towards the light.

Having placed your object at the distance of about a yard and a half from you, begin drawing the outlines of the face, with the utmost precision. When you have them drawn correctly, begin to lay in the colour, faintly, of the iris of the eye, the shadows under the eye-brows in a grey tint, and under the nose rather a warm purple, in broad faint washes: ever keeping this in your mind; that you must, in the process of painting the face of a miniature picture, go on faintly at the beginning, and not hurry in your colours, as such conduct will, inevitably, make your tints look dirty, and your picture harsh and disagreeable. Having, as before observed, laid in your grey tints where your shadows are to fall, go on heightening them by degrees, working in hatches with a middling full pencil, not too washy, nor too dry; as the former would be the means of muddying your colours, and the latter would make them raw. When you have pretty strongly marked out, and worked up the shadows, mix a wash of either gall-stone, or Nottingham ochre, and drop-lake, with which faintly go over the fleshy parts of the face, where the shadows do not come, and then proceed to heighten the carnations on the cheeks, the colour of the beard, if any such appears, still working in the handling manner already mentioned, in various directions; so that, after some time working, the intersections appear like so many nice points or dots. Observe, as a general rule, that it

is much easier to warm the tints of your face, than to cool them, by working proper colours over it. It is therefore best to begin with cool greys and purples; and towards the finishing of the picture, to add warmth, if necessary, by gradually working such colours as gall-stone, terra Sienna, or the like, over it, in addition to the carmine or lake that may be necessary to produce the tint of nature.

ELYDORIC PAINTING.

This method of painting was invented by M. Vincent, of Montpetit. It takes its name from two Greek words expressing oil, and water, both these liquids being employed in its execution.

Its principal advantages are, that the artist is able to add to the mellowness of oil-painting, the freshness of water-colours, and the high finishing of miniature, in such a manner, that the work appears like a large picture seen through a diminishing glass.

The following is the manner of proceeding: A piece of very fine linen or white taffety is sized with starch in the most equal manner possible; or pieces of glass about two inches square, the angles of which are blunted, in order that the cloth may be without wrinkles.

When these pieces of cloth are sufficiently dry, a layer of white lead finely ground in oil of pinks, or poppies (the whitest that can be procured) is applied on them with a knife. To this layer, when dry enough to admit of scraping, more may be added if necessary.

As it is of the greatest importance for the preservation of this kind of painting, that the layers are purged of oil, in order that they may imbibe the colours laid on them, it is necessary, that their surface be made very smooth, and be very dry and hard.

The artist is next provided with a circle of copper, nearly two inches in diameter, and one-fourth of an inch in height, extremely thin, and painted on the inside with black. This circle is employed to contain the water on the surface of the picture.

Water distilled from rain, or snow, is preferable to any other: ordinary water, on account of the salts which it contains, being pernicious to this mode of painting.

The colours also must be ground between two Oriental agates, most carefully preserved from dust, and mixed with oil of poppies, or any other siccativ oil, which has been extracted without fire, and limpid as water.

All the colours being ground, are placed in a small heap, on a piece of glass covered with distilled water in a tin box.

The materials being thus prepared, the subject to be painted is faintly traced with a black-lead pencil on one of the pieces of cloth above-mentioned.

The tints are formed on the pallet from

the little heaps under the water, and the pallet placed as usual in the left hand.

The picture is held between the thumb and fore finger, supported by the middle, and the necessary pencils between the third and little fingers. The hand rests on the back of a chair, to give a full liberty of bringing the work near, or removing it from the eye.

The pencils are cleaned with essence of rectified turpentine.

After having made the rough draught with the colours still fresh, the circle of copper, which ought to surround the picture, is fitted, exactly to the surface.

The distilled water is poured within this circle till it rises to the height of one-eighth of an inch, and the eye is held perpendicular over the object. The third finger of the right hand must rest on the internal right angle of the picture.

The artist retouches his work, adding colour, and softening as he finds requisite.

As soon as the oil swims on the top, the water is poured off, and the picture carefully covered with a watch-glass, and dried in a box by a gentle heat.

When it is dry enough to be scraped nearly smooth with a knife, the artist repeats the same method till he is satisfied with his work.

It is at this period that the advantage of this new method particularly shows itself for the purpose of finishing; as the water poured on the picture discovers every fault of the pencil, and gives the power of correcting and perfecting with certainty.

When the work is finished, it is put under a crystal, from which the external air is excluded, and it is then dried by means of a gentle heat.

PAJACK, a Russian corn-measure.

PAKFONG, or **WHITE COPPER**, a metal composed of copper, nickel, and zinc. The zinc amounts to nearly one half of the whole, and the proportions of copper and nickel are as 5 to 13. This compound metal is much used among the Chinese.

PALENDAR, a kind of coasting vessel.

PALLADIUM, a metal discovered by Dr. Wollaston, in the year 1803. It exists in the ores of platina. It is hard, malleable, of a white colour, like platina, ductile, and capable of receiving a fine polish. It fuses with difficulty, and is not altered by exposure to the air at common temperatures. Its specific gravity, is 11.3. It is soluble in aqua-regia, forming a beautiful red solution. Muriate of tin precipitates it of a dark orange colour; it has not been applied to any use, except in the construction of some parts of some philosophical instruments.

PALLET, among painters, a little oval piece of wood, or ivory, with a hole through which to put the thumb of the left hand.

It is to hold the several colours on, ready for the pencil.

PALLET, among potters, &c. a wooden instrument for forming, beating, and rounding their works; of these they have a large oval one with a handle; others are round, or hollowed triangularly; others like large knives, to pare off what is superfluous in their moulds.

PALLET, in gilding, an instrument made of a squirrel's tail, to take up the gold leaves, and extend them on the matter to be gilt.

PALM-BERRIES. Unripe dates are thus called. See **DATES**.

PALM-OIL. (GER. *Palmöl*. DU. *Palmolie*. DA. *Palmeolie*. SW. *Palmolja*. FR. *Huile de Palme*, *Huile de Senegal*, *Pumicin*. IT. *Olio di Palma*. SP. *Aceite de palma*. PORT. *Oleo de palma*. LAT. *Oleum palmæ*, seu *Elais*.) This oil is said to be the produce of the *palm spinosa major*; the fruit or nuts of which are full of oil. It is obtained by boiling them in water, when the oleaginous particles rise to the surface, they are skimmed off, and strained for use. The oil, as it comes to us, is about the consistence of an ointment, and of an orange colour; of a strong but not disagreeable smell, and having very little taste. By long keeping it loses its colour, and becomes white, when it ought to be rejected. The tree which yields palm-oil grows in most parts of Asia, Africa, and America, more especially on the coast of Guinea, in the Cape de Verd islands, and in Jamaica and Barbadoes. The negroes are fond of the oil, which sometimes makes an ingredient of their food. It is used in medicine, by way of embrocation, for strains and rheumatic pains; it is also now frequently mixed up with soap, and reckoned a cosmetic.

PAMPHLET, a small book, usually printed in the octavo form; and sold unbound. No person shall sell, or expose to sale, any pamphlet without name and place of abode of the printer, on pain of 20*l*. and costs. 10 Ann. c. 50. See **NEWSPAPERS**.

PAN, (GER. *Pfannen*. DU. *Pannen*. DA. *Pander*. SW. *Pannor*. FR. *Poêles*. IT. *Padelle*. SP. *Sartenes*. PORT. *Sartagens*, *Frigideiras*. RUS. *Skoworodü*. POL. *Pately*.) a broad and shallow vessel, usually made of copper or iron, and of various dimensions, according to the different uses to which it is to be applied. Besides the pans used for culinary purposes, there are articles of this kind manufactured for the sugar-houses, for salt-works, &c. &c.

PAN, the part of the lock of a gun, that holds the powder.

PANJONIA, a species of crystal, so called from the particularly angular shape in which it is found, being derived from two Greek words expressive of that particularity.

PANNEL, in joinery, is a tympanum, or square piece of thin wood, sometimes carved,

framed, or grooved in a larger piece, between two upright pieces, and two cross pieces.

PANNEL, *in law*, is the schedule of the jurors returned by the sheriff, to pass upon any trial.

PANNEL, *in masonry*, is one of the faces of a hewn stone.

PANNIER, a basket or a wicker vessel, in which fruit, or other things, are carried on a horse. Panniers are much used in the wine countries, for conveying the grapes to the press; but panniers of this description are generally carried upon men's backs, for which purpose they are of a suitable form.

PANORAMA, a picture exhibiting a succession of objects, such as may be by the rays of light intercepted by the surface of a hollow sphere, or cylinder, from all points of external objects to the eye, or the centre of the sphere, or at a fixed point in the axis of the cylinder.

PAN-SAPAN. See **SAPAN-WOOD**.

PANTHERS' SKINS. The panther measures about six feet and a half, and sometimes nearly seven feet from nose to tail, which last is about three feet long. The colour of the panther is a bright and beautiful, tawny yellow, thickly marked all over the upper parts of the body, shoulders, and thighs, with roundish black spots, disposed into circles, consisting of four, or five, separate spots; and there is commonly, but not always, a central spot in each circle, in which particular, as well as in its superior size, and deeper colour, the panther differs from the leopard. On the face and legs the spots are single, and along the top of the back is a row of oblong spots, which are still longer as they approach the tail. The breast, and belly, are white; the former marked with transverse dusky stripes, the latter, and the tail, with large irregular black spots. The skins of the panther are brought from Africa, and are employed in the same manner as those of the leopard.

PANTILE, is that species of tile, which being concave, is employed in the formation of gutters, on the tops of houses. These tiles are subject to an excise duty. See **BRICKS**.

PAPER, (*GER. and DU. Papier. DA. Carta. SW. Papper. FR. Papier. IT. Carta. SP. and PORT. Papel. RUS. Bumaga. POL. Papier. LAT. Charta.*) sheets of thin matter, made of some vegetable substance. Papers are of various kinds; with regard to colours, they may be divided into white, brown, blue, &c.; with regard to quality, into fine, second, bistered, superfine, &c.; with regard to use, into writing, printing, pressing, cap, cartridge, copy, chancery, post, &c. With regard to dimensions, into demy, medium, crown, foolscap, pot, royal, super-royal, imperial, elephant, atlas, &c.; with regard to country, into German, Lombard, Rochelle, Genoese, Dutch, English, &c. We have also print-

ed paper to hang rooms with; stamped paper to write obligations, deeds, and contracts upon; ruled paper for books of account, &c. to which may be added cut and gilt paper for letters, gold, and coloured, paper, for ornamental works of a small kind, and, lastly, metallic paper, for a similar purpose, of recent invention, and singular beauty, &c. Blue paper is used for wrapping up sugar loaves, linen, &c. Whitish-brown, for parcels of almost every kind. Teint, or demi-teint paper, a paper for designing on, is either blue, brown, or bistered. Bistered or bistered paper is white paper washed over with a sponge dipped in soot-water. Its use is to save the labour of the crayon in places which are to be shadowed the same depth with the teint of this paper: for light places they are made with chalk. For bleaching paper, see *Prints and Printed Books*, article **BLEACHING**.

Manufacturers of paper are to take out a license annually at the Excise-office, and to make entries at the nearest office of excise, of their mills, workhouses, &c. under penalty of 50*l*.

The ream of paper is to contain 20 quires of 24 sheets each; pasteboard to be made up into parcels, each parcel to contain even dozens of sheets, and not to have less.

The excise duties attach upon all kinds of paper. See 1 Geo. 4. c. 58.

PAPER-CREDIT, is the paper circulating in the country, and issued upon the security of the bank of England; and as long as the specie is adequate to cover the amount of the notes issued, so long may such paper be considered as money, of which it is the representative.

The mode of accepting and negotiating bills among merchants, falls also within the denomination of *paper-credit*.

PAPER-HANGINGS, (*GER. Papier-tapeten. DU. Papiertapeten. DA. Papir-tapeter. SW. Papperstapeter. FR. Tapisseries de papier. IT. Tapezzerie di carta. SP. Tapicerias de papel. PORT. Tapeçarias de papel.*) are made in several different ways. Some are printed from wooden blocks, and coloured by placing paper over them, cut out in spaces in the forms of the figures, or parts of the figures, where they are to be laid on; over these spaces the artist moves a large brush dipped in any colour, and removes the paper as he proceeds, till the whole piece is finished; and then begins again with other papers cut so as to admit other colours, proceeding in the same manner till the whole piece is completed. Other kinds of paper-hangings are made without their being first printed on blocks, solely by means of papers cut into sprigs and flowers, &c. which are laid on as in the other case, and the figures represented on the paper by brushing over these patterns; which are removed as before, till all the different colours and shades are given,

and the work completed: after which, if the work is designed to be curious, it is touched up, by mending the defects, and giving it proper heightenings, &c. with the pencil. Flock paper-hangings are made in much the same manner. They take flocks, which are the cuttings of the rough nap taken off by the cloth-dresser, this they choose of the proper colours, and cut with an engine as fine as possible; the figure is then represented on paper with a strong varnish; and while it is yet wet and clammy, the flocks are scattered upon it; when that which falls upon the varnished part sticks, and represents the figure designed, and the rest that falls upon the dry paper is shaken off. If the paper is to be of several different colours, as red, green, blue, yellow, &c., the pattern for one of these is drawn with the varnish, and the flocks of that particular colour are spread over the whole piece; which being afterwards thoroughly dried, the shades of the same colour are separately added, and then the other colours with their shades.

PAPER-MAKING. This art is of the most important nature, and well deserves a minute examination as to its origin and progress; but as this research is not compatible with the character of an elementary work, we shall only observe, that it was known to the Egyptians, Greeks, and Romans, from which time, to the present period, it has been successively cultivated by every civilised nation on the face of the globe, and brought, by the English, in particular, to the highest pitch of perfection.

We now proceed to state the process of this branch of manufactures, as it is pursued in the mills of Great Britain.

The first instrument employed in the making of paper is called the duster, made in the form of a cylinder, four feet in diameter, and five feet in length. It is altogether covered with a wire-net, and put in motion by its connection with some part of the machinery. A convenient quantity of rags before the selection are inclosed in the duster, and the rapidity of its motion separates the dust from them, and forces it through the wire. It is of considerable advantage to use the duster before selection, as it makes that operation less pernicious to the selectors.

The selection is then to be made; and it is found more convenient to have the tables for cutting off the knots and stitching, and for forming them into a proper shape, in the same place with the cutting-table. The surface, both of these, and the cutting-table, is composed of a wire-net, which, in every part of the operation, allows the remaining dust, and refuse of every kind, to escape.

The rags, without any kind of putrefaction, are again carried from the cutting-table back to the duster, and from thence to an engine, where, in general, they are in the

space of six hours reduced to the stuff proper for making paper. The hard and soft of the same quality are placed in different lots; but they can be reduced to stuff at the same time, provided the soft is put somewhat later into the engine.

The engine is that part of the mill which performs the whole action of reducing the rags to paste, or, as it may be termed, of trituration. The number of the engines depends on the extent of the paper-work, the force of water, or the construction of the machinery.

When the stuff is brought to perfection, it is conveyed into a general repository, which supplies the vat, from which the sheets of paper are formed. This vat is made of wood; and is generally about five feet in diameter, and two and a half in depth. It is kept in temperature by means of a grate introduced by a hole, and surrounded on the inside of the vat with a case of copper. For fuel to this grate, they use charcoal or wood, and frequently, to prevent smoke, the wall of the building comes in contact with one part of the vat, and the fire has no communication with the place where they make the paper.

Every vat is furnished on the upper part with planks inclosed inwards, and even railed in with wood, to prevent any of the stuff from running over in the operation. Across the vat is a plank which they call the trepan, pierced with holes at one of the extremities, and resting on the planks which surround the vat.

The forms or moulds are composed of wire-cloth, and a moveable frame. It is with these that they fetch up the stuff from the vat, in order to form the sheets of paper. The sides of the form are made of oak, which is previously steeped in water, and otherwise prepared to prevent warping. The wire-cloth is made larger than the sheet of paper, and the excess of it on all sides is covered with a moveable frame. This frame is necessary to retain the stuff, of which the paper is made, on the cloth; and it must be exactly adapted to the form, otherwise the edges of the paper will be ragged and badly finished. The wire-cloth of the form is varied in proportion to the fineness of the paper, and the nature of the stuff.

The felts are pieces of woollen cloth spread over every sheet of paper, upon which the sheets are laid to detach them from the form, to prevent them from adhering together, to imbibe part of the water, with which the stuff is charged, and to transmit the whole of it when placed under the action of the press. The two sides of the felt are differently raised; that, of which the hair is longest, is applied to the sheets which are laid down; and any alteration of this disposition would produce a change in the texture of the paper. The stuff, of which the felts are

made, should be sufficiently strong, in order that it may be stretched exactly on the sheets, without forming into folds; and, at the same time, sufficiently pliable to yield in every direction, without injury to the wet paper. As the felts have to resist the reiterated efforts of the press, it appears necessary that the warp be very strong, of combed wool, and well twisted. On the other hand, as they have to imbibe a certain quantity of water, and to return it, it is necessary that the wool be of carded wool, and drawn out into a slack thread. These are the utensils, together with the press, which are used in the apartment where the sheets of paper are formed.

The vat being furnished with a sufficient quantity of stuff, and of water, two instruments are employed to mix them; the one of which is a simple pole, and the other a pole armed with a piece of board, rounded, and full of holes. This operation is repeated as often as the stuff falls to the bottom. In the principal paper-mills in England, they use, for this purpose, what is called a hog; which is a machine within the vat, that, by means of a small wheel on the outside, is made to turn constantly round, and keep the stuff in perpetual motion. When the stuff and water are properly mixed, it is easy to perceive whether the previous operations have been complete. When the stuff floats close, and in regular flakes, it is a proof that it has been well triturated; and the parts of the rags which have escaped the rollers also appear.

After this operation the workman takes one of the forms, furnished with its frame, by the middle of the short sides; and fixing the frame round the wire-cloth with his thumbs, he plunges it obliquely four or five inches into the vat, beginning by the long side, which is nearest to him. After the immersion he raises it to a level; by these movements he fetches up on the form a sufficient quantity of stuff; and as soon as the form is raised, the water escapes through the wire cloth, and the superfluity of the stuff over the sides of the frame. The fibrous parts of the stuff arrange themselves regularly on the wire-cloth of the form, not only in proportion as the water escapes, but also as the workman favours this effect by gently shaking the form. Afterwards, having placed the form on a piece of board, the workman takes off the frame or deckle, and glides this form towards the coucher; who, having previously laid his felt, places it with his left hand, in an inclined situation, on a plank fixed on the edge of the vat, and full of holes. During this operation the workman applies his frame, and begins a second sheet. The coucher seizes this instant, takes with his left hand the form, now sufficiently dry, and, having laid the sheet of paper upon the felt, returns the form by gliding it along the trepan of the vat.

They proceed in this manner, laying alternately a sheet, and a felt, till they have made six quires of paper, which is called a post; and this they do with such swiftness, that, in many sorts of paper, two men make upwards of twenty posts in a day. When the last sheet of the post is covered with the last felt, the workmen about the vat unite together, and submit the whole heap to the action of the press. They begin at first to press it with a middling lever, and afterwards with a lever about fifteen feet in length. After this operation, another person separates the sheets of paper from the felts, laying them in a heap; and several of these heaps collected together are again put under the press.

The stuff which forms a sheet of paper is received, as we have already said, on a form made of wire cloth, which is more, or less, fine, in proportion to the stuff, surrounded with a wooden frame, and supported in the middle by many cross bars of wood. In consequence of this construction, it is easy to perceive, that the sheet of paper will take, and preserve, the impressions of all the pieces which compose the form, and of the empty spaces between them.

The traces of the wire cloth are evidently perceived on the side of the sheet which was attached to the form, and on the opposite side they form an assemblage of parallel, and rounded, risings. As, in the paper which is most highly finished, the regularity of these impressions is still visible, it is evident that all the operations to which it is submitted have chiefly in view to soften these impressions, without destroying them. It is of consequence, therefore, to attend to the combination of labour which operates on these impressions. The coucher, in turning the form on the felt, flattens a little the rounded eminences which are in relief on one of the surfaces, and occasions, at the same time, the hollow places made by the wire cloth to be partly filled up. Meanwhile, the effort which is made in detaching the form, produces a very great number of small hairs on every protuberant part of the sheet.

Under the action of the press, first with the felts, and then without them, the perfecting of the grain of paper still goes on. The vestiges of the protuberances made by the wires are altogether flattened, and of consequence the hollows opposite to them disappear also; but the traces formed by the interstices of the wire, in consequence of their thickness, appear on both sides, and are rounded by the press.

The risings traced on each side of the paper, and which can be discovered by the eye on that which is most highly finished, form what is called the grain of paper. The different operations ought to soften, but not destroy it; which is effectually done by employing the rammer. This grain appears in the Dutch paper; which is a sufficient proof

that though they have brought this part of the art to the greatest perfection, they have not employed hammers, but more simple and ingenious means. The grain of paper is often disfigured by the felts when they are too much used, or when the wool does not cover the thread. In this case, when the paper is submitted to the press, it takes the additional traces of the warp and the woof, and composes a surface extremely irregular.

The paper, the grain of which is highly softened, is much fitter for the purposes of writing, than that which is smoothed by the hammer: on the other hand, a coarse and unequal grain very much opposes the movements of the pen; as that which is beat renders them very uncertain. The art of making paper, therefore, should consist in preserving, and at the same time in highly softening, the grain: the Dutch have carried this to the highest perfection.

The exchange succeeds the operation last described. It is conducted in a hall contiguous to the vat, supplied with several presses, and with a long table. The workman arranges, on this table, the paper, newly fabricated, into heaps; each heap containing eight, or ten, of those last under the press, kept separate by a woollen felt. The press is large enough to receive two of them at once, placed the one at the other's side. When the compression is judged sufficient, the heaps of paper are carried back to the table, and the whole turned, sheet by sheet, in such a manner, that the surface of every sheet is exposed to a new one, and in this situation they are again brought under the press. It is in conducting these two operations sometimes to four, or five, times, or as often as the nature of the paper requires, that the perfection of the Dutch plan consists. If the stuff be fine, or the paper slender, the exchange is less frequently repeated. In this operation it is necessary to alter the situation of the heaps, with regard to one another, every time they are put under the press; and also, as the heaps are highest towards the middle, to place small pieces of felt at the extremities, in order to bring every part of them under an equal pressure. A single man with four, or five, presses, may exchange all the paper produced by two vats, provided the previous pressing at the vats be well performed. The work of the exchange generally lasts about two days on a given quantity of paper.

When the paper has undergone these operations, it is not only softened in the surface, but better felted, and rendered more pliant in the interior parts of the stuff. In short, a great part of the water, which it had imbibed in the operation of the vat, is dissipated. By the felting of paper is understood the approximation of the fibres of the stuff, and their adhering more closely together. The paper is felted in proportion as the

water escapes, and this effect is produced by the management, and reiterated action, of the press. Was it not for the gradual operation of the press, the paper would be porous, and composed of filaments adhering closely together. The superiority of the Dutch over the French paper, depends almost entirely on this operation.

If the sheets of paper are found to adhere together, it is a proof that the business of the press has been badly conducted. To avoid this inconveniency, it is necessary to bring down the press at first gently, and by degrees with greater force, and to raise it as suddenly as possible. By this means the water, which is impelled to the sides of the heaps, and which has not yet escaped, returns to the centre; the sheets are equally dry, and the operation is executed without difficulty.

According to the state of dryness, in which the paper is found when it comes from the apartment of the vat, it is either pressed before, or after, the first exchange. The operation of the press should be reiterated, and managed with great care; otherwise, in the soft state of the paper, there is a danger that its grain, and transparency, are totally destroyed. Another essential principle to the success of the exchange is, that the grain of the paper is originally well raised. For this purpose the wire cloth of the Dutch forms is composed of a rounder wire than that used in France, by which they gain the greatest degree of transparency, and are in no danger of destroying the grain. Besides this, the Dutch take care to proportion the wires, even where the forms are equal to the thickness of the paper.

Almost every kind of paper is considerably improved by the exchange, and receives a degree of perfection which renders it more agreeable in the use. But it is necessary to observe, at the same time, that all papers are not equally susceptible of this melioration; on the contrary, if the stuff be unequal, dry, or weakened by the destruction of the fine parts, it acquires nothing of that lustre and softness, and appearance of velvet, which the exchange gives to stuff properly prepared.

The sheds for drying paper are in the neighbourhood of the paper-mill, and are furnished with a vast number of cords, on which they hang the sheets, both before, and after, the sizing. The sheds are surrounded with moveable lattices, to admit a quantity of air sufficient for drying the paper. The cords of the shed are stretched as much as possible; and the paper, four or five sheets of it together, is placed on them by means of a wooden instrument resembling a pick-axe. The principal difficulty in drying the paper consists in gradually admitting the external air, and in preventing the cords from imbibing moisture. With regard to the first of these, the Dutch use very low

sheds, and construct their lattices with great exactness. By these means the Dutch paper is dried equally, and is extremely supple before the sizing. They prevent the cords from imbibing the water, by covering them with wax. In using such cords, the moisture does not continue in the line of contact between the paper, and the cord, which prevents the sheet from stretching in that particular place by its weight, and from the folds which the moisture in the subsequent operations might occasion. The Dutch also employ cords of considerable thickness, and place fewer of them under the sheets; by which means they diminish the points of contact, and give a freer, and more equal, circulation to the air.

The size for paper is made of the shreds and parings got from tanners, curriers, and parchment-makers. All the putrefied parts, and the lime, are carefully separated from them, and they are inclosed into a kind of basket, and let down by a rope and pulley into the cauldron. This invention serves two valuable purposes. It makes it easy to draw out the pieces of skin that remain when the size is extracted from them by boiling, or easy to return them into the boiler if the operation be not complete. When the substance is sufficiently extracted, it is allowed to settle for some time; and it is twice filtered, before it is put into the vessel into which they dip the paper.

Immediately before the operation, a certain quantity of alum is added to the size. The workman takes a handful of the sheets, smoothed, and rendered as supple as possible, in his left hand, dips them into the vessel, and holds them separate with his right, that they may equally imbibe the size. After holding them above the vessel for a short space of time, he seizes on the other side with his right hand, and again dips them into the vessel. When he has finished ten, or a dozen, of these handfuls, they are submitted to the action of the press. The superfluous size is carried back to the vessel by means of a small pipe. The vessel in which the paper is sized is made of copper, and furnished with a grate, to give the size when necessary a due temperature; and a piece of thin board, or felt, is placed between every handful, as they are laid on the table of the press.

The Dutch are very careful in sizing their paper, to have every sheet in the same handful of equal dryness; because it is found that the dry sheets imbibe the size more slowly, than those which obtain some degree of moisture. They begin by selecting the pages in the drying-house; and after having made them supple, and having destroyed the adherence between the sheets, they separate them into handfuls, in proportion to the dryness, each of them containing that number which they can dip at one time. Besides this precaution, they take care to apply

two sheets of brown paper of an equal size to every handful. This brown paper, firm, solid, and already sized, is of use to support the sheets.

As soon as the paper is sized, it is the practice at some paper-mills to carry it immediately to the drying-house, and hang it before it cools, sheet by sheet, on the cords. The paper, unless particular attention be paid to the lattices of the drying-house, is apt to dry too fast, whereby a great part of the size goes off in evaporation; or, if too slow, it falls to the ground. The Dutch drying-houses are the best to prevent these inconveniences; but the exchange after the sizing, which is generally practised in Holland, is the best remedy. They begin this operation on the handfuls of paper, either while they are still hot, or otherwise as they find it convenient. But, after the exchange, they are careful to allow the heaps to be altogether cold, before they are submitted to the press. Without this precaution, the size would, either be wholly squeezed out by the press of the exchange, or the surface of the paper become very irregular. It is of consequence that the paper, still warm from the sizing, grow gradually firm, under the operation of the exchange, in proportion as it cools. By this method it receives that varnish which is afterwards brought to perfection under the press, and in which the excellence of the paper, for writing or drawing, chiefly consists. It is in consequence of the exchanging, and pressing, that the Dutch paper is soft and equal; and that the size penetrates into the body of it, and is extended equally over its surface.

The exchange, after the sizing, ought to be conducted with the greatest skill and attention, because the grain of the paper then receives impressions which can never be eradicated. When the sized paper is also exchanged, it is possible to hang more sheets together on the cords of the drying-house. The paper dries better in this condition, and the size is preserved without any sensible waste, because the sheets of paper mutually prevent the rapid operation of the external air. And as the size has already penetrated into the paper, and is fixed on the surface, the insensible progress of a well-conducted drying-house renders all the good effects more perfect, in proportion as it is slowly dried.

If to these considerations be added the damage done to the paper in drying it immediately after the press of the sizing-room, whether it be done in raising the hairs by separating the sheets, or in cracking the surface, it is evident that the trouble of the second exchange is infinitely overpaid by the advantage.

When the paper is sufficiently dry, it is carried to the finishing-room, where it is pressed, selected, examined, folded, made up into quires, and finally into reams. It is

here put twice under the press ; first, when it is at its full size, and secondly, after it is folded.

The principal labour of this place consists in assorting the paper into different lots, according to its quality and faults ; after which it is made up into quires. The person who does this must possess great skill, and be capable of great attention, because he acts as a check on those who separated the paper into different lots. He takes the sheets with his right hand, folds them, examines them, lays them over his left arm, till he has the number requisite for a quire, brings the sides parallel to one another, and places them in heaps under the table. An expert workman, if proper care has been taken in assorting the lots, will finish in this manner near 6000 quires in a day.

The paper is afterwards collected into reams of 20 quires each, and for the last time put under the press, where it is continued, for ten or twelve hours, or as long as the demand of the paper-mill permits.

Various substitutes have been projected for linen-rags in the manufacture of paper ; and specimens have been produced, made from the bark, leaves, straw, wood, &c. of different plants, shrubs, and trees. The following are the principal substances from which paper has been produced, viz. cotton, the pith of thistles of every kind, the withen or sallow of hemp, hop-lines, brown or blue cabbage-stalks, the stalks of the mallow, maize, the woolly catkins of white poplar, the stalks of common broom, the straws of flax, the stalks of common sunflower, peat, grass-wrack, tendrils of the vine, the horn-beam tree, the stalks of the mugwort and clematis ; and lastly, which is perhaps the best substitute, barley-straw.

PAPER-MILL. When the art of paper-making was first introduced into Europe, the rags used in the manufacture were ordinarily beaten into a pulp by means of large heavy hammers, whose heads were raised up by cogs fixed in the axis of a water-mill ; but they are now more expeditiously ground to pieces, by means of an iron barrel, covered with teeth, fixed on the inside of an iron cylinder, and turned by the same wheel which supplies the mill with water. This is what may properly be called the paper-mill, although the rooms in which the vats are fixed, together with the drying-rooms, &c. are usually comprised in this appellation. See the preceding article.

PAPIER-MACHE', is a substance made of outtings of white, or brown, paper, boiled in water, and beaten in a mortar till they are reduced into a kind of paste ; and then boiled with a solution of gum arabic, or of size, to give tenacity to the paste, which is afterwards formed into different toys, &c. by pressing it into oiled moulds. When dry, it is covered with a mixture of size and lamp-black, and afterwards varnished.

If this operation be properly performed, the article will be hard, durable, and glossy, and will bear liquors, either hot, or cold. It is of papier maché that the bodies of the most valuable japanned tea-trays, and other articles of a like description, are formed.

PAPER-STAINING is an art very similar to that of calico-printing, and requires similar qualifications. Stained paper pays a duty of excise, the laws respecting which prohibit the clandestine staining of paper, under heavy penalties. This is a most valuable source of commerce, but the French rival us in the art, and by many are thought to excel us.

PAR. When two things, of different denominations, are equal to each other in value, they are then said to be with respect to each other equal, or at par. The public funds are said to be so much above, or below, par, as they exceed, or fall short of, sterling value ; thus, when the three per cents. were at 98 $\frac{1}{2}$, they were said to be two per cent. below par, or 100% sterling in value.

Gold and silver are at par with the coin of the country, when the coin melted down will sell for the same that it passed current for in the form of money ; the exchange between two countries is said to be at par, when the monies of each pass for their real value in bullion, without any fictitious depression, or value, arising from the plenty, or scarcity, of the one or the other.

PAR OF EXCHANGE. See EXCHANGE.

PARA, a measure that the Portuguese use in India for pulse. Its weight twenty-two pounds Spanish, and is one twenty-fifth of the moudrais.

PARADISE, Bird of. This bird is of some value, in a commercial point of view, on account of its plumage, with which, of late years, ladies have ornamented their head-dresses.

There are several species of the genus to which the bird of Paradise belongs.

1. The largest bird of Paradise. The description of its plumage is as follows : the head, and back part of the neck, are lemon-coloured, a little black about the eyes ; the neck is of the brightest glossy emerald-green, soft like velvet, as is also the breast, which is black ; the wings are chesnut-coloured ; the back part of the body is covered with long, straight, narrow feathers, of a pale-brown colour, similar to the plumes of the ostrich. On both sides of the belly are two tufts of stiff and short feathers, of a golden yellow, and shining. From the rump proceed two long stiff shafts, which are feathered on their extremities. This species is found in the Aroo islands, and in New Guinea. This is the bird so highly prized in England for ladies' head-dresses.

2. The smaller bird of Paradise. The head and neck are of a dirty yellow, the back of a greyish-yellow, the breast and belly of

a dusky colour, and the wings chesnut. The colours of this bird are less bright than the former, to which in other respects it is pretty similar.

3. The king bird of Paradise. This creature is about seven inches long, and somewhat larger than a titmouse. The crown of the head is flame-coloured, the neck and breast are of a chesnut-colour, with a ring of the brightest emerald-green. Its wings are red and shining, with spots and stripes. Two naked black shafts project from the rump, having at their extremities semi-lunar twisted plumage, of the most glaring green colour above, and dusky below. The belly is white and green sprinkled, and on each side is a tuft of long plumage, feathered with a broad margin, being on one side green and on the other dusky. The back is blood-red and brown, shining on silk. This bird is also an inhabitant of New Guinea.

PARADISE, *Grains of*. See GRAINS OF PARADISE.

PARAGRAPH, in jurisprudence, is a section or division of the text; an article: in common parlance, a short, distinct, integral sentence or passage.

PARAH, an East Indian measure.

PARANTHINE. This stone (so called because its crystals have frequently a dull appearance as if they had effloresced) is found at Arendahl, in Norway. Its prismatic crystals are variously grouped in the iron ore of Langloe, and accompanied with brown mica, quartz, garnet, strahlstein, carbonate of lime, &c.

It exhibits great variety of colour and appearance. Sometimes it is grey and translucent; at others, grey or yellowish, with a pearly lustre; sometimes of a grey colour, and almost a metallic brilliancy; sometimes dull, and of a dead red, like common sealing-wax.

When it is translucent and shining, it is sufficiently hard to scratch glass; but when otherwise it is soft, and even friable. Before the blow-pipe it swells, and fuses into a shining white enamel.

PARAPHERNALIA, are the woman's apparel, jewels, and other things, which, in the life-time of her husband, she wore as the ornaments of her person, to be allowed by the discretion of the court, according to the quality of her and her husband. The husband cannot devise such ornaments and jewels of his wife, though, during his life, he has power to dispose of them. But if she continue in the use of them till his death, she shall afterwards retain them against his executors and administrators, legatees, and all other persons, except creditors, where there is a deficiency of assets. 2 Bl. 436.

PARASANG, a Persian measure, of four thousand paces.

PARASOLS, (GER. *Sonnenschirme*. DU.

Parasols, *Zonneschermen*. DA. *Søllhatte*. SW. *Solskarm*. FR. *Parasols*. IT. *Parasoli*, *Sollecchi*. SP. *Parasoles*. PORT. *Chapeos de sol*.) are portable shades, made in the form of an umbrella, but much smaller in size, and are usually carried by our ladies in order to protect their complexions from the effects of the sun. Parasols are covered with silks of various colours, but the green, brown, purple, and white, are most predominant. The handles of these fashionable articles are generally jointed at top, so that the shade may be inclined, at pleasure, either to the one side, or the other; there is likewise a joint in the middle of the handle, whereby the parasol may be readily reduced to a compact form. Parasols are manufactured, and sold, by those who deal in umbrellas.

PARCEL, is a term indifferently applied to small packages of wares, and to large lots of goods. In this latter sense, 20 hogsheads of sugar or more, if bought at one price, or in a single lot, are denominated "a parcel of sugar."

PARCELS, *Bill of*, a schedule of the items accompanying a parcel.

PARCHMENT, (GER. *Pergament*. DU. *Perkement*. DA. and SW. *Pergament*. FR. *Parchemin*. IT. *Cartapeccora*, *Pergamena*. SP. *Pergamino*. PORT. *Pergaminho*. RUS. and POL. *Pergamin*. LAT. *Pergumena*, *Membrana*.) the skin of sheep or goats prepared after such a manner, as to render it proper for writing upon, covering books, &c.

The manufacture of parchment is begun by the skinner, and finished by the parchment-maker. The skin having been stripped of its wool, and placed in the lime-pit, the skinner stretches it on a kind of frame, and pares off the flesh with an iron instrument; this done, it is moistened with a rag, and powdered chalk being spread over it, the skinner takes a large pumice-stone, flat at bottom, and rubs over the skin, and thus scours off the flesh; he then goes over it again with the iron instruments, moistens it as before, and rubs it again with the pumice-stone, without any chalk underneath: this smooths and softens the flesh-side very considerably. He then drains it again, by passing over it the iron instrument as before. The flesh-side being thus drained, by scraping off the moisture, he in the same manner passes the iron over the wool or hair-side; then stretches it tight on a frame, and scrapes the flesh-side again; this finishes its draining: and the more it is drained, the whiter it becomes. The skinner now throws on more chalk, sweeping it over with a piece of lamb-skin that has the wool on, and this smooths it still farther. It is now left to dry, and when dried, taken off the frame by cutting it all round. The skin, thus far prepared by the skinner, is taken out of his hands by the parchment-maker, who first, when it is dry, pares it on a summer (which

is a calf-skin stretched in a frame) with a sharper instrument than that used by the skinner, and working with the arm from the top to the bottom of the skin, takes away about one-half of its thickness. The skin thus equally pared on the flesh-side, is again rendered smooth, by being rubbed with the pumice-stone, on a bench covered with a sack stuffed with flocks, which leaves the parchment in a condition fit for writing upon. The parings thus taken off the leather, are used in making glue, size, &c.

What is called vellum, is only parchment made of the skins of abortives, or at least sucking-calves. This has a much finer grain, and is whiter, and smoother, than parchment; but is prepared in the same manner, except in not being passed through the lime-pit.

The parchment made in France is supposed to be superior to that of any other part of Europe, and we not unfrequently import the article from that country. Parchment and vellum are fit for several purposes, such as writing, covering books, &c.

PARDAO, or PARDO XERAFIN, a silver money of a base alloy, which the Portuguese stamp in India, current at Goa, and on the coast of Malabar. It is worth nearly three hundred reis, or twenty fanons. There are also one-half, and one-fourth, pardoes, and some say there are likewise double ones. This money is frequently counterfeited by the Indians.

PARDAOS DE REALES, a name given to the Spanish dollars that are current in India. There is a certain value fixed upon them, from which they never lower, but often rise according to the necessity of the times.

PARDOS, a species of silver money current at Mozambique, and along the coast of Africa. It is worth 200 reis.

PEREIRA-BRAVA, (GER. *Amerikanische Grieswurzel*. Du. *Graveelwortel*. DA. *Amerikansk gruusrod*. Sw. *Grusrot*. Fr. and It. *Pereira-brava*. Sp. *Parreiraebrava*, *Butua*. PORT. and LAT. *Pereira brava*.) a hard, woody, crooked root, of a dark colour on the outside, and marked with various wrinkles, which run longitudinally and circularly. Its internal substance is of a dull yellowish colour, and interwoven with ligneous fibres. This root has no smell, but a little bitterish taste, blended with a sweetness, like that of licorice. Some of the roots are no bigger than a man's finger, others as big as a child's arm. This root is the produce of a species of wild vine, which is found abundantly in many parts of Brazil. *Pereira-brava* is only used in medicine.

PARERE, a corruption of an Italian word, *mi pare*. It denotes the advice of a merchant when consulted on any point. These pareres obtain in most trading cities, and serve as acts before notaries, when given by authority of a judge-conservator, or at a

particular consultation for maintaining the right of the consultor.

PARGASITE, a mineral lately found at the village of Ersley, near Abo, in Finland. It is of a green colour, and is transparent. Its crystals are of various sizes, from an inch downwards. Its form is an octohedron, with a rhomboidal base. It surpasses fluor spar in hardness, but is scratched by quartz; and itself scratches glass. Specific gravity 5.11. It melts before the blow-pipe into a mass of a pearly white lustre. Its chemical constituents are silex, magnesia, lime, alumina, oxides of iron and manganese, fluoric acid, water, and the oxide of a metal at present unknown.

PARGETING, in building, the plastering of walls, and sometimes the plaster itself.

PARIAN MARBLE. In a strict sense, this appellation is only bestowed upon the white marble, which, for centuries past, has been dug in the island of Paros. This is the white marble which the ancients used, and which we to this day use for carving statues, &c. whence it is oftentimes styled statuary marble. Too many of the later writers have confounded all the white marbles under the name of Parian; and the workmen give to this, and all the other white marbles, the common name of alabaster; as if there were no such thing as alabaster different from marble. The true Parian marble has usually somewhat of a faint blueish tinge among the white, and often has blue veins in different parts of it. It is said to resist the action of the chisel more than most other kinds of marble, and, if not cut with care, is apt to fly off in flakes.

PARLIAMENT, *Acts of*. See STATUTES.

PAROLE, or, as it usually written now, *Parol*, a term signifying any thing done verbally, or by word of mouth, in contradistinction to what is written; thus some agreements may be by parole; but the 29 Car. 2. c. 3. requires that "all agreements and contracts, where there is no payment, tender, or delivery, for the sale of goods above the value of 10*l*. shall be in writing, and not by parole." 2 *Black. Com.* 448. Evidence also may be divided into parole, and written. Parole evidence is that by which most cases are tried in courts of common law, and especially in mercantile transactions; for, even in actions on bills, bonds, policies, &c. the written record must generally be supported, identified, or explained by parole testimony. Written evidence is that which principally prevails in courts of equity. 3 *Black. Com.* 368. 1 *Dick. Pract. Expos.* 456.

PARTIAL LOSS, implies a damage which a ship may have sustained in the course of her voyage, from any of the perils

mentioned in the policy of insurance. When applied to the cargo, it means the damage which goods may have received, without any fault of the master, by storm, capture, stranding, or shipwreck; although the whole, or the greater part thereof, may arrive in port. These partial losses fall upon the owners of the property so damaged, who must be indemnified by the underwriter. But the underwriters of London expressly declare, as appears from a memorandum at the foot of the policy, that they will not answer for partial losses, not amounting to three per cent. This clause was intended to prevent the underwriters from being continually harassed by trifling demands. But at the same time that they provide against trifling claims for partial losses, they undertake to indemnify against losses, however inconsiderable, that arise from a general average. When we speak of the underwriters being liable to pay, whether for total, or partial, losses, it must always be understood, that they are liable only in proportion to the sums which they have underwritten. Thus if a man underwrites 100*l.* upon property valued at 500*l.* and a total loss happen, he shall be answerable for 100*l.* and no more, that being the amount of his subscription; if only a partial loss, amounting to 60*l.* or 70*l.* per cent. upon the whole value, he shall pay 60*l.* or 70*l.* being his proportion of the loss. The general rules as to a partial loss, and its consequences, were first settled in the case of *Lewis v. Rucker*, (2 Burr. 1167. *et seq.*) whence much information is to be drawn; but the whole of the law on this part of the subject is more intricate and perplexed than on any other question of insurance. In a case of more recent date, (*Johnson v. Shedden*, 2 East. 581.) it was held that the rule by which to calculate a partial loss on a policy on goods, by reason of sea-damage, is, the difference between the respective gross proceeds of the same goods when sound, and when damaged, and not the *net* proceeds; it being settled that the underwriter is not to bear any loss from fluctuation of market, or port duties, or charges after the arrival of the goods at their port of destination.

When goods are partially damaged, the underwriter must pay the owner such proportion of the *prime cost* or value, in the policy, (or if no value is stated in the policy, then of the invoice price, with all charges and premiums of insurance,) as corresponds to the proportion of diminution in value occasioned by the damage. Where an entire thing, as one hogshhead of sugar, happens to be spoiled, if you can fix whether it be a third, or fourth, worse, then the damage is ascertained; but this can only be done at the port of delivery, where the whole damage is known, and the voyage is completed (2 Burr. 1167.); whether the price of the

commodity be high, or low, it equally ascertains the proportion of damage, though no regard is to be paid to the rise, or fall, of the markets, as to the sum to be paid by the insurer, which is in either case to be regulated only by the prime cost, or invoice price. Nor is regard to be paid to the difference of exchange. (*Thelluson v. Bewick*, 3 Espinasse, p. 77.)

Where the property is of various kinds an account is to be taken of the value of the whole, and the proportion of that as the amount of the goods lost. *Park*, 111.

The underwriters of London will not be liable for losses arising from the *inherent corruption* of perishable articles, nor for any partial loss happening to corn, fish, salt, fruit, flour, or seed. If any policy do not contain a memorandum to this effect, and that any partial loss happen to a perishable commodity, the underwriter is liable. See title INSURANCE.

PARTNER, is a merchant or tradesman who embarks with another in mutual traffic, of which he shares the profit in such proportion, as is agreed upon by articles entered into between them.

The act of one partner in behalf of the concern, is the act of both, and they are generally bound by it; but in case of a process at law, both parties must be served with copies, or arrested, before the plaintiff can proceed to judgment, unless an outlawry be obtained against the absent partners. It would be for the benefit of trade, if persons entering into co-partnership were obliged to declare, by an advertisement in the public gazettes, the names of those concerned. A debt to a company is not cancelled by the private debts of the partner; and when a partner becomes insolvent, the company is not bound for his debt beyond the extent of his share; the debts of the company are preferable on the company's effects, to the private debts of the partners. The smallest share in a business subjects the shareholder to the same responsibility, as if it were a large one; but a share in a ship, in building a house, or any specific object, does not constitute a general partnership, any farther than in that object; the degree of possible responsibility in such case is therefore limited, and not dangerous. An agent who is paid by a proportion of the profits of an adventure, does not thereby become a partner in the goods. 5 Taunt. 74.

Navigable canals, insurance companies, mines, and a variety of other undertakings, are divided into shares by virtue either of special or general acts of parliament, principally for the purpose of exempting the shareholders from any responsibility as partners in the enterprise; in which cases, the sum actually subscribed, or expended, is the measure of the greatest possible loss.

Partnership is generally dissolved by the

death of a partner; yet when there are more partners than two, it may, by agreement, subsist among the survivors: sometimes it is stipulated, that, in case of the death of a partner, his place shall be supplied by his son, or some other person agreed on. The contract ought to specify the time, and manner, in which the surviving partners shall account with the executors of the deceased for his share of the stock, and a reasonable time should be allowed for that purpose.

When a partnership is dissolved, there are often outstanding debts that cannot be recovered for some time, and also effects that cannot, with facility, be disposed of; the partnership, though dissolved in other respects, will still, therefore, subsist for the management of their outstanding affairs; and the money, when recovered, is divided among the partners, or their representatives.

If a partner withdraw, he continues responsible for his former partners, till it be publicly known that he have done so: it is usual and advisable, not only to advertise a dissolution of a co-partnership in the Gazette, but also in some of the public papers; and likewise to give notice to every correspondent, by letter, otherwise the firm will not be exonerated from their responsibility.

If, on an execution against one of two partners, the partnership goods be taken and sold; the sheriff is to pay over to the other a share of the produce, proportioned to his share in the partnership effects.

If there are several joint partners, and a person has dealings generally with one of them in matters concerning their joint trade, whereby a debt becomes due to the said person, it shall charge them jointly and the survivors of them; but if the person only dealt with one of the partners upon a separate account, in that case the debt shall only affect that partner and his executors. If one, or more, of the joint traders become bankrupt, his, or their, proportions are only assignable by the commissioners, to be held in common with the rest who are not bankrupts. If one of two partners become a bankrupt, the commissioners cannot meddle with the interest of the other, for it is not affected with the bankruptcy of his companion.

One of two partners drew bills in his own name, which he procured to be discounted with a banker, through the medium of the same agent who procured the discount of other bills drawn in the partnership firm with the same banker. The latter had no remedy against the partnership, though the proceeds were carried to the partnership account. the money being advanced solely on the security of the partners, whose names were on the bills, *by way of discount*, and not by way of loan

to the partnership, and even though at the time the banker imagined the bills were drawn on the partnership account. *Emly v. Lye*. 15 East. R. 7.

Articles of Co-partnership for carrying on a Joint Trade.

Articles of agreement, indented, &c. between — of the one part, and — of the other part, Witnesseth, that the said — and — have joined, and by these presents do join themselves to be co-partners together, in the art or trade of —, and all things thereto belonging; and also in buying, selling, and vending, of all sorts of goods, wares, merchandizes, and commodities, belonging to the said trade of —, which said co-partnership is to continue from the day of the date hereof, for and during, and unto the full end and term of — years from thence next ensuing, and fully to be complete and ended; and to that end and purpose, he, the said —, hath, on the day of the date of these presents, delivered in, as a stock, the sum of —, and the said — the sum of —, to be used, laid out, and employed, in common between them, for the management of the said trade of —, to their utmost benefit and advantage: and it is agreed, between the said parties to these presents, and the said co-partners, each for himself respectively, and for his own particular part, and for his executors and administrators, doth severally, and not jointly, covenant, promise, and agree to, and with the other partner, his executors and administrators, by these presents, in manner and form following; that is to say, that they, the said co-partners, shall nor will, at any time hereafter, use, exercise, or follow the trade of — aforesaid, or any other trade whatsoever, during the said term, to their private benefit or advantage; but shall and will, from time to time, and at all times during the said term, if they shall so long live, do their and each of their best endeavours, in and by all means possible, to the utmost of their skill and ability, for their joint interest, profit, benefit, and advantage; and truly employ, buy, sell, and merchandise, with the stock aforesaid, and the increase thereof, in the trade of — aforesaid, without any sinister intentions, or fraudulent endeavours whatsoever: and also, that they, the said co-partners, shall, and will, from time to time, and at all times hereafter, during the said term, pay, bear, and discharge, equally between them, the rent of the warehouses which they, the said co-partners, shall rent or hire for the joint exercising or managing the trade aforesaid, and all other charges and expenses whatsoever attending the said joint trade and co-partnership: and that all such gain, profit, and increase, that shall come, grow, or arise, for, or by reason

of the said joint trade and co-partnership as aforesaid, shall be, from time to time, during the said term, equally and proportionably divided between them, the said co-partners, share and share alike; and also that all such loss that shall happen to the said joint trade, by bad debts, ill commodities, or otherwise, without fraud or collusion, shall be paid and borne equally and proportionably between them: and further, it is agreed by and between the said co-partners, parties to these presents, that there shall be had and kept, from time to time, and at all times during the said term and co-partnership, perfect, just, and true books of account, wherein each of the said co-partners shall duly enter and set down, as well all such sum and sums of money by them received, paid, expended, and laid out, in and about the management of the said trade, as also, all goods, wares, merchandise, and commodities, by them, or either of them, bought and sold, by reason or means, or upon account of the said co-partnership, and all other matters and things whatsoever, relating to the said joint trade, and the management thereof, in any wise belonging or appertaining; which said books shall be used in common between the said co-partners, so that either of them may have free access thereto, without any interruption of the other; and also, that they, the said co-partners, once in three months, or oftener, if need shall require, upon the reasonable request of either of them, shall make, yield, and render, each to the other, or to the executors of each other, a true, just, and perfect account, of all profits and increase, by them, or either of them, made, and of all losses by them, or either of them, sustained; and also, of all payments, receipts, disbursements, and all other things whatsoever, by them made, received, disbursed, acted, done, or suffered, in their said co-partnership and joint trade as aforesaid; and after the same account, so made, shall, and will, clear, adjust, pay, and deliver, each unto the other, at the time of making such account, his equal share of the profits so made as aforesaid; and at the end of the term of ——— years, or other sooner determination of these presents (be it by the death of one of the said co-partners or otherwise), they, the said co-partners, each to the other, or in case of the death of either of them, the surviving party, to the executors or administrators of the party deceased, shall and will make a true, just, and final account of all things, as aforesaid, and divide the profits aforesaid, and in all things well and truly adjust the same; and upon the making of such final account, all and every the stock and stocks, as well the gains and increase thereof, which shall appear to be remaining, whether consisting of money, goods, wares, merchandise, commodities, or debts, shall be equally divided between the said co-partners, their executors,

or administrators, share and share alike. In witness, &c. &c.

Memorandum between two Persons who agree to enter into Co-partnership.

Memorandum of an agreement made the ——— day of ———, in the year of our Lord, ———, between ——— of ——— of the one part, and ——— of ——— of the other part, as follows, viz. the said ———, in consideration of the sum of ——— of lawful money of Great Britain, to him in hand paid by the said ———, the receipt and payment whereof the said ——— doth hereby acknowledge, doth hereby assign unto him the said ———, one half of all the goods merchandise, chattels, stock, and utensils in trade, belonging to, the said ———, and situate in the warehouse and accounting house of the said ———, as is more fully mentioned in the inventory of the same, hereunto annexed (book debts, and printed books excepted); and the said ——— further agrees, that the said ———, for the considerations aforesaid, shall be entitled to one-half of the profits arising from the trade or business of ———, to be carried on by the said ———, share and share alike; and the said ——— agrees to pay one equal share of the expenses and loss with the said ———, that shall arise in carrying on the said trade or business of ———, making the partnership to commence on the day of the date hereof; and so to continue, until the term of ——— years is fully complete and ended; and it is further agreed, that the said ——— shall not pay, or be liable to pay, any debt or debts contracted by the said ——— before the day of the date hereof; neither shall the said ——— be entitled to receive any debt or debts that shall be due to the said ———, before the date hereof; and further, the said parties do mutually agree, that in case either of the said parties shall die before the expiration of the said term of ——— years, the executors, administrators, or assigns, of the party deceased, shall grant one calendar year to the surviving party, to settle and adjust all matters relating to the said partnership. In witness, &c.

PARTNERSHIP, is when two or more persons unite in trade, and agree to participate in the profits and losses, according to their respective shares in the capital. To constitute a partnership, a *communio* of profit and loss between the parties is essential; and this is the true criterion by which to judge when the question is, whether persons are to be considered as partners, or not. *Cope v. Eyre*, 1 H. B. 45. 48.

But in some respects an individual partner, or a particular partnership, consisting of two or more such persons as are partners in some large concern, may be considered as third persons in transactions in which the general partnership may happen to be engaged with a correspondent. 1 B. & P. 546.

PARTNERSHIP, in an arithmetical sense, is a general rule by which merchants, &c. trading in company with a joint stock, are enabled to ascertain each person's particular share of the gain, or loss, in proportion to his share in the stock. This rule divides itself into two parts, viz. 1. Partnership without regard to time; and, 2. Partnership with time.

Partnership without Time.

RULE. As the whole stock is to the whole gain, or loss; so is each man's share in the stock, to his share of the gain, or loss.

EXAMPLE. Two merchants embark in business; the one puts in as capital 5550*l.* and the other 5420*l.* and they gain in the first year 1260*l.* what is each man's share?

$$\begin{array}{r} \text{£}5550 \\ 5420 \\ \hline 8970 \text{ Joint stock.} \end{array}$$

8970*l.* : 1260*l.* :: 5550*l.* : 779*l.* 12s. nearly;
of course the profits of the other are 1260*l.*
—779*l.* 12s. = 480*l.* 8s.

Partnership with Time.

RULE. As the sum of the product of each man's money and time, is to the whole gain or loss, so is each man's product to the share of the gain and loss.

EXAMPLE. Two persons lay out 1500*l.* in trade, in the proportion of 3 to 2: i. e. A. put in 900*l.* and B. 600*l.* A. leaves his money in the concern for 9 months, and B. does not want his for 12 months: what profits belong to each, supposing they gain 250*l.*?

$$\begin{array}{r} \text{£}900 \times 9 = 8100 \\ 600 \times 12 = 7200 \\ \hline 15300 \\ 15300 : 250 :: 8100 \\ \quad \quad \quad 250 \\ \hline 15300)2025000(133 \end{array}$$

<i>Answer.</i>	A's share of profit,	133
	B's, - - - - -	117
		£250

PART-OWNERS, are those that are concerned in ship-matters, and who have joint shares therein. And when there are part-owners of a ship, the majority may fit her out, without the consent of the rest; and if they do, such majority run all hazards, and are to partake of the profits. *Show.* 13. 30.

Action lies as well against the part-owners of a ship for the loss or spoiling of goods delivered to the master, as against the master; for, as the master of the ship is chargeable in respect of his wages, so are the part-owners in respect of the freight; but the action against the part-owners must be

brought against all of them, or the defendants may take advantage of it by pleading in abatement, &c. *See* OWNERS OF SHIPS.

PARTY-WALLS are partitions of brick or stone, made between contiguous buildings, for preventing the spreading of fires. These are prescribed by 14 Geo. 3. c. 78., with divers other regulations respecting houses in the metropolis, too multifarious to be even abstracted or epitomized here.

Tenant of a house covenanted in his lease "to pay a reasonable proportion of supporting all party-walls, &c., and to pay all taxes, &c., it being the intention that the landlord should receive a *clear yearly rent* of 60*l.* in net money without deduction. During the lease the proprietor of the adjoining house built a party-wall between that house and the demised house. Held that the tenant, and not the landlord, was bound to pay a moiety of the expenses. *Barrett v. Duke of Bedford*, 8 T. R. 602.

If two persons have a party-wall, one-half the thickness of which stands on the land of each, they are not therefore tenants in common of the wall, or of the land on which it stands, and although the wall was erected at their joint expense. *Matts v. Hawkins*, 5 Taunt. 20.

PASS. *See* PASSPORT.

PASS HEMP, (*GER.* *Passhanf.* *Du. Passhennip.* *DA.* *Pass-hamp.* *Sw.* *Passhampa.* *FR.* *Chanvre pass.* *Reparon.* *IT.* *Canape di terze sorte.* *SP.* *Canamo de tercera sorte.* *PORT.* *Linho canhamo da terceira sorte.* *RUS.* *Polowka*.) is hemp thrice carded, and prepared for the fabrication of cloth. *See* HEMP.

PASSENGERS. Almost numberless are the statutes which protect, and regulate the numbers and treatment of, passengers on board British ships to all parts of the world. *See* title SHIPPING, and TRADE. Those which most directly bear upon the subject are 43 Geo. 3. c. 56.—53 Geo. 3. c. 56.—56 Geo. 3. c. 83. and 114.—57 Geo. 3. c. 10.—58 Geo. 3. c. 59.—and 58 Geo. 3. c. 89.

PASSPORT or **PASS**, a licence or writing obtained from a prince or governor, granting permission, and a safe conduct, to pass through his territories without molestation: it is also a permission granted by any state to navigate in some particular sea, and contains the name of the vessel, and that of the master, together with her tonnage and the number of her crew, certifying that she belongs to the subjects of a particular state, and requiring all persons at peace with that state, to suffer her to proceed on her voyage without interruption. *See* MEDITERRANEAN PASS.

This term is also used for a licence granted by a prince, for the importation, or exportation, of merchandise, moveables, &c. without paying the duties. Merchants procure such passports for certain kinds of commodities. Passport is also

ed for the importing, or exporting, of merchandise deemed contraband, and declared such by tariffs, &c. as gold, silver, precious stones, ammunition, horses, corn, wool, &c. upon payment of the duties.

PASTE, a cement composed of wheat-flour and water, boiled till it be of a reasonable consistence; used for joining papers together, for putting up paper-hangings, and for various other purposes.

PASTE, a composition in imitation of diamonds, which is made in the following manner: Take of fine white sand, six pounds; of red lead, four pounds; of pearl-ashes purified, three pounds; of nitre, two pounds; of arsenic, five ounces; and of manganese, one scruple. Powder and fuse them. By means of the calces of metals, various colours may be communicated, so as to imitate rubies, sapphires, emeralds, and every other species of precious stones.

PASTEBOARD, (*GER. Pappe, Pappdeckel. Du. Bordpapier. DA. Pappapir. Sw. Bottenpapper. FR. Carton. Ir. Cartone. SP. Carton. PORT. Papeldão. RUS. Listü bumashnia. POL. Tektura.*) a kind of thick paper, formed of several sheets pasted together, and pressed. There is also a coarser kind of pasteboard, made of old paper, &c. reduced to a pulp in a trough, in the same manner as paper, to which a little paste is added, to give the mass some consistence: after which it is formed in a mould, and reduced to its proper thickness by pressing.

PASTEL, or **PASTIL**, (*Pastels, GER. Pastellfarben. Du. Pastelverwen. DA. Pastelfarver. Sw. Pastellfärgor. FR. Crayons en pastel. Ir. Pastelli, Paste da dipingere. SP. Pasteles, Pasta de colores. PORT. Pasteis.*) a paste made of several colours, ground up in gum water, either together or separately, in order to make crayons. *See* **CRAYONS**.

PASTIL is likewise a sort of dry composition, of a fragrant smell, when burnt, to scent the air. They are composed of odorous resins, mixed with aromatic woods, or drugs pulverized, and incorporated with mucilage of gum tragacanth. It also denotes troches or lozenges.

PATACCOON, a Spanish coin worth four shillings and eight-pence English.

PATENT. The conditions, on which a patent is granted for any new invention, are, that such invention be *original*; and *never before executed in this country*: that it be beneficial to the public, and that the patentee give in, within three months from the date of obtaining the patent, such a specification or description of the original invention, that other persons conversant with the subject may put it in practice at the expiration of the term for which the patent is granted.

When a patent is solicited, the petition is submitted to his majesty's attorney, or solicitor-general, the assent of one of whom is necessary; but this is so seldom refused, that obtaining it may generally be regarded as a

matter of course: the law respecting patents being so constituted, that if one should be obtained improperly, no public damage will ensue, neither can any individual be wrongfully injured thereby.

Patents are for fourteen years, and the expense of obtaining them is from 100*l.* to 110*l.*; the patentee is allowed the exclusive privilege of preparing and vending the object for which such patent has been obtained; but this privilege, although exclusive, is nevertheless conditional; for if any person can adduce evidence that the same was in use before, the condition is not complied with, and the patent is void.

As the patent may either be for the invention of a new object, or for a new method of preparing or manufacturing one already known, the specification should be made accordingly; and if any person discover another method of producing the same subject, or find any substitute without employing the means described in the specification, he is free to exercise such invention, notwithstanding any former grant; and if he obtain a patent for the same, it will be equally good, and the first patent can extend to nothing beyond what is included and expressed in the specification.

Great care should be taken, in drawing up the specification, to make it comprehend all the various methods which human ingenuity can devise for executing what is intended to be secured, as from want of a due attention to this, many disappointments, ruinous in their consequences, have ensued.

The term of a patent may be extended by an act of parliament, on the ground, that the nature of the invention is such, as not to reimburse, and properly reward, the inventor during the usual period of fourteen years.

If a patentee find that any one has infringed upon his privilege, he may, by making an affidavit to that purpose, obtain an injunction to stop the invader, or to give security to pay damages, in case the encroachment on his patent be found to be unfair: in this case, the matter is referred to a jury, and able chemists, mechanics, or other persons conversant in the subjects, are called upon to give their opinion; witnesses are examined also as to the originality of the invention, and the jury decides according to what appears to them to be the merits of the case. There have been of late years many very important trials of this nature, in some of which the patents have been set aside, and in others the injunction confirmed; in which latter case, damages are awarded, according to the circumstances.

An invention having been practised in another country, does not prevent a patent from remaining in force, although the importation of an invention to this kingdom does not, according to the strict letter, institute the patentee, such not being his original invention, but the spirit of the law is

complied with, and according to this, the courts of justice have decided; for as the privilege is given for fourteen years to reward a person for introducing a beneficial object, and the public receives the same benefit, whether it is an importation, or an invention, the patent is good: for it has been decided not to be a reward of merit, but a privilege granted, in order to enable the person, who renders a service to the public, to reap the benefit attached to a business which he has been the means of introducing into the country.

PATTEN, a shoe of wood, with an iron ring underneath; worn by women to keep them from the dirt.

Patten-makers shall not make pattens of asp, 4 Hen. 5. c. 3. May use such asp as is not fit for shafts. 4 Edw. 4. c. 9.

PATTERNS are specimens or samples of various commodities, which are either transmitted by manufacturers to their correspondents, or carried from town to town by travellers, in search of orders. Patterns, if not exceeding one ounce weight, shall be charged by the post only as single letters; provided they be sent under cover, open at the sides, and without any letter or writing, except the name of the person sending the same, the place of his abode, and the price of the article or articles.

PAU, a long measure, used at Loango de Boaire, and in some other places on the coast of Angola in Africa. There are three sorts of paws at Loango. That of the king and his favourite prime ministers, that of his princes and captains, and that of individuals. The first is twenty-eight inches, the second twenty-four, and the third sixteen inches and a half, in length.

PAUT, the Indian flax.

PAWLE, in a ship, a small piece of iron bolted to one end of the beams of the deck, close to the capstan; but yet so easily, as that it can turn about. Its use is to stop the capstan from turning back, by being made to catch hold of the whelps; they, therefore, say, "heave a pawle;" that is, heave a little more, for the pawle to get hold of the whelps; and this they call "*pawling the capstan*."

PAWN, a pledge lodged for the security of the payment of a sum of money borrowed. As the party who pawns the goods has a general property therein, they cannot be forfeited by the person that has them in pawn, for any offence of his; neither can they be taken in execution for his debt; on the other hand, where goods are repawned for money, if after judgment is obtained against the pawner for debt, the goods in the pawner's hands are not liable to execution, until such time as the money lent is paid to the pawner. He that borrows money on a pawn, is to have again the pledge; when he repays the same, or he may bring an action for detaining it; and his very tender

of the money revests the special property in him. Likewise, it has been held, that where a broker refuses, on tendering the money, to redeliver the goods, he thereupon shall be indicted. But a summary remedy is now given by statute, by complaint to a justice of the peace. (See the next article.) In case goods were pawned for lent money, and no day fixed for their redemption, they were redeemable at any time, during the pawner's life: but where redeemable on a certain day, it must be strictly observed, or upon failure of payment the goods might be sold, as well before the statute, as since.

PAWNBROKER, is a person who advances money upon pledges, for which he is allowed interest after the rate of 25 per cent. The rates of interest established, and the substance of the law for the regulation of pawnbrokers, are now as follow: by 39 & 40 Geo. 3. c. 99.

£	s.	d.		£	s.	d.

And for every sum exceeding 40s. and not exceeding 10*l*. at the rate of three-pence in the pound, by the calendar month, including the current month; and so in proportion for any fractional sum.

Pawnbrokers are to give farthings in exchange.

Persons applying to redeem goods pawned within seven days after the first calendar month, after the same shall have been pledged, may redeem the same without paying any thing for the first seven days; and, upon applying before the expiration of fourteen days of the second calendar month, shall be at liberty to redeem such goods, upon paying the profit payable for one calendar month, and the half of another; and in all cases where the parties so entitled, and applying as aforesaid, after the expiration of the first fourteen days, and before the expiration of the second month, the pawnbroker is allowed to take the interest of the whole second month; and the same regulations and restrictions shall take place in every subsequent month.

When goods are pawned for more than 5*s*. the pawnbroker, before advancing the money, shall immediately enter in his books a description of the pawn, the money lent thereon, the day of the month and year, the name of the person pawning, and the name of the street, and number of the house, if numbered, where such person resides, and

use the letter L, if the person be a lodger, and the letters H. K, if a housekeeper; and also the name and abode of the owner of the party offering such pledge; and if the money lent shall not exceed 5s. such entry shall be made within four hours after the goods shall have been pawned; and the pawnbroker shall, at the time of taking the pawn, give to the person so pawning a duplicate, corresponding with the entry in the book, which the party pawning shall take in all cases; and the pawnbroker shall not receive any pledge, unless the party so pawning shall receive such duplicate.

Rates payable for Duplicates.

	£.	s.	d.
If under 5s. - -	0	0	0
5s. and under 10s.	0	0	0½
10s. and under 20s.	0	0	1
20s. and under 5l.	0	0	2
And upwards -	0	0	4

The duplicate to be produced to the pawnbroker before he shall be compelled to redeliver the respective goods and chattels, except as hereinafter excepted.

The amount of profits on duplicates shall be added on pledges redeemed, and such duplicate shall be kept by the pawnbroker for one year.

Persons pawning other people's goods without their consent, may be apprehended by the warrant of one justice, and convicted in a penalty not exceeding 5l. nor less than 20s. and the full value of the goods pawned; and if the forfeiture be not immediately paid, the justice shall commit the party to the house of correction, to be kept to hard labour for three calendar months; and if within three days before the expiration of the commitment the forfeiture shall not be paid, the justice may order the person to be publicly whipped, and the forfeitures shall be applied towards making satisfaction to the party injured, and defraying the costs; but if the party injured shall decline to accept such satisfaction and costs, or if there be any overplus, such forfeitures or overplus shall be paid to the poor of the parish.

Persons forging or counterfeiting duplicates may be seized and delivered to a constable, who shall convey them before a justice, and, upon conviction, such persons shall be committed to the house of correction for any time not exceeding three calendar months.

Persons offering pledges, not giving a satisfactory account of themselves, or the means by which they became possessed of such goods, or wilfully giving any false information, or if there shall be reason to suspect that such goods are stolen, or illegally obtained, or if any person not entitled to redeem goods in pawn shall endeavour to redeem the same, they may be seized and delivered to a constable, to be carried before

a justice; and if there should appear ground for a second examination, they shall be committed to the common gaol or house of correction, to be dealt with according to law; or where such proceedings are not authorized by the nature of the offence, the party shall be committed for any time not exceeding three calendar months.

Persons buying or taking in pledge unfinished goods, linen, or apparel, intrusted to others to wash or mend, shall forfeit double the sum lent, and restore the goods.

Peace-officers are empowered to search for unfinished goods which shall be come by unlawfully.

When goods are unlawfully pawned, the pawnbroker is to restore them; and their houses may be searched during the hours of business, by a warrant from a magistrate, for the discovery of such property.

Persons producing notes or memorandums are to be deemed the owners of the property.

Where duplicates are lost, the pawnbroker, upon affidavit made by the owner of such loss, before a magistrate, shall deliver another duplicate.

Goods pawned are deemed forfeited at the end of a year; but, on notice from persons having goods in pledge, three months further are to be allowed beyond the year for redemption.

An account of sales is to be entered by pawnbrokers in a book, and the overplus is to be paid to the owner of the goods pawned.

No pawnbroker shall purchase goods while in his custody, and no pledge shall be taken from persons under twelve years of age, or who shall be intoxicated.

Pawnbrokers are to place in view the table of profits; and their name and business is to be placed over the door, on penalty of 10l.

Pawnbrokers injuring goods, or selling them before the time limited, upon application to a magistrate, shall be compelled to make satisfaction for the same; and if the satisfaction awarded shall be equal to, or exceed, the principal and profit, the pawnbroker shall deliver the goods pledged to the owner, without being paid any thing for principal or profit.

Pawnbrokers shall produce their books before a magistrate; or, refusing so to do, shall forfeit a sum not exceeding 10l. nor less than 5l.

Pawnbrokers offending against this act, shall forfeit for every offence not less than 40s. nor more than 10l.

PAY, in the sea language. The seamen say, "Pay more cable," when they mean to let out more cable.

PAYEE, the person to whom a bill is made payable; and also the person entitled to receive payment of any sum of money.

PAYER, he who binds himself to the

payment of bills, bond, or any sum of money, either verbally or by writing.

PAYING, among seamen. When the seams of a ship are laid over with a coat of hot pitch, it is called paying her; and when this is done with canvas, parcelling; also when, after she is graved, and the soil burned off, a new coat of tallow and soap, or one of train-oil, rosin, and brimstone boiled together, is put on her, that is also called paying of a ship.

PAYMENT, is the consideration or purchase-money for goods, and may be made by the buyer giving to the seller the price agreed upon, either by bill or note, or by money. Where a day certain is appointed for payment, the party bound shall be allowed till the last moment of the day to pay it in, if it is an inland bill. 4 T. R. 175.

Payment of money before the day, is, in law, payment at the day; for it cannot, in presumption of law, be any prejudice to him to whom the payment is made, to have his money before the time; and it appears by the party's receipt of it, that it is for his own advantage to receive it then. 5 Co. 117.

Payment of money shall be directed in its appropriation by the party paying it, and not by the receiver.

A note drawn on A to pay money for value received, is a good discharge of a debt, though the note be not paid, unless the creditor return the note in a convenient time.

If A give B a bill of exchange upon C in payment of a former debt, this will be no evidence in an action unless paid; for no bill shall ever go in discharge of a precedent debt, unless it were part of the contract that it should do so.

When a merchant draws his bill upon a correspondent, who accepts it, this is payment, for it makes him debtor to another person, who may bring his action.

If a bill or note be paid under any misapprehension of facts, or the law arising from such facts, which the party making such payment was under no legal obligation to discharge, such money may be recovered back, in an action for money had and received to the use of the plaintiff.

PAYMENT, *prompt*, means immediate payment, for which, in this country at least, in transactions of magnitude, a discount is generally allowed of one per cent.

PEAK, or **PEEK**, in the sea language, is a word used in various senses. Thus the anchor is said to be a-peak, when the ship, being about to weigh, comes over her stern in such a manner that the cable hangs perpendicularly between the hawse and the anchor. To heave a-peak, is to bring the peak so that the anchor may hang a-peak. A ship is said to ride a-peak, when lying with her main and fore-yards hoisted up, one end of her yards is raised down to the shrouds, and the other raised up on end; which is chiefly done when she lies in rivers,

lest other ships falling foul of the yards should break them. Riding a broad peak, denotes much the same, excepting that the yards are only raised to half the height. Peak is also used for a room in the hold, extending from the bits forward to the stem; in this room men of war keep their powder, and merchantmen their victuals.

PEARL-ASHES, (GER. *Perlasche*. DU. *Paereläsch*. SW. *Perlaska*. DA. *Perleske*. FR. *Perleasse*, *Cendres de perle*. IT. *Cenere di perla*. SP. *Cenizas de perlas*. PORT. *Canza de perolis*.) a kind of fixed alkaline salt. It is prepared by mixing the ashes of burnt wood with water, evaporating the clear ley, and calcining them for a considerable time in an oven moderately hot. The goodness of pearl-ashes is distinguished by their strong body, and an uniform white appearance; and their value decreases in proportion, as they assume a blue cast. This article being subject to an adulteration, by the addition of common salt, the fraud can be discovered, by taking a small quantity of the suspected matter, and letting it lie to soften in the air, and then putting it in a shovel over the fire; if it contains any common salt, a crackling, and kind of slight explosion, will take place, as soon as the salt grows hot.

Pearl-ashes are chiefly prepared in Russia, Poland, Hungary, and North America; they are much used in the manufacture of glass, as also for bleaching, &c.

A patent, dated 2d April, 1791, was obtained for producing from wood ashes a much greater quantity than usual of pearl and pot-ashes. The process recommended was that of sifting a small proportion of lime among the wood-ashes, before they are put in the calcining furnace, which will prevent them from vitrifying; but if they are at times stirred with an iron rake, or other proper instrument, during the process of calcination, that will answer the purpose of the lime; and when the ashes are calcined into a fine powder, the usual method may be pursued, but it is better to boil them in large vessels, especially in frosty weather.

PEARL BARLEY, (GER. *Gerstengraupen*, *Perlgrauen*. DU. *Gepeldegarrst*, *Peldegarrst*. DA. *Bangebyg*, *Perlegryn*. SW. *Perlgryn*, *Hedgryn*. FR. *Orge perlé*, *Orge mondé*. IT. *Orzo perlato o pilato*, *Orzo brillato o tedesco*. SP. *Cebada perlada*, *Cebada mondada*. PORT. *Cevada perlada*, *Cevada mondada*. RUS. *Krupa*, *Krupa perlowa*. POL. *Krupy*, *Krupki*, *Perlowe krupki*. LAT. *Hordeum excoriatum*.) likewise called *Peeled* and *French Barley*, is nothing more than the common barley freed of the husk by a mill, and reduced to the size of small shot, all but the very heart of the grain being ground away. It is used in the composition of diet drinks, being considered of a cooling, and lubricating, nature.

PEARLS, (GER. *Perlen*. DU. *Paarlen*.

DA. *Perler*. Sw. *Pärlor*. Fr. *Perles*. It. *Perle*. Sp. *Perlas*. Port. *Perolas*. Rus. *Shemtschug*, *Perliu*. Pol. *Perly*. Lat. *Margarita*,) hard, white, shining bodies, usually roundish, found in various kinds of testaceous fishes.

Pearls, though esteemed of the number of gems by our jewellers, and highly valued, not only at this time, but in all ages, are conjectured to proceed only from a distemper in the creature that produces them, analogous to the bezoars, and other stony concretions in several animals of other kinds.

The fish, in which the largest and finest pearls are usually produced, is the East Indian pearl-oyster, as it is commonly called. Besides this shell there are many others that are found to produce pearls; as the common oyster, the muscle, and several others, the pearls of which are often very good; but those of the true Indian *berberi* or pearl-oyster, are in general superior to all. The small or *seed pearls*, also called ounce-pearls, from their being sold by the ounce, and not by tale, are the most numerous and common; but as they increase in size, they are proportionably less frequent, and become of higher price. We have Scotch pearls frequently as large as a little tare, some as big as a large pea, and some few of the size of a horse-bean; but these are usually of a bad shape, and of little value in proportion to their weight. The finest, and what is called the true shape of the pearl, is a perfect round; but if pearls of a considerable size are of the shape of a pear, as is not unfrequently the case, they are not less valued, as they serve for ear-rings and other ornaments. Their colour ought to be a pure white; and that not dead and lifeless, but clear and brilliant: they must be perfectly free from any foulness, spot, or stain; and their surfaces must be naturally smooth and glossy, for they bring their natural polish with them, which art is not able to improve.

All pearls are formed of the matter of the shell, and consist of a number of coats spread with perfect regularity one over another, in the manner of the several coats of an onion, or like the several strata of the stones found in the bladders, or stomachs, of animals, only much thinner.

In the East Indies, there are two seasons for pearl-fishing; the first is in March and April, and the last in August and September; and the more rain there falls in the year, the more plentiful are these fisheries. At the beginning of the season there are sometimes 250 barks on the banks: the larger barks have two divers, and the smaller one. As soon as barks arrive at the place where the fish lie, and have cast anchor, each diver binds a stone, six inches thick, and a foot long, under his body, which serves him as ballast, prevents his being driven away by the motion of the

water, and enables him to walk more steadily under the waves. They also tie another very heavy stone to one foot, by which they are very speedily sent to the bottom of the sea: and as the oysters are usually firmly fastened to the rocks, they arm their hands with leather mittens, to prevent their being wounded in pulling them violently off; but this task some perform with an iron rake. In the last place, each diver carries down with him a large net, in the manner of a sack, tied to his neck by a long cord, the other end of which is fastened to the side of the bark. This net is to hold the oysters gathered from the rock; and the cord is to pull up the diver when his bag is full, or when he wants air. In this equipage he sometimes precipitates himself sixty feet under water; and as he has no time to lose, he no sooner arrives at the bottom, than he begins to run from side to side, tearing up all the oysters, he meets with, and cramming them into his net.

At whatever depth the divers are, the light is so great, that they easily see whatever passes in the sea; and to their great consternation, sometimes perceive monstrous fishes, from which all their address in muddying the water, &c. will not save them, but they unhappily become their prey: and of all the dangers of the fishery, this is one of the greatest, and most usual. The best divers will keep under water near half an hour, and the rest do not stay less than a quarter. During this time they hold their breath, without the use of oils or any other liquors, only acquiring the habit by long practice. When they find themselves straitened, they pull the rope to which the bag is fastened, and hold fast by it with both hands; when those in the bark, taking the signal, heave them up into the air, and unload them of their fish, which vary from five hundred oysters, to fifty. Some of the divers need a moment's respite to recover breath; others jump in again instantly, continuing this violent exercise, without intermission, for several hours.

On the shore they unload their barks, and lay their oysters in an infinite number of little pits dug in the sand four, or five, feet square, raising heaps of sand over them to the height of a man; and in this condition they are left till the rain, wind, and sun, have obliged them to open, which soon kills them; upon this the flesh rots and dries; and the pearls, thus disengaged, fall into the pit on their taking out the shells. After clearing the pits of the grosser filth, they sift the sand several times, in order to find the pearl; but, whatever care they take, they always lose a great many. After cleaning and drying the pearls, they are passed through a kind of sieve, according to their sizes. The smallest are then sold as seed pearls, and the rest put up to auction, and sold to the highest bidder.

Pearls are generally divided into oriental, and occidental, more from their qualities, than their place of produce, the oriental being, as we before observed, reckoned the best. The principal oriental pearl-fisheries are in the Persian Gulf, and on the coasts of Persia and Arabia; near the islands of Ceylon, Java, Manaar, Sumatra, and Borneo; on some of the coasts of Japan; between Banana and Cochín; off Cape Comorin, and in other parts along the Malabar coast, particularly at Tutticorin, where there is an excellent pearl-bank in possession of the Dutch. The most remarkable pearl fisheries of America are in the Gulf of Mexico, along the coast of New Spain; of St. Margarite, or the Pearl Island; in the Rio de la Hacha, at the islands of St. Martha, Quibo, Gorgonia, &c. In Europe, pearls are found occasionally on the coasts of Scotland, Livonia, Courland, in the rivers of Bohemia, and Bavaria, in certain lakes near Augsburg, and in some other places.

There are pearls of various colours, of an exquisite silver-like brightness, semi-transparent, opaque, opal-coloured, yellow, greenish, blueish, greyish, reddish, brownish, blackish, and rainbow-coloured. One of the largest pearls hitherto known is described by Tavernier, in the possession of the king of Persia. It was bought by him at the fishery of Catifa in Arabia, for the sum of 32,000 tomanis, or above 110,000*l*. It is in the shape of a pear, very regular, and without fault. The diameter measured on the engraving in Tavernier's Travels, is 0.63 English inch, at the largest part, and the length 1.3 inch. Another pearl, belonging to the Great Mogul, and perfectly round, mentioned by the same author as the largest in the world of that figure, measured 0.62 English inch in diameter. It has been said there is one in the English crown, worth 10,000*l*. sterling. A pearl, called from its figure the sleeping lion, that weighed five hundred and seventy-eight carats, was offered for sale at Petersburg in 1779 by a Dutchman. On one side which was flattish it was beautifully striped. It was bought in India for 4500*l*.

The weight of pearls is estimated in Europe by carats, in Persia by abases, and in Golconda and Visapour by ratis, each abas and rati being one eighth part less than a carat. The weight of small pearls is expeditiously ascertained, by a brass instrument with holes of different sizes; so that the weight of a pearl is known from the hole it fits. Small irregular pearls are valued from the number that make up an ounce. Neumann gives the following rates: if a hundred make an ounce, they are valued at one hundred rix-dollars; if the number be less, the price is greater; if the number be greater, the price is less. Two hundred to the ounce cost but seventy rix-dollars; three hundred, fifty; nine hundred, ten; two thousand,

three; four thousand, two and a half. Of the very small sort, called seed pearls, an ounce usually contains eight or ten thousand, and costs, if the pearls be of the oriental kind, two rix dollars; if occidental, one rix dollar and twelve gros.

Attempts have been made to take out stains from pearls, and to render the foul opaque-coloured pearls equal in beauty to the oriental. Abundance of processes, not to be depended on, are found in books of receipts and travels. Pearls may be cleaned from external foulness by washing with a little Venice soap and warm water, or ground rice and salt, with starch and powder blue, with plaister of Paris, with white coral, with sulphat of zinc and tartar, with cuttle bone, pumice-stone, and other similar substances. But it is not practicable to take out a stain which reaches deep into the substance of the pearl. Nor can a number of small pearls be united, as some pretend, into a mass similar to an entire natural one.

Successful attempts have nevertheless been made to form artificial compositions, greatly resembling natural pearls. Reaumur has given a paper on this subject, in the Memoirs of the French Academy for 1716. The ingredient for giving the colour is a fine, silver-like substance, found upon the under-side of the scales of several fish. The scales, taken off in the usual manner, are washed and rubbed in several clean waters, and the liquors allowed to settle. The water being then poured off, the pearly matter remains at the bottom, of the consistence of oil, called by the French *essence d'orient*. A little of this is dropped into a hollow bead of blueish glass, and shaken about so as to line the internal surface; after which, the cavity is filled with wax, to give solidity and weight. By this and other contrivances the pearl is now imitated with great success.

It is said, that the appearance of pearls changes in time.

Aleppo is the staple place of East Indian pearls; and thence they are transported to Leghorn, and circulated through Europe.

PEARL, *Mother of*. See MOTHER OF PEARL.

PEARL-SEED, or SEED PEARL, (GER. *Perlsaamen, Saamenperlen*. DU. *Paarlzaad, Paerelgruis*. DA. *Pertsæd*. SW. *Pärlfrö, Pärlgrus*. FR. *Semence de perle*. IT. *Seme di perle*. SP. *Aljofar, Rostrillo*. PORT. *Aljofar, Aljofra*.) the smallest kind of pearls. See PEARLS.

PEASE, (GER. *Erbsen*. DU. *Eruten*. DA. *Ærter*. SW. *Arter*. FR. *Pois*. IT. *Piselli, Bisi, Erbione*. SP. *Pesoles, Guisantes*. PORT. *Hervilhas, Ervilhas*. RUS. *Goroch*. POL. *Groch*. LAT. *Pisa*.) a kind of pulse, almost universally known; they are of several sorts, as white, yellow, green, and grey. They are also divided into boiling, and hog, pease. The former kind is

proper for the nourishment of man, and particularly serviceable as sea-provision. Vast quantities of yellow split pease are exported from this country to Ireland, where they are employed as an article of food, being made into soup; and it is well known, that when wheat is at a high price, great quantities of white pease are ground down with that grain, and sold for wheat flour, especially in the metropolis. It does very well for bread, but will not make pastry good.

PEBBLE, *Scotch*, a beautiful species of pebble, whose cast is generally blueish, occasionally marked with broad transverse lines, of a purplish, reddish, or brownish hue, and not unfrequently with all these colours. It is extremely hard, and is employed by lapidaries in the formation of seals. It is principally brought from Montrose and Arbroath, on the east coast of Scotland, though specimens of it are sometimes to be met with in different parts of England.

PECK, a dry measure for grain, pulse, and the like. The standard or Winchester peck contains two gallons, each gallon weighing eight pounds troy; four pecks make a bushel, four bushels a coomb or carnock. The peck measures 557.6 solid inches. There are also local pecks, containing some more, some less; for instance, the Lancaster peck contains six gallons, &c.

PECKA, or PESSA, or, as it is written by some, PESEES, is a small copper money, current in many places of India, especially in the maritime provinces, and more particularly in the kingdom of Guzurate. Twenty-six peckas make one mamoudi, and fifty-four a rupee, so that the pecka is worth 2*d*. In those parts of India where certain small shells are current, fifty or sixty of them are given for the pecka; and where the Caramania almonds pass for small money, forty or forty-four of them.

PEDALS, those stops in an organ which govern the large pipes of the instrument, and are managed with the foot; whence the designation pedals, from the Latin *pedales*.

PEDERERO, or PATERARO, a small cannon managed by a swivel. This species of ordnance was formerly much in use among the Spaniards.

PEDLAR, an itinerant dealer in small wares. See HAWKER.

PEDOMETER, from the *Latin*, or *Podometer*, as it is sometimes called, from the *Greek*, is a mechanical instrument, in form of a watch, consisting of various wheels and teeth, which, by means of a chain or string, fastened to a man's foot, or to the wheel of a chariot, advance a notch each step, or each revolution of the wheel, by which it numbers the paces or revolutions, and so the distance from one place to another.

PEEL, a broad thin board, with a long handle, used by bakers to put their bread in and out of the oven.

PEKOE, a species of Bohea tea, known by the small white flowers that are mixed with it. See TEA.

PELICAN, in chemistry, a kind of double glass vessel, used in distilling liquors by circulation; it consists of a cucurbit, and an alembic head, with two tubes bending into the cucurbit again.

PELTMONGER, a dealer in hides and skins. See FURRIER, and FELL-MONGER.

PEN, (*GER. Schreibfedern. DU. Pennen. DA. Penne. SW. Pennor. FR. Plumes à écrire. IT. Penna da scrivere. SP. Plumas de canones para escribir. PORT. Pennas ou canos para escrever. RUS. Pera Stwoli. POL. Piora, Pipy, Pipki*.) an instrument for writing, derived from the Latin word *penna*, signifying a feather; and generally, indeed, they are made of the quills of swans, geese, ravens, and other birds. But there are also, in imitation of these, pens made of gold, silver, and steel. Of these gold are the best, for the silver are of too soft and malleable a texture to wear well, and the steel not only cut the paper, by their excessive hardness, but are subject to rust. We have a great importation of quills from Hamburg. The Dutch quills are passed through hot ashes, to take off the fat and gross particles, and render them transparent. The best of these, generally called *crow quills*, are, in fact, the wing-feathers of ravens, and come principally from Russia. Pens have much declined in quality of late years, supposed to arise from the long interruption to the trade of Hamburg, having exhausted the stock of old quills, and compelled the use of those which have not been dried and hardened by age.

PENALTY, a forfeiture inflicted for disobedience to the regulations of certain acts of parliament, or for the commission of particular crimes. A penalty also is usually annexed to secure payment of money, the performance of certain covenants in a deed, articles of co-partnership, &c. &c. &c.

According to the first-mentioned of these constructions, it is generally a punishment inflicted for the commission of some public offence; and to be imposed after the verdict of a jury, or the conviction of a magistrate, under the specific provisions of the statute annexing the penalty. In the latter, it is generally the pecuniary forfeiture for the omission of some private obligation, and is to be recovered by some ordinary process of law or equity, which it is not within our limits, or our purpose, to distinguish, or describe.

PENGUIN, a fruit very common in the West Indies, of a sharp, acid flavour.

PENCILS, *Camels'-hair*, (*GER. Pinsel. DU. Pinseelen. DA. Pensler. SW. Penslar. FR. Pinceaux. IT. Pennelli. SP. Pinceles. PORT. Pinceis. RUS. Kisri, Kisthi. POL. Pezle*.) those small brushes composed of a

little wooden handle, to which is affixed a piece of quill, furnished at one end with a tuft of camels' hair, or the fur of some other animal. Although all the pencils used in painting in water-colours are called camels'-hair pencils, it rarely happens that the valuable hair of the camel is employed in their formation, that of the mole, &c. being generally used as a substitute. To choose drawing pencils, moisten them a little, and if they come to a point without splitting, they are good. The brushes used by the Chinese, made of a white hair fitted up in reeds, are very excellent for drawing, being much superior, for landscapes, and many other purposes, to our camels'-hair pencils, as they are more elastic. They are not common at London, but they may sometimes be met with.

PENCILS, *Black-lead*, (GER. *Bleylefderne*. FR. *Crayons noirs en bois*. IT. *Piommini in tocco*, *Matite piombine o nere*. SP. *Plumas de lapiz*, *Plomadas*. POL. *Ołowki*.) are made of a mineral substance called plumbago, or black-lead, which is carburet of iron. They are of various qualities, the best are without any grit, not too soft, and that cut easily without breaking. An inferior kind is made by forming a composition of the dust of black-lead with gum or glue, which is fitted into sticks in the same manner as the best: these are always gritty, but are sufficient for the work in which they are employed, being used principally by joiners, &c. to mark their work with. See **BLACK-LEAD PENCILS**.

PENCILS, *Red-lead*, (GER. *Rothelstifte*, *Rothe bleylefderne*. DU. *Roodkrytpennen*. DA. *Rødkridpenne*. SW. *Rödskritspennor*. FR. *Crayons rouges*. IT. *Matite rosse*. SP. *Lapis colorado*. PORT. *Lapis vermelho*. RUS. *Krasnie karandaschi*.) are made of minium, or red lead, in the same manner as the inferior kind of black-lead pencils are. They are used in drawing, to sketch outlines, and in crayon-painting as a red colour. See **MINIUM**.

PENDANT. See **EAR-RING**.

PENDANTS of a ship, those streamers or long colours, which are split or divided into two parts, ending in points, and hung at the heads of masts, or at the yard-arm ends.

PENDULUM, in mechanics, any heavy body, so suspended as that it may swing backwards and forwards, about some fixed point, by the force of gravity.

These alternate ascents and descents of the pendulum, are called its oscillations, or vibrations; each complete oscillation being the descent from the highest point on one side, down to the lowest point of the arch, and so on, up to the highest point on the other side. The point round which the pendulum moves, or vibrates, is called its centre of motion, or point of suspension; and a right line drawn through the centre of

motion, parallel to the horizon, and perpendicular to the plane in which the pendulum moves, is called the axis of oscillation. There is also a certain point within every pendulum, into which, if all the matter that compose the pendulum were collected, or condensed as into a point, the times in which the vibrations would be performed, would not be altered by such condensation; and this point is called the centre of oscillation. The length of the pendulum is usually estimated by the distance of this point below the centre of motion; being always near the bottom of the pendulum; but in a cylinder, or any other uniform prism or rod, it is at the distance of one-third from the bottom, or two-thirds from and below the centre of motion.

The length of a pendulum, so measured to its centre of oscillation, that it will perform each vibration in a second of time, thence called the second's pendulum, has, in the latitude of London, been generally taken at $39\frac{2}{10}$ or $39\frac{1}{5}$ inches; but by some very ingenious and accurate experiments, the late celebrated Mr. George Graham found the true length to be $39\frac{1.28}{10.00}$ inches, or $39\frac{1}{5}$ inches very nearly.

The length of the pendulum vibrating seconds at Paris, was found by Varin, Des Hays, De Glos, and Godin to be $440\frac{1}{2}$ lines; by Picard $440\frac{1}{2}$ lines; and by Mairan $440\frac{1}{30}$ lines.

PENDULUM, *Simple*, in mechanics, an expression commonly used among artists to distinguish such pendulums as have no provision for correcting the effects of heat and cold, from those that have such provision. Also simple pendulum, and detached pendulum, are terms sometimes used to denote such pendulums as are not connected with any clock, or clockwork.

PENDULUM, *Compound*, in mechanics, is a pendulum whose rod is composed of two or more wires or bars of metal. These, by undergoing different degrees of expansion, and contraction, when exposed to the same heat, or cold, have the difference of expansion, or contraction, made to act in such a manner as to preserve constantly the same distance between the point of expansion, and centre of oscillation, though exposed to very different, and various, degrees of heat, or cold. There are a great variety of constructions for this purpose.

It may be just observed by the way, that the vulgar method of remedying the inconvenience arising from the extension, and contraction, of the rods of common pendulums, is by supplying the bob, or small ball, with a screw at the lower end; by which means the pendulum is at any time made longer, or shorter, as the ball is screwed downwards, or upwards, and thus the time of its vibration is regulated.

The *gridiron pendulum* was the invention of Mr. John Harrison, a very ingenious

artist, and celebrated for his invention of the watch for finding the difference of longitude at sea, about the year 1725, and of several other timekeepers and watches since that time; for all which he received the parliamentary reward of between 20,000 and 30,000 pounds. It consists of five rods of steel, and four of brass, placed in alternate order, the middle rod being of steel, by which the pendulum-ball is suspended; these rods of brass, and steel, thus placed, are so connected with each other at their ends, that while the expansion of the steel rods has a tendency to lengthen the pendulum, the expansion of the brass rods, acting upwards, tends to shorten it. And thus, when the length of the brass, and steel, rods is duly proportioned, their expansions, and contractions, will exactly balance and correct each other, and so preserve the pendulum invariably of the same length. The simplicity of this ingenious contrivance is in its favour; but the difficulty of adjustment seems an objection.

Mr. Harrison, in his first machine for measuring time at sea, applied this combination of wires of brass and steel, to prevent any alterations by heat or cold; and in the machines or clocks he has made for this purpose, a like method of guarding against the irregularities arising from this cause, is used.

The *mercurial pendulum* was the invention of Mr. Graham, in consequence of several experiments relating to the materials of which pendulums might be formed, in 1715. Its rod is made of brass, and branched towards its lower end, so as to embrace a cylindric glass vessel 15 or 14 inches long, and about two inches diameter; which being filled about twelve inches deep with mercury, forms the weight or ball of the pendulum. If, upon trial, the expansion of the rod is found too great for that of the mercury, more mercury must be poured into the vessel; if the expansion of the mercury exceeds that of the rod, so as to occasion the clock to go fast with heat, some mercury must be taken out of the vessel, so as to shorten the column. And thus may the expansion and contraction of the quicksilver in the glass be made exactly to balance the expansion, and contraction, of the pendulum-rod, so as to preserve the distance of the centre of oscillation from the point of suspension invariably the same.

Mr. Graham made a clock of this sort, and compared it with one of the best of the common sort, for three years together; when he found the errors of his own but about one-eighth part of those of the latter.

Mr. John Ellicott also, in the year 1738, constructed a pendulum on the same principle, but differing from Mr. Graham's in many particulars. The rod of Mr. Ellicott's pendulum was composed of two bars only; the one of brass, and the other of steel. It

had two levers, each sustaining its half of the ball or weight; with a spring under the lower part of the ball to relieve the levers from a considerable part of its weight, and so to render their motion more smooth and easy. The one lever in Mr. Graham's construction was above the ball; whereas both the levers in Mr. Ellicott's were within the ball, and each lever had an adjusting screw, to lengthen or shorten the lever, so as to render the adjustment the more perfect.

Notwithstanding the great ingenuity displayed by these very eminent artists on this construction, it must farther be observed, in the history of improvements of this nature, that Mr. Cumming, another eminent artist, has given, in his *Essays on the Principles of Clock and Watch Work*, an ample description, with plates, of a construction of a pendulum with levers, intended to unite the properties of Mr. Graham's and Mr. Ellicott's, without being liable to any of the defects of either. The rod of this pendulum is composed of one flat bar of brass, and two of steel; he uses three levers within the ball of the pendulum; and, among many other ingenious contrivances for the more accurate adjusting of this pendulum to mean time, it is provided with a small ball and screw, below the principal ball or weight, one entire revolution of which on its screw will only alter the rate of the clock's going one second per day; and its circumference is divided into 30, one of which divisions will therefore alter its rate of going one second in a month.

In 1790, a projected improvement on Graham's mercurial pendulum was offered by Mr. Edward Troughton.

In 1794, Dr. Fordyce produced an improvement, under the description of "Compensation of the simple pendulum."

In 1804, Troughton invented a *tubular pendulum* composed of different metals.

In 1806, Mr. Henry Ward's compensation pendulum obtained a reward from the Society of Arts.

In 1809, Mr. Adam Reid's compensation pendulum obtained a similar encouragement from the same society.

In 1811, Mr. Thomas Doughty's compensation pendulum was produced.

In 1812, Mr. David Ritchie presented a new compensation pendulum to the Society of Arts, from which body he also received a reward for his ingenuity.

And, more recently, Mr. Hardy has brought forward a new compensation pendulum, which promises to unite all the merits of those before invented, without their defects, inconveniences, or irregularities. Besides these, which, it will be observed, do so much credit to the talents of our countrymen, various other inventions for similar purposes have been produced by foreigners, which our limits (already exceeded) forbid us further to notice.

PENDULUM-CLOCK is a clock having its motion regulated by the vibration of a pendulum.

It is controverted between Galileo, and Huygens, which of the two first applied the pendulum to a clock.

After Huygens had discovered that the vibration made in arcs of a cycloid, however unequal they might be in extent, were all equal in time; he soon perceived that a pendulum applied to a clock, so as to make it describe arcs of a cycloid, would rectify the otherwise unavoidable irregularities of the motion of the clock; since, though the several causes of those irregularities should occasion the pendulum to make greater or smaller vibrations, yet, by virtue of the cycloid, it would still make them perfectly equal in point of time: and the motion of the clock governed by it, would therefore be preserved perfectly equable. But the difficulty was, how to make the pendulum describe arcs of a cycloid: for naturally the pendulum, being tied to a fixed point, can only describe circular arcs about it.

Here Mr. Huygens contrived to fix the iron rod or wire which bears the ball or weight at the top, to a silken thread, placed between two cycloidal cheeks, or two little arcs of a cycloid, made of metal. Hence the motion of vibration, applying successively from one of those arcs to the other, the thread, which is extremely flexible, easily assumes the figure of them, and by that means causes the ball or weight at the bottom to describe a just cycloidal arc.

This is doubtless one of the most ingenious and useful inventions many ages have produced: by means of which, it has been asserted, there have been clocks that would not vary a single second in several days; and the same invention also gave rise to the whole doctrine of involute, and evolute, curves, with the radius and degree of curvature, &c.

It is true, the pendulum is still liable to its irregularities, how minute soever they may be. The silken thread by which it was suspended, shortens in moist weather, and lengthens in dry; by which means the length of the whole pendulum, and consequently the times of the vibrations, are somewhat varied.

To obviate this inconvenience, M. de la Hire, instead of a silken thread, used a little fine spring; which was not indeed subject to shorten and lengthen from those causes; yet he found it grew stiffer in cold weather, and then made its vibrations faster than in warm: to which also we may add its expansion, and contraction, by heat, and cold. He therefore had recourse to a stiff wire or rod, firm from one end to the other. Indeed, by this substitute he renounced the advantages of the cycloid; but he found, as he says, by experience, that the vibrations in circular arcs are performed in times as equal,

provided they are not of too great extent, as those in cycloids. But the experiments of Sir Jonas Moore, and others, have demonstrated the contrary.

The ordinary causes of the irregularities of pendulums, Dr. Derham ascribes to the alterations in the gravity and temperature of the air, which increase, and diminish, the weight of the ball, and by those means make the vibrations greater, and less: an accession of weight in the ball being found by experiment to accelerate the motion of the pendulum; for a weight of six pounds added to the ball, Dr. Derham found, made his clock gain thirteen seconds every day.

A general remedy against the inconveniences of pendulums, is to make them long, the ball heavy, and to vibrate but in small arcs. These are the usual means employed in England; the cycloidal cheeks being generally neglected.

Pendulum-clocks resting against the same rail have been found to influence each other's motion. See the *Philos. Trans. Numb. 455, sects. 5, and 6, where Mr. Ellicott has given a curious and exact account of this phenomenon.*

PENDULUM, Royal, a name given to a clock, whose pendulum swings seconds, and goes eight days without winding up; showing the hour, minute, and second.

PENKNIVES, (GER. *Federmesser*. DU. *Pennemessen*. DA. *Pennëknive*. SW. *Penknifvar*. FR. *Canifs*, *Canivets*. IT. *Temperini*. SP. *Corta plumas*. PORT. *Canivetes*. RUS. *Perotchinnoi noshkoi*. POL. *Szczyzorki*.) small knives; too well known to need any particular description, used in making and mending pens. Those penknives which are made from the blades of old razors are accounted the best. The most excellent and the most highly-ornamented penknives are manufactured at London and Sheffield.

PENNANTS. See **PENDANTS**.

PENNINGEN, a copper money of the Netherlands, value $\frac{1}{160}$ d. sterling. Also a Dutch money of account, equivalent to $5\frac{2}{3}\frac{1}{2}$ l. sterling.

PENNY, formerly a silver, but now a copper, coin.

The penny was the first silver coin struck in England by our Saxon ancestors, being the 240th part of their pound, and its true weight was about 22 $\frac{1}{2}$ grains troy.

PENNYWEIGHT, a troy weight, being the twentieth part of an ounce, containing 24 grains; each grain supposed to weigh a grain of wheat gathered out of the middle of the ear, well dried. The name took its rise from its being actually the weight of one of our ancient silver pennies.

PEPPER, (GER. *Pfeffer*. DU. *Peper*. DA. *Peber*. SW. *Peppar*. FR. *Poivre*. IT. *Pepe*, *Pevere*. SP. *Pimienta*. PORT. *Pimenta*. RUS. *Perez*. POL. *Pieprz*. LAT. *Piper*.) an aromatic berry, of a hot, dry quality, chiefly used in seasoning articles of

food. There are three kinds of pepper at present used in the shops, viz. the black, the white, and the long pepper. The black pepper is the fruit of the *piper scriboea*. This is a shrub whose root is small, fibrous, and flexible; it rises into a stem, which requires a tree, or prop, to support it. Its wood has the same sort of knots as the vine; and when it is dry, it exactly resembles the vine-branch. The leaves, which have a strong smell, and a pungent taste, are of an oval shape; but they diminish towards the extremity, and terminate in a point. From the flower-buds, which are white, and are sometimes placed in the middle, and sometimes at the extremity of the branches, are produced small berries, resembling those of the currant. Each of these contains between twenty and thirty corns of pepper; they are commonly gathered in October, and exposed to the sun seven or eight days. The fruit, which was green at first, and afterwards red, when stripped of its covering, assumes the appearance it has when we see it. The largest, heaviest, and least shrivelled is the best. The pepper-plant flourishes in the islands of Java, Sumatra, and Ceylon, and more particularly on the Malabar coast. It is not sown, but planted; and great nicety is required in the choice of the shoots. It produces no fruit till the end of three years; but bears so plentifully the three succeeding years, that some plants yield between six and seven pounds of pepper. The bark then begins to shrink: and the shrub declines so fast, that in twelve years time it ceases bearing.

The common *white pepper* is mostly factitious, being prepared from the black in the following manner; they steep this in sea-water, exposed to the heat of the sun several days, till the rind or outer bark loosens; they then take it out, and when it is half dry, rub it till the rind falls off; then they dry the white fruit, and the remains of the rind blow off like chaff. A great deal of the heat of the pepper is taken off by this process, so that the white kind is more fit for many purposes, than the black. There is, however, a sort of native white pepper produced on a species of the same plant, which is much better than the factitious. The *long pepper* is a dried fruit, of an inch or an inch and a half long, and about the thickness of a large goose-quill: it is of a brownish-grey colour, cylindrical in figure, and said to be produced on a plant of the same genus, as that which yields the black pepper.

The *piper amalga*, or black pepper, and the *piper inequale*, or long pepper of Jamaica, are indigenous. The whole plant of the former has the exact taste of the East India black pepper; the fruit of the latter is similar to the East India long pepper.

The people of the East Indies esteem pepper a stomachic, and drink a strong infusion of it in water, by way of creating an

appetite. They have also a method of making a fiery spirit of fermented fresh pepper, with water, which they use for the same purposes. To preserve both the long, and black, pepper, the fruit may be slightly scalded when green, then dried, and wrapped in paper. Pepper that is sold ground, is very apt to be sophisticated; the black with burnt crusts of bread, &c. and the white with pounded rice.

The black pepper of the East Indies contains an essential oil, which has a strong and durable smell, and a taste the mildest of all essential oils. This oil is partly elevated in distillation by alcohol, which thereby acquires the flavour, but none of the pungency of the pepper. The spirituous extract is excessively fiery. The watery extract is also very hot and biting. Neither this menstruum, nor the spirit, can, singly, extract all the hot matter of the pepper.

On distilling the tincture, the alcohol comes over colourless; but toward the end, the liquor in the retort becomes muddy, and deposits a greenish matter, which may be observed likewise trickling down the sides of the receiver like oil. This is the substance to which pepper is indebted for its taste and smell, and in its properties it is analogous to the volatile oils.

Pepper likewise contains a peculiar extractive matter, which seems to reside in the outer coat; and a species of starch. The outer coat has the flavour, but little of the heat, of pepper.

Pepper is always imported in bags, and London is the grand staple of the commodity.

PEPPER, *Guinea*, the red pod of the *capsicum annuum*. A species of it, called in the West India islands bird-pepper, is the basis of the powder used by the name of *Cayenne pepper*. See CAYAN.

PEPPER, *Jamaica*. See PIMENTO.

PERAMBULATOR, in surveying, an instrument for measuring distances, called also pedometer and surveying wheel. See PEDOMETER.

PERCENTAGE is a word generally used to signify an allowance of a certain sum on every hundred pounds, for the labour of receiving money. It is commission money, reduced to a specific sum.

PERCH, in land-measuring, a rod or pole of $16\frac{1}{2}$ feet in length, of which 40 in length, and 4 in breadth, make an acre of ground. But by the customs of several counties there are differences in this measure. In Staffordshire it is 24 feet; and in the forest of Sherwood 25 feet, the foot being there 18 inches long; and in Herefordshire a perch of ditching is 21 feet, the perch of walling $16\frac{1}{2}$ feet, and a pole of denshiere ground is 12 feet, &c.

PERFUME is a fragrant odour, operating directly upon the olfactory nerve, or sense of smelling. Perfumes are divided

into natural, and artificial. The preparation and preservation of the former, and the composition of the latter, with the admixture and adhibition of both, form the business and profession of the perfumer. The natural perfumes in use, are chiefly musk, ambergris, civet, cedar-wood, cloves, cinnamon, and some other spices. The artificial are generally produced by the distillation of certain odoriferous plants, as rose, lavender, orange-flowers, jasmine, thyme, &c. &c.; which are again varied by the infusion of portions of the natural perfumes. The French are supposed to excel us particularly in the composition and delicacy of their perfumes. They form no inconsiderable source of traffic.

PERILS OF THE SEA. It may, in general, be said that every thing happening to a ship, in the course of her voyage, by the immediate act of God, without the intervention of human agency, is a peril of the sea. Thus every accident happening by the violence of the winds and waves, by thunder or lightning, by driving against rocks, by the stranding of the ship, or by any other violence which human prudence could not foresee, nor human strength resist, may be considered as a loss within the meaning of a policy of insurance, and the assurer must answer for all damages sustained in consequence of such accident. But if a ship be driven by stress of weather on an enemy's coast, and is there captured, it is a loss by capture, and not by perils of the sea. *Green v. Elmsley, Peake, 212.*

In order to charge the underwriter for a loss by perils of the sea, the ship must be equipped with every thing necessary for the voyage; she must be sea-worthy, have a sufficient crew, and a captain and pilot of competent skill. And, therefore, when a ship homeward-bound from Stettin to London, received on board a pilot from Orfordness, but dropped him at half-way reach, in the river Thames, before she had reached her moorings higher up in the river, and an accident afterwards happening, by which the ship was lost, the underwriter on the ship and cargo was holden discharged from his liability, on account of there not being any pilot on board at that time, although it did not appear, that the loss was directly imputable to the want of skill in those that navigated her. *Law v. Hollingsworth, 7 Term Rep. 160.*

In the case of *Rohl v. Parr*, the ship had been destroyed by a species of worms which infest the rivers of Africa; and an intelligent merchant swore, that he had known many instances of this species of loss, but that the underwriters had invariably refused to pay. Lord Kenyon and the jury, upon this evidence, decided, that this was *not* a loss by perils of the sea. *Sittings of Hilary, 1796.*

And even in an action on a policy, in which there was a warranty against captures

and seizures, (the ship never having been heard of after sailing) it was insisted for the defendant, that as captures and seizures were excepted, it lay upon the plaintiff to prove, that the loss happened in the particular manner stated. Lord Chief Justice Lee said, it would be unreasonable to expect certain evidence of such a loss, where every body on board is presumed to be drowned, and all that can be required is, the best proof the nature of the case admits of, which the plaintiff has given. The jury found a verdict for the plaintiff. *Green v. Brown, 2 Stra. 1199.*

A ship was insured for three months, and three days *before* the expiration of the time, she received her death-wound, but was kept afloat by pumping till three days *after*; the underwriter was held discharged. *Mentony v. Dunlop, 1 T. R. 260.*

If a ship, hove down on a beach within the tide-way to repair, be thereby bilged and damaged, it is not a loss occasioned by the perils of the sea. *Thompson v. Whitmore, 3 Taunt. 227.*

But a loss occasioned by another ship running down the ship insured, through gross negligence, is a loss by peril of the sea. *Smith v. Scott, 4 Taunt. 126.*

A practice prevails amongst assurers, that the ship shall be deemed lost, if not heard of in six months after her departure, (or after the time of the last intelligence from her,) for any port in Europe, and in twelve months, if for a greater distance. If, under this usage, the assurer should pay the money, supposing the ship lost, when it really is not, he may recover it back by action.

PERJURY, is a wilful false oath by a person, who being lawfully required to depose the truth in any judicial proceeding, swears absolutely in any manner material to the point in issue.

To constitute the offence of perjury, the false oath must be wilful, or with some degree of deliberation; but it is not material whether the fact be true, or false, where the person swearing knows nothing about it.

No oath taken before persons acting merely in a private capacity, or before those who take upon themselves to administer oaths of a public nature without legal authority, or before those who are legally authorised to administer some kind of oaths, can amount to perjury.

It is further necessary that the oath be taken in some judicial proceeding, as well as material to the point in issue.

The punishment of perjury is, by statute, six months imprisonment, perpetual infamy, and a fine of 20*l.*, or, not paying the same, to have both ears nailed to the pillory; but the prosecution is generally carried on at the common law by indictment at the assizes, or in the court of king's bench; as by this mode, exclusive of the penalties attached by the statute, the offender may be

committed to the house of correction, or transported for seven years. 9 Geo. 2. c. 18.

PERMIT, a license from the excise, for persons to remove exciseable articles, denoting that the duties have been paid. *See* EXCISE.

PERNAMBUCCO - WOOD. *See* BRASIL-WOOD.

PERPETUITY, in annuities, the number of years' purchase to be given for an annuity which is to continue for ever. It is found by dividing 100*l.* by the rate of interest, and, consequently is, at the most usual rates, as follows:

at $\frac{3}{4}$ per cent.	33,3333
$\frac{3}{2}$	28,5714
4	25,0000
$4\frac{1}{2}$	22,2222
5	20,0000
6	16,6666
7	14,2857

These are the number of years' purchase to be given for a perpetual annuity, on the supposition that it is receivable yearly: but as annuities are much more commonly received half-yearly, and the interest of money is likewise usually paid half-yearly, the perpetuity, under these circumstances, will be greater or less than the above, as the periods at which the annuity is payable, are more, or less, frequent than those, at which the rate of interest is payable. Example at 4 per cent. interest.

Interest payable.	Annuity Yearly.	Payable Half-yearly.
Yearly	25,000,000	25,247,548
Half-yearly	24,752,475	25,000,000
Quarterly	24,628,109	24,875,621

PERRY, a beverage made from pears, in the same manner as cyder is from apples. *See* CYDER.

PERSIAN, the name of a thin, inferior kind of silken stuff, which is principally employed in lining the garments of females.

PERSIAN - WHEEL, an engine or wheel, turned by a rivulet, or other stream of water, and fitted with open boxes at its cogs, to raise water for the overflowing of lands, or other purposes. It may be made of any size, according to the height the water is to be raised to, and the strength of the stream by which it is turned. This wheel is placed so that its bottom only is immersed in the stream, wherein the open boxes at its cogs are all filled one after another with water, which is raised with them to the upper part of the wheel's circuit, and then naturally empties itself into a trough which carries it to the land.

PERSONAL, being joined with the substantives, things, goods, or chattels, as things personal, goods personal, chattels personal, signifies any moveable thing belonging to a man, be it quick or dead.

PERSONATE, is the representing a person by a fictitious or assumed character, so as to pass for the person represented. Personating bail, in a recognizance before a magistrate, is a misdemeanor indictable at common law, and punishable by fine and imprisonment; in a court of justice it is made by stat. 21 Jac. 1. c. 26. a capital felony. By various other statutes, personating seamen entitled to wages, prize-money, &c. is also a capital felony.

PERU BALSAM. (*GER.* *Peruanischer Balsam.* *FR.* *Beaume de Perou.* *IT.* and *SP.* *Balsamo del Peru.* *PORT.* *Balsamo Peruviano.* *LAT.* *Balsamus Peruvianus seu Indicus.*) *See* BALSAM.

PERUVIAN-BARK. *See* CHINA and JESUITS' BARK.

PETALITE, a mineral which is mentioned by Dandrade, and is but little known. It is of a reddish colour, of a laminated fracture; fragile, but sufficiently hard to scratch glass. It is found at Uton, Salha, and Fingrufan, near Niakoparberg in Sweden.

PETARD, a piece of ordnance made of metal in the shape of a truncated cone, used for breaking down gates, bridges, barriers, &c.

PETITION. No petition to the king, or to either house of parliament, for any alteration in church or state, shall be signed by above twenty persons, unless the matter thereof is approved by three justices of the peace, or the major part of the grand jury of the county; and in London, by the lord mayor, aldermen, and common council: nor shall any petition be presented by more than ten persons at a time. Any petition to the houses of parliament, not weighing more than six ounces, shall be received by any member of the same, postage free, if in a case left open at the ends. 54 Geo. 3. c. 169.

PETITION IN CHANCERY, a request in writing, directed to the Lord Chancellor, or Master of the Rolls, showing some matter or cause, whereupon the petitioner proves somewhat to be granted to him. They are also frequently presented to the Barons of the Exchequer, for the remission of penalties under the laws of excise. Not unfrequently to the commissioners of excise and customs, for purposes somewhat similar.

PETRIFICATION, denotes the conversion of wood, bones, and other substances, principally animal or vegetable, into stone.

The petrifications which are found about Matlock, and in other parts of Derbyshire, are converted by the inhabitants into vases, busts, boxes, and various ornaments for chimney-pieces, &c. some of them being so admirably polished, that they bear a near resemblance to jasper. Abundance of these articles is sold in London, and most of the populous cities and towns of Great Britain and Ireland, and have recently become an article of export to other countries, where they are held in high esteem.

PETROL, or **PETROLEUM**, (GER. *Steinöl*, *Bergöl*. DU. *Steenöl*. DA. *Steenolje*. SW. *Stenolja*. FR. *Petrole*. IT. *Petroleo*, *Olio di Sasso*. SP. and PORT. *Petroleo*. RUS. *Kamennoe masslo*. POL. *Skalny olej*. LAT. *Petroleum*.) likewise denominated *oil of Petre*, and *Rock-oil*, is a mineral oil, or species of bitumen, supposed to issue out of the clefts of rocks, and found floating on the waters of certain springs. It differs from ordinary bitumens, only from its being liquid, like asphaltum, jet, &c. Petrol is either reddish, brown, greenish, or blackish, and is often found issuing from the earth of the latter hue. Hitherto there has been but little of this article found, except in hot countries, such as Persia, the southern provinces of France, and the duchy of Modena, in Italy. It is insoluble in alcohol, and, according to some chemists, consists of naphtha, thickened by exposure to the atmosphere. It contains a portion of succinic acid. There is a sort of petrol brought from Barbadoes, under the name of *pissee-læum Indicum*, or Barbadoes tar; this is of a reddish-black colour, of a disagreeable smell, and of the consistence of common tar.

Petrol is principally used externally in paralytic cases, and in pains of the limbs. The French give it internally in hysterical complaints, and to their children against worms.

PEWTER, (GER. *Zinn*, *Zinngeisser-zinn*. DU. and DA. *Tin*. SW. *Tenn*. FR. *Etain*. IT. *Stagno*, *Peltro*. SP. *Estano*. PORT. *Estanho*. RUS. *Olowo*. POL. *Cyna*.) a factitious metal used in making plates, dishes, and other domestic utensils. It is a compound metal, the basis of which is tin. The best sort consists of tin alloyed with about a twentieth or less of copper, or other metallic bodies, as the experience of the workmen has shown to be the most conducive to the improvement of its hardness and colour, such as lead, zinc, bismuth, and antimony.

There are three sorts of pewter, distinguished by the names of plate, trifle, and ley-pewter. The first was formerly much used for plates and dishes; of the second are made the pints, quarts, and other measures of beer; and of the ley-pewter wine measures, and large vessels.

The best sort of pewter consists of 17 parts of antimony to 100 parts of tin; but the French add a little copper to this kind of pewter. A very fine silver-looking metal is composed of 100 pounds of tin, eight of antimony, one of bismuth, and four of copper. On the contrary, the ley-pewter, by comparing its specific gravity with those of the mixtures of tin and lead, must contain more than a fifth part of its weight of lead. This quantity of lead is far too much, considering some of the uses this sort of pewter is applied to; for acid wines will readily

corrode the lead of the flagons, in which they are measured, into acetat of lead; which, being taken internally, is productive of various chronic diseases.

Foreigners generally assert, that English tin is always a mixed metal when exported abroad; and the French Encyclopedists in particular inform us, that the English tin, when cast into moulds of six inches in thickness, and cooled, if it be divided into three layers, the uppermost has three pounds of copper in the 100 of tin; the second layer has five pounds of lead in the same quantity of tin; and the lowest layer has nine pounds of lead in the 100 of tin. But there is no foundation for such an assertion, but that pewter has been mistaken for tin abroad; and, in fact, all pewter pieces are called by the name of *tin ware* all over Europe, except in England.

No less than four statutes were passed in the single reign of Henry VIII., relative to the true making of pewter; but they are all either obsolete or repealed, except 4 Hen. 8, c. 7. by which statute the master and wardens of the craft of pewterers, or the head officer of every corporate town, may search for defective pewter; and if such be found, the person putting it to sale shall forfeit the same, half to the king, and half to the searcher.

PEZZA, a money of exchange in use among the Italians, value about 4s. 2d. sterling. This is sometimes called the Italian dollar of exchange.

PFENNING, or **FENNING**, a copper coin of Germany, worth $\frac{1}{12}$ d.

PHAROS, in some parts of the world, is a word used to express a light-house.

PHENNIG, a German coin equivalent to $\frac{1}{3}$ d. sterling.

PHIAL, a small bottle, used by apothecaries for holding liquid medicines; and by wine-dealers for exhibiting samples of wine, spirits, &c.

PHLEAM, an instrument for letting blood, generally used by veterinary surgeons and farriers. It is usually placed on the vein, and driven in with a blow.

PHOSPHORUS, a simple substance, much resembling wax in consistence; when pure, it is nearly of the transparency of gum-copal, varying from amber-red to the faintest straw colour, highly combustible, and when oxygenated, producing a strong and peculiar acid.

It was discovered by a German chemist, of the name of Brandt, about 160 years since. The preparation was long kept a secret in the hands of a few persons, but the nature of it, and the mode of preparing it, was at length detected by chemists.

The earliest mode of obtaining it was from human urine; but this disgusting process was abandoned, soon after it was found that the bones of animal bodies contained it in considerable proportion, in the state of

phosphoric, combined with lime. The process for making phosphorus, which is at present generally adopted, consists of two operations;—the separation of the phosphoric acid from the bone-ash, and the distillation of the acid and charcoal, to obtain the phosphorus. The former is effected in the following manner: take any quantity (suppose four lbs.) of powdered bone-ash, or calcined earth of bones; put it into an earthen pan, capable of holding four gallons, mix it at first with about four quarts of water, and then add gradually, with incessant stirring, two lbs. of strong sulphuric acid. A very great heat is excited by the mixture, and some effervescence; then add about a gallon of water, and allow it to remain for a day, with occasional stirring. The mixture thickens by standing; so that if this quantity of water is not sufficient, more must be added, to bring it to the consistence of thick soup. Then pour the whole mixture on a linen bag, by which the clear liquor will run through, and leave the white pulpy mass on the filter, which must be strongly pressed, and then washed with a pint or two of boiling water, to extract all the acid. Unite all the liquors together, and after they have stood a little to become quite clear, they are fit for evaporation. This liquor now contains almost all the phosphoric acid of the bone-ash, chemically united with a portion of undecomposed phosphate of lime, and also holding some sulphate of lime in solution. The white mass in the filter is sulphate of lime, which may be thrown away: the liquor may be either boiled down immediately, or, as Dr. Higgins recommended, first saturated with ammonia, and then evaporated. The former is the usual method; and where the object is only to procure phosphorus, and not pure phosphoric acid, it is probably preferable. The boiling down of this large quantity of acid liquor is tedious. It may be done either in large wedge-wood ware, evaporating pans of charcoal, or in a copper pan, as this acid does not readily act on copper. Keep up a brisk heat, and continue the boiling almost to dryness, during which the clear liquor, as it becomes concentrated, will be muddy, from the separation of selenite, and a greasy looking mass will be deposited on the sides of the vessel. When the liquor is boiled down nearly to dryness, carefully add to it the scrapings from the sides of the vessel, and let it stand some hours, that the selenite may be precipitated; then re-dissolve the whole in as little cold water as will take up all the acid, filter it off from the selenium, and evaporate it till it becomes a puffy pasty mass, which is intensely sour, and consists of phosphoric acid, holding some phosphate of lime; then mix it thoroughly with a fourth part of its weight of powdered charcoal, and dry the whole in any vessel, with a heat just below redness; it is then fit for the subsequent

process of distillation. A very strong red, or red-white heat, is required for this purpose, so that the retort must be of earthenware, and fitted to a powerful reverberatory furnace, or surrounded with burning charcoal, in considerable quantity, and heaped up for some height above its neck. As at this temperature the common crucible ware becomes very porous, much of the vapour of the phosphorus would ooze through, so that the retort should previously be coated with a vitrescent lute, of which there is none better than slacked lime, brought to a moderately thin consistence, by a saturated solution of borax, in water, and brushed over the outside of the retort, and slowly dried. This, when heated, forms a thin glazing, which stops up most of the pores of the vessel. In the distillation the contact of the external air must be carefully excluded, otherwise the phosphorus, as soon as formed, would take fire, and be consumed speedily. This may be prevented by elongating the neck of the retort with another earthen or metal tube, cemented to it by *glue luting* (made with glass of borax, brick-dust, and clay), and dipping the end of the second tube about an inch in a pan of water. Thus all the gaseous products pass through the water, and the phosphorus partly concretes in the tube, and partly falls to the bottom of the water.

The retort being nearly filled with the mixture of charcoal and acid, put it into the furnace, and raise the heat very gradually to a moderate redness. At first, a mixture of gases, chiefly carbonic acid and hydrocarbonate, pass over; and when these have nearly ceased, increase the heat to a full-glowing white-red, and keep it up to this degree during the remainder of the distillation. The first indication of the production of phosphorus is, that the gas, as it passes out of the water, becomes white and luminous in the dusk, which is followed by a gas still more inflammable, each bubble of which takes fire in the air, and burns with a brilliant flame and slight snapping noise, as soon as it rises above the surface of the water. After this the phosphorus rises in substance.

The phosphorus produced in this process is very brown and foul, and is mixed with a good deal of a brown-red powder, which diffuses itself in water, like clay, and consists chiefly of phosphorus, so far oxygenated, as to be no longer combustible. It may be purified by several methods; the simplest is the following: tie it up in a piece of thin white leather, then plunge it into boiling water, and squeeze the bag, by which the melted phosphorus will ooze through in drops, that coalesce at the bottom of the water into a clear pure waxy phosphorus, almost transparent and colourless.

PIASTRE or PIASTER, a Spanish money of account, equivalent to 3s. 7d.

The silver piastre of Spain is current at the same rate. The Turkish piastre, a money of account, is equal to 4s.; the Arabian piastre of account, to 4s. 6d.; the Egyptian piastre of account, to 4s.; and in the Indies and America, the silver piastres or dollars are generally current at 4s. or 4s. 6d.

PIASTRIVE, a silver coin of Spain, value 10 $\frac{3}{4}$ d.

PIASTRO, an Italian gold coin, value 4s. 2d. sterling.

PIC, PICK, or PICOL, the Chinese quintal of one hundred pounds, their weight, or one hundred and twenty-five pounds marc. See CATI.

This weight is also in use at Siam, Malacca, and the islands of Sunda; though at the first of these it consists of double the number of Siamese cati, to what it does of the Chinese; as the former cati is only half of the latter.

PICA, among printers, a particular size of their types or letters. See PRINTING.

PICCAGE, money paid in fairs, to the lord of the manor, for breaking of the ground, to set up booths or stalls.

PICK-AXE, an axe composed of a wooden handle, and an iron head, which has two slightly curved points or prongs, situated on each side of the handle, and forming one piece. The pick-axe is employed in loosening the soil, in picking out pavement, &c. Pick-axes are principally manufactured at Sheffield.

PICKLE, a liquor commonly made of salt, water, or vinegar, &c. and sometimes with the addition of spices, wherein meats, fruits, &c. are preserved and seasoned. It also denotes the fruit, root, &c. pickled therein. The West Indies furnish us with abundance of pickled vegetables.

PICOL. See PIC.

PICTURES. (GER. *Gemälde, Schilder-eyen*. DU. *Schilderjen*. DA. *Malerie, Skilderie*. SW. *Målningar*. FR. *Tableaux*. IT. *Pitture, Quadri*. SP. *Pinturas, Cuadros*. PORT. *Pinturas*. RUS. *Kartinii*. POL. *Nalowania*.) The taste for foreign paintings and pictures having lately surprisingly decreased, our inland trade, in the productions of the English school of painting, has experienced a vast augmentation; and it is even said that great quantities of these articles are sent to, and eagerly bought up, on the continent of Europe. See PAINTING.

PICTURE - FRAMES are square, round, oval, or oblong square, according to the subject to be framed, and the taste of the proprietor. They are usually either gilded or black, or an union of both. They are made of all sorts of wood, but sycamore is now esteemed the best. It is easily carved, and extremely light. Picture-frames used to be a considerable article of export, especially to Russia, but they are prohibited by the last tariff.

PIECE, in commerce, sometimes denotes

a whole, and sometimes only a part of the whole; in a pecuniary sense, it is sometimes the same thing with species, and sometimes it denotes such money as has no other particular name.

PIECE OF EIGHT, RIAL OF EIGHT, or PIASTRE, a silver money, first struck in Spain, afterwards in other countries, and now current almost every where. It is equal to eight silver rials. Its value is nearly the same with the late French crown, or four shillings and sixpence sterling. There are two kinds of this coin; the one struck at Potosi, the other at Mexico; the latter are a little heavier than the former, but not quite so fine. The piece of eight is divided into halves, quarters, half quarters, and sixteenths. The exchange between England and Spain is in pieces of eight.

PIECE, is also a sort of money of account, used among the negroes on the coast of Angola, in Africa.

PIECE Broker. Persons in this trade buy shreds and remnants of cloth from tailors, which they sell again to such as want them for mending, &c.

PIECE Goods, a name given in India to the infinite variety of fabrics of cotton there manufactured, under the names of calicoes, chintzes, muslins, ginghams, taffetas, &c. &c.

PIECE Work, is that sort of work which is done by the piece, or, as it is commonly called "the great." This sort of piece work, in agriculture, is chiefly governed by 20 Geo. 2. c. 19., in the construction of which statute see *Lowther v. Earl of Radnor*, 8 E. R. 113., and 2 Dick. Pract. Expos. 838. In trade and manufactures, by 6 Geo. 3. c. 25. See *R. v. Hoscason*, 14 E. R. 605., and 2 Dick. Pract. Expos. 843.

PIER, the columns on which the arch of a bridge is raised.

PIER, is also used to signify a thick, strong, and well-guarded wall or wharf, usually composed of durable stone, and stretching far into the sea for the convenience of vessels lading and unlading their cargoes, whatever may be the state of the tide.

PIERAGE, money paid by masters of ships for the use of a pier.

PIERCER, a sort of awl, or gimblet, used for giving vent to vessels containing liquids.

PIG. See SWINE.

PIG of lead, the eighth part of a fodder, amounting to about two hundred and fifty pounds weight.

PIKE, an offensive weapon consisting of a shaft of wood, twelve or fourteen feet long, headed with a flat-pointed steel, called the spear.

PILCHARDS, (GER. *Sardellan*. DU. *Sardynen*. DA. *Sardeller*. FR. *Sardines*. IT. *Sardine*. SP. *Sardinas*. PORT. *Sardinhas*. RUS. *Sardetii*. POL. *Sardely*. LAT.

Sardine.) are fish which have a general likeness to the herring, but differ in some particulars very essentially. The body of the pilchard is less compressed than that of the herring, being thicker and rounder: the nose is short in proportion, and turns up; the under jaw is also shorter. The dorsal fin of the pilchard is placed exactly in the centre of gravity; so that when taken up by it, the body preserves an equilibrium; whereas that of the herring dips at the head. Pilchards, in general, are less than the herring, but are fatter or fuller of oil. Their winter retreat, and their motives for migrating, are supposed to be the same with those of the herring. The approach of the pilchard is known by much the same signs as those that indicate the arrival of that fish.

But a small part of the pilchards taken here, are consumed in the country, notwithstanding they are very delicious eating. The greater part are salted, and placed together in large heaps, where they lie for several days under a pressure of large stone weights, by which means the fat and oil are drained from them in large quantities, into proper vessels. They then pack them tight in hogsheads for exportation to Italy, Spain, and France. A considerable quantity of these fish is also used for making pilchard-oil. See further FISHERY, article *Pilchard*.

PILE, in coinage, a kind of puncheon, which, in the old way of coining with the hammer, contained the arms, cross, or legend to be struck for the reverse of the piece. Accordingly, we still call the armside of a piece of money the *pile*, and the head the *cross*; because in ancient monies a cross usually occupied the place of the head in ours.

PILE, in building, is used for a large stake rammed into the ground in the bottom of rivers, or in marshy land, for a foundation to build upon.

PILE-ENGINE. See **ENGINE**.

PILE, among mercers, is used to signify the nap or surface of velvet; and when this, by accident or otherwise, is removed or shorn off, the velvet is said to be *piled*.

PILOT, a person employed to conduct ships over bars and sands, or through intricate channels, into a road or harbour. Pilots are not constant or standing officers aboard our vessels, but are called in occasionally, on coasts or shores unknown to the master; and having piloted the vessel, they return to the shore where they reside.

In many parts, where the approach or entrance to harbours, &c. is hazardous and difficult, the taking a pilot is not a voluntary act, but obligatory on the master; otherwise, in case of a loss, he must make it good; and the following laws are now in force concerning them in England. After a pilot is taken on board, the master has no longer any command of the ship till she

is safe in harbour; but then the master resumes the government of the same, and is to see her bed and lying; the pilot being no longer liable, though for his own convenience he may still be on board. The same rule holds good, if a pilot goes on board only to conduct a ship through some dangerous place, as for instance, Yarmouth roads: after passing them, the master must resume the command, and the pilot is no longer responsible. Yet it may happen that the pilot shall continue on board for the remainder of the voyage: for example, he may want to go to Newcastle; but he is only to be considered as a common passenger, after he has conducted the ship through the hazardous passage, for which purpose he came on board; neither can he charge any wages, salary, or fee, though he should keep the helm during the whole voyage, except for the duty done in passing the roads.

Masters must take pilots when in danger. — If a master of a ship finds himself in tempestuous weather, in any reputed dangerous place, usually denominated *pilot's water*, and a pilot offers to come on board, which offer he refuses to accept, the master in such cases is liable to his owners, freighters, or insurers, for the damage or loss of ship and cargo, if either happen in his attempting a passage without a pilot.

Masters of colliers. — The master of an English collier is held by the Flemings and the Dutch to be a pilot sufficient to conduct his ship from Newcastle to their ports; accordingly, in the case of a ship freighted at Shields by a Flemish merchant at Ostend with coals for that port, he refused to allow the charge of a pilot; the affair was referred to arbitration; when it appeared that the ship was driven by stress of weather into Yarmouth-roads, which are *pilot's water*; and, a pilot offering his service, he accepted him. Had he done otherwise, he would have been answerable to the owners for the ship if it had been lost, and to the freighter for his coals; it was therefore decided that the freighter was bound to allow the pilotage. Pilotage is allowed in most charter-parties, but not for those made for colliers in England.

A great number of statutes have been passed, at different periods, for the regulation of pilotage and pilots; some general, and some local. To rescue the subject from the conflicting provisions of some of these, and for other purposes recited in the preamble, the 48 Geo. 3. c. 104. was enacted, which begins by repealing all former "*clauses, provisions, powers, penalties, forfeitures, matters, and things, relating to pilots appointed by the corporation of the Trinity House, and within the said jurisdiction of the Trinity House, and the liberty of the Cinque Ports.*" It proceeds to enact that thenceforward the corporation of the Trinity House shall alone license, under their seal,

fit and proper persons to conduct *all* vessels navigating and passing up and down the rivers Thames and Medway, and the several channels leading thereto, *between Orfordness and London Bridge*; as, *from London Bridge to the Downs, and from the Downs westward to the Isle of Wight, and in the English Channel from the Isle of Wight up to London Bridge*; and no other persons shall pilot vessels within the limits prescribed by this license, or beyond the extent of this qualification, under a penalty not exceeding 30*l.* nor less 10*l.* for a first offence, and for a subsequent offence, not more than 50*l.*, nor less than 30*l.* s. 42.

Except certain pilots appointed by proper authorities in the Cinque Ports (regulated by two subsequent local statutes, 52 Geo. 3. c. 39., and 53 Geo. 3. c. 140.), so far as such (Cinque Port) pilots are hereby authorised to pilot vessels between the Isle of Wight and London Bridge; and also *except* colliers and other vessels trading to Norway, the Cattegat, and Baltic, and likewise round the North Cape into the White Sea; and *except* all constant traders inwards from the ports between Boulogne inclusive and the Baltic, such vessels having British registers, and passing through the North Channel by Orfordness; and likewise *except* all coasting vessels, and Irish traders using the navigation of the Thames as coasters. s. 2.

The statute proceeds to specify the number and qualification for pilots, and the rates of pilotage, to be hung up at the respective custom-houses.

No owner nor master of a vessel shall be answerable for any loss; nor owners of vessels, or consignee of goods, be prevented from recovering insurance, by reason of no pilot being on board, unless it shall be proved that the want of a pilot shall have arisen from the negligence or obstinacy of the master, a pilot having been ready, and offering to take charge of such vessel. s. 25.

The act not to extend to ships belonging to his majesty; nor to vessels not exceeding 60 tons; nor shall it deprive persons of any remedy by civil action against *pilots or other persons*. s. 26, 27, 28.

The corporation of the Trinity House may make bye-laws for the government of the pilots; and for *the general purposes of the statute*, and annex penalties to the breach of them; but such bye-laws must have the sanction of the chief justice of the court of king's bench, or common pleas, verified under hand and seal; copies of which bye-laws shall be previously transmitted to the privy council, and others immediately hung up in the several custom-houses of the principal ports in Great Britain. s. 34, 35, 36.

The pilotage of ships *not foreign* may be recovered from the owners, master, or consignees, or agents, who may have made themselves liable, as other penalties, accord-

ing to the respective amounts, are recoverable under the act. s. 53.

And pilotage of *foreign* ships may be recovered before a justice of the peace, on the oath of the pilot, in like manner as any penalty under 10*l.* may be recovered by virtue of this act; and consignees of foreign ships may retain in their hands, out of monies received, sufficient to pay pilotage. s. 54.

Reporting a false account of the draught of water of any vessel to the pilot, and altering any marks on vessels to denote such draught, are subjected to penalties by s. 56.; and directions are given by s. 57. how controversies respecting the actual draught of water are to be settled.

It is declared that nothing in this act shall give authority to the corporation of the Trinity House, within any ports or districts having separate jurisdictions in matters of pilotage, by statute or charter, by s. 29.

There are many minute regulations respecting the offences of pilots and others, the modes and forms of conviction, punishment, &c. the rates of pilotage, and other matters of individual interest, or local nature, in the statute, which it has not been thought necessary to insert; and there are ample schedules also annexed to it, which are precluded insertion by their magnitude.

On the construction of a clause in a former statute, and which clause has been copied into this, inflicting a penalty on pilots taking charge of vessels down the river Thames, it was decided that they only extend to vessels sailing on foreign voyages, and not to those which having performed their voyages, are merely steered from one wharf to another on the river, for the purpose of unloading. *R. v. Lambe*, 5 T. R. 76.

Short Abstract of an Act for the better Regulation and Encouragement of Pilots for the conducting of Ships and Vessels into or out of the Port of Liverpool. 37 Geo. 3. c. 78.

The nine first sections of this act repeal a former act of 6 Geo. 3., and constitute a new corporation for the regulation and licensing of pilots in the port of Liverpool.

Committee to license pilots.—The committee appointed in pursuance of this act, or any five or more of them, are to examine any person who shall offer himself to be admitted as a pilot, &c.; and if such person shall be deemed duly qualified, he is to exercise the occupation of pilot within the port of Liverpool, for one year from the date thereof.

But persons acting without a license forfeit 20*l.* for every offence. s. 10, 11, 12.

In case any such licensed pilot shall misbehave, or shall in any wise offend against this act, then such committee are to recall the license granted to such pilot, and to declare the same to be thenceforth utterly void. s. 13. And be fined 10*l.* by s. 27.

The rates of pilotage are generally specified by s. 14 and 15.; but every master or commander of any ship or vessel in the *coasting trade*, including such as trade to or from Ireland, the islands or Faro or Fero, Guernsey, Jersey, Alderney, Sark, or Man, which shall be piloted into or out of the said port, shall pay one-half only of the rates or prices for pilotage; and no ship or vessel whatsoever shall be deemed to be a coasting-vessel, for the purposes of this act, which shall not sail from Liverpool on a coasting-voyage, or which shall not have been really *bonâ fide* employed in the coasting-trade for six months, previous to the time of claiming exemption from the higher rates. s. 16, 17.

But no master or commander of any ship or vessel whatsoever, including such as trade to or from Ireland, the islands of Faro or Fero, Guernsey, Jersey, Alderney, Sark, and Man, whether coastwise or otherwise, piloted into or out of Liverpool by any of the pilots aforesaid, shall pay less than for eight feet draught of water; but, if they shall draw more than eight feet draught of water, the overplus shall be paid for according to the rates specified. s. 18.

By the four succeeding sections a different rate of pilotage for alien vessels, and for vessels under particular circumstances, is provided.

Masters of vessels refusing to take pilots. — In case any master or commander of any ship or vessel inward-bound shall refuse to take on board a licensed pilot who shall offer his service, (except such as shall be in ballast in the coasting-trade, or be under the burthen of one hundred tons), such master or commander shall pay to the pilot who first or who shall only offer his service as aforesaid, the full pilotage according to the different rates and prices before directed, as if the said pilot had piloted such ship or vessel into Liverpool. s. 24.

Pilots leading the way in any vessel. — In case any vessel shall be in want of a pilot, and none can be procured, and there shall be any pilot on board any other vessel going into or coming out of the port of Liverpool, such pilot may lead the way for and conduct the ship or vessel so in want of a pilot; and the master or commander of every such vessel so piloted by leading the way, &c. shall be subject to the same rates of pilotage as if the pilot had actually been on board of such ship or vessel. s. 25.

Assisting distressed ships. — In case any ship or vessel shall be met in distress by any licensed pilot, and shall stand in need of any extraordinary assistance of the crew or boat, then the compensation to be made shall be settled, according to the circumstance of the case, by the committee at their next meeting.

When masters may pilot their own vessels. — The master or commander of any ship or

vessel in ballast, in the coasting-trade, or any ship or vessel being under the burthen of one hundred tons, by the certificate of registry in the coasting-trade, may pilot his said ship or vessel into or out of Liverpool, and any person or persons may assist ships in distress. s. 32.

Masters giving false accounts of draught. — The master or commander of every ship or vessel, to be piloted into or out of Liverpool, shall give a true account, to the pilot employed, of her draught of water; and, in case the pilot shall suspect the truth of such declaration, he is authorised to admeasure her; and if, on such admeasurement, it shall appear that such master or commander gave a false account, wilfully and fraudulently, he shall not only forfeit a sum equal to double the amount of pilotage, but also all the expenses of the admeasurement, and be subject to a fine at the discretion of the committee, not exceeding ten pounds nor less than two pounds, together with all expenses. s. 33.

Masters outward-bound refusing to take pilots. — In case the master or commander of any ship or vessel outward-bound, (except in ballast in the coasting-trade, or under the burthen of one hundred tons,) who shall proceed to sea, and refuse to employ a licensed pilot, such master or commander, agent or consignee, of such ship or vessel, shall pay to the pilot, who first or who only shall offer his services as aforesaid, and be so refused, the full pilotage. And every person taking, or appearing to take upon himself the charge, agency, or consignment of any ship or ships, vessel or vessels, so charged or chargeable with the said respective rates for pilotage and extra-attendances outward-bound, shall be accountable for such rates of pilotage, as shall be so due for such pilotage outward, according to the rates or prices aforesaid; and the same shall and may be levied by distress and sale, after the expiration of three days from the day on which such pilotage shall have been demanded. s. 37, 38, 39.

Penalty on masters forcibly taking away pilots. — As it has sometimes happened that pilots have been forcibly carried to sea beyond the limits for pilotage herein prescribed, if any master of a ship or vessel forcibly carry away any such pilot, he shall forfeit and pay a sum not exceeding 20*l.* nor less than 5*l.*, at the discretion of the committee; and the owner, agent, or consignee, as aforesaid, shall be liable to make reasonable compensation to such pilot or pilots, according to the discretion of the committee. s. 40.

The subsequent sections of this act relate to the accounts of the corporation, their power to make bye-laws, &c. and not to the general interests of the ship-owners and masters.

The last statutes for the regulation of pi-

lotage were 52 Geo. 3. c. 39., and 53 Geo. 3. c. 140., which, though of great importance to the kingdom, as comprehending the access to the port of the metropolis, yet as being entirely local in their provisions, so far as the clauses are not a mere transcript of the 48th Geo. 3. before abstracted, it has not been found convenient to insert them.

PIMENTO, ALLSPICE, or JAMAICA PEPPER, the fruit of the *myrtus pimenta*, L.; the *amomum verum* of some. The pimento trees grow spontaneously, and in great abundance, in many parts of Jamaica, but more particularly on hilly situations near the sea, on the northern side of that island.

This tree is so entirely the child of nature, that not one attempt in fifty to propagate the young plants, or to raise them from the seeds, in parts of the country where it is not found growing spontaneously, has succeeded. The usual method of forming a new pimento plantation, which in Jamaica is called a walk, consists in appropriating a piece of wood land, in the neighbourhood of a plantation already existing, or in a country where the scattered trees are found in a native state, the woods of which being fallen, the trees are suffered to remain on the ground till they become rotten, and perish. In about a year after the first season, abundance of young pimento plants will be found growing vigorously in all parts of the land, which are doubtless produced from ripe berries scattered there by the birds. At the end of two years it will be proper to cleanse the land thoroughly, leaving such only of the pimento-trees as have a good appearance. These will then soon form groves, which perhaps do not require much attention after the first four, or five, years.

It does not appear, that in all the vegetable creation there is a tree of greater beauty than a young pimento. The trunk, which is of a grey colour, smooth, and shining, and entirely free from bark, rises to the height of fifteen, or twenty, feet. It then branches out on all sides, richly clothed with leaves of a deep green, which, in the months of July, and August, are beautifully relieved by an exuberance of white flowers. These leaves are equally fragrant with the fruit; and, in distillation, yield an odoriferous oil, which Edwards informs us, is very commonly used in the medicinal dispensaries in Europe for oil of cloves.

The berries become fit for gathering soon after the trees are in blossom; for the fruit is not suffered to ripen on the tree, because the pulp in that state is difficult to cure. It is, however, impossible to prevent some of the ripe berries from mixing with the rest; but if the proportion of them be great, the price of the commodity is considerably injured.

It is gathered by the hand; and one labourer, on the tree, employed in gathering the small branches, will give employment to

three below (who are generally women and children) in picking the berries. An industrious picker likewise will fill a bag of 70 lbs. in the day. It is then spread on a terrace, and exposed to the sun for about seven days; in the course of which it loses its green colour, and becomes of a reddish brown, and, when perfectly dry, is fit for market.

In a favourable season, a single pimento tree has been known to yield 150 lbs. of the raw fruit, or one cwt. of the dried spice; for there is generally a loss of one third in curing. A plenteous crop, however, occurs, perhaps, but once in five years; and the price in the British market fluctuates accordingly.

Some planters kiln-dry the pimento berries with great success, and it seems indeed a most eligible method, where, from abundance of the crop, dispatch and security against rain are very essential. Pimento is usually imported in bags and casks. — As there is so great an affinity between this spice, and the true clove, it has been proposed, as worthy of trial, if the fruit, when first formed, or the flowers picked off the tree and dried, might not answer the same purpose as the Asiatic clove; The more odoriferous, and small, the berries are, the better they are reckoned: The leaves, and bark, of the pimento-tree are full of aromatic, inflammable particles, for which reason, the growers are extremely cautious not to suffer any fire to be made near the walks, for if once it should catch the trees, they would burn with great fury. The berries have a similarity in smell, and taste, to cloves, juniper-berries, cinnamon, and pepper, or rather a peculiar mixture somewhat akin to all of them; whence their name of allspice. There is a species of pimento growing in Spanish America, whose berry is larger, weaker in its aroma, and consequently inferior in its quality, to the West Indian.

This article we import almost exclusively from Jamaica, whence we procure about two millions of pounds annually. Of this quantity, no inconsiderable part is sold to the Dutch, who, we are told, impose not only upon us but upon the rest of Europe, by reducing the pimento to powder and selling it as pulverised cloves; it is said that they likewise dispose of large quantities of pimento oil under the name of clove-oil.

The Americans mix pimento with their chocolate, and denominate the mixture *malagueta*, or *manigueta*; it is reported to be extremely palatable. If pimento be left, for some time, to soak in good brandy, it will yield by distillation, an odoriferous spirit, which, by the addition of a proportionate quantity of sugar, may be converted into a most agreeable and highly stomachic cordial.

For the foreign denominations of **PIMENTO**, see **JAMAICA-PEPPER**.

PIN, (GER. *Stecknadeln*, *Knüpfnadeln*. DU. *Spelden*. DA. *Knappenaale*. SW. *Knappnalar*. FR. *Epingles*. IT. *Spilli*, *Spilletti*. SP. *Alfileres*. PORT. *Alfinetes*. RUS. *Bulawki*. POL. *Szpilki*.) a small instrument of wire, principally used by females in adjusting their dress. They are mentioned in a statute of Rich. 3. prohibiting their importation, 1485. — Next, in the year 1543, by statute 34 & 35 Hen. 8. cap. 6, it was enacted, "that no person shall put to sale any pinnes but only such as shall be double-headed, and have the heads soldered fast to the shank of the pins, well smoothed, the shank well shapen, the points well and round filed, cauted, and sharpened."

Though pins are apparently simple, their manufacture is, however, not a little complex. When the wire, (generally brass,) of which the pins are formed, is first received at the manufactory, it is generally too thick and too soft for the purpose of being cut into pins. The first operation, therefore, is that of winding it off from one wheel to another with great velocity, and causing it to pass between the two, through a circle in a piece of iron of smaller diameter: the wire being thus reduced to its proper dimensions, and also hardened by this process, is straightened by drawing it between iron pins, fixed in a board in a zigzag manner, but so as to leave a straight line between them: afterwards it is cut into lengths of three or four yards, and then into smaller ones, every length being sufficient to make six pins; each end of these is ground to a point, which is commonly performed by boys, who sit each with two small grinding-mills before him, turned by a wheel. Taking up a handful, he applies the ends to the coarsest of the two mills, being careful at the same time to keep each piece moving round between his fingers, so that the points may not become flat: he then gives them a smoother, and sharper, point, by applying them to the other mill, and by that means a lad of twelve, or fourteen, years of age is enabled to point about 16,000 pins in an hour. When the wire is thus pointed, the length of a pin is taken off from each end, and this is repeated till it is cut into six pieces. The next operation is that of forming the heads, or, as they term it, head-spinning; which is done by means of a spinning-wheel, one piece of wire being thus with astonishing rapidity wound round another, and the interior one, being drawn out, leaves a hollow tube between the circumvolutions: it is then cut with shears, every two circumvolutions or turns of the wire forming one head: these are softened by throwing them into iron pans, and placing them in a furnace till they are red-hot. As soon as they are cold, they are distributed to children, who sit with anvils and hammers before them, which they work

with their feet, by means of a lathe; and taking up one of the lengths, they thrust the blunt end into a quantity of the beads which lie before them; and catching one at the extremity, they apply them immediately to the anvil and hammer; and by a motion or two of the foot, the point and the head are fixed together in much less time than it can be described, and with a dexterity only to be acquired by practice; the spectator being in continual apprehension for the safety of their fingers' ends. The pin is now finished as to its form, but still it is merely brass; it is therefore boiled in a copper, containing a solution of tin, with water, and the leys of wine. Here it remains for some time; and when taken out assumes a white, though dull appearance: in order therefore to give a polish, it is put into a tub containing a quantity of hot bran, which is set in motion by turning a shaft that runs through its centre; and thus by means of friction it becomes perfectly bright. The pin being complete, nothing remains but to separate it from the bran; which is performed by a mode exactly similar to the winnowing of corn, the bran flying off, and leaving the pin behind, fit for immediate sale.

The pins most esteemed in commerce are those of England; those of Bourdeaux are next; and then those made in some other parts of France. The London pointing and whitening are in the highest repute, because our pin-makers in pointing use two steel-mills, the first of which forms the point, and the latter takes off all irregularities, and renders it smooth, and, as it were, polished; and in whitening they use block-tin finely granulated, whereas in other places they mix their tin with lead and quicksilver, which not only whitens worse than the former, but is a dangerous implement, since the least puncture made with it is not so readily cured, and if not attended to may prove injurious. Pins are distinguished by numbers; the smaller are called from No. 3, 4, 5, to 14, whence they go by *two's*, viz. No. 16, 18, 20, which latter is the largest size. — Besides the white pins, there are black ones, prepared with a sort of Japan varnish, for the use of mourning; their numbers run from 4 to 10. Pin is also an instrument recognized in the sciences of artillery, clock-making, ship-building, &c.

PINCERS, an instrument by which nails are drawn, or any thing is gripped, which requires to be held hard. They are of various forms, according to the uses for which they are intended, and are chiefly employed by blacksmiths and carpenters.

PINCHBECK, (GER. *Tombak*. DU. *Tombak*. DA. *Tambak*, *Tombak*. SW. *Tomback*. FR. *Tambac*, *Similor*. IT. *Tombacco*. SP. *Tambac*, *Tumbaga*. PORT. *Tombaque*.) a name given to one, of the

many imitations of gold. By melting yellow copper in various proportions with red copper, some ductile alloys result, the colours of which approach more, or less, to that of gold.

This composition is frequently employed as a substitute for gold in the formation of watch-cases, and various other articles of a like description. Pinchbeck is sometimes called *Tombac*, and sometimes *Similor*, and *Petit-or*.

PINE-TREE. (GER. *Föhre*, *Kiefer*. DU. *Pynboom*. DA. *Fyr*, *Fyrretræ*, *Furr*. SW. *Furu*, *Tall*. FR. *Pin*. IT. and SR. *Pino*. PORT. *Pinheiro*, *Pinho*. RUS. and POL. *Sosna*. LAT. *Pinus*.) The *Pinæa Pineaster*, or wild pine, grows naturally on the mountains of Italy and the south of France. It grows to the size of a large tree; the branches extend to a considerable distance; and while the trees are young, they are full of leaves; but as they advance to age the branches become naked. The *Pinus pinæa*, or stone-pine, is a tall evergreen tree, a native of Italy and Spain. It delights in sandy loam, though, like most others, it will grow well in almost any land. It is planted merely for ornament in this country, its timbers being brittle, and of no value. — The *Strobus*, or Weymouth, or North American white pine, grows sometimes to the height of 100 feet, and upwards, and is highly valued on account of its beauty. The wood of this sort is esteemed for making masts for ships. In Queen Anne's time, there was a law made for the preservation of this species of tree in America. Within the last 50 years it has been propagated in Britain in considerable plenty. The *pinus tedæ*, or swamp-pine, is a tall evergreen tree, a native of the swamps of Virginia and Canada. From the *pinus sylvestris* comes the common turpentine. From the *pinus abies* the Burgundy pitch.

The **FIR-TREE** is a species of pine, but we refrain from noticing it any further under the present article, having already treated of it at large under other heads.

The **CEDAR** and the **LARCH-TREE** are likewise of the genus of pine, and are to be found under their proper heads.

PINE-APPLE. There are nine species of the plant which produces this fruit, but it is beside our purpose to enumerate them.

The pine-apple is propagated by planting the crowns, which grow on the fruit, or the suckers, which are produced either from the sides of the plants, or under the fruit. The suckers, or crowns, must be laid to dry in a warm place for four or five days, or more; for if they are immediately planted, they will rot. The certain rule of judging when they are fit to plant, is to observe if the bottom is healed over and become hard. In summer they must be frequently watered, but not with large quantities at a time; and the moisture

should not be detained in the pots by the holes being stopped, for that will soon destroy the plants. If the season is warm, they should be watered twice a week. Plants beginning to show the fruit should never be shifted; for if they are removed after the fruit appears, it stops the growth, and thereby causes the fruit to be smaller, and retards its ripening, so that it will be October or November before the fruit is ripe; therefore the plants should be kept in a vigorous growing state, from the first appearance of the fruit, as upon this depend the goodness, and size, of it. After cutting off the fruit from the plant intended to be propagated, the leaves should be trimmed, and the pots plunged again into a moderate hot-bed, observing to refresh them frequently with water, which will make them put out suckers in plenty. By these means the pine-apple plant may be brought to great perfection in this country. It grows spontaneously in South America, Africa, and the East, and West, Indies, whence the fruit is brought to us preserved entire in rich syrup. There is a wine made from the pine-apple, which is esteemed almost equal to malmsey. This fruit also supplies the physicians with some remedies. This excellent fruit makes part of the refreshment wherewith the Indians and Africans, near the line, entertain European mariners, and barter it for toys, and other baubles, of which they are extremely fond. The pine-apple is much esteemed as an ornament for the table, when it is preserved perfectly green; abundance of the fruit is sent home in this state, packed up in jars, to Europe from the West India islands. The crown is usually preserved with the apple, as its removal would diminish the elegant appearance of the fruit.

PINE-KERNELS. (GER. *Pinien*. DU. *Pinzellen*. DA. and SW. *Pinoler*. FR. *Pignons doux*. IT. *Pinocchi*, *Pignoli*. SP. *Pinones*. PORT. *Pinhões*. POL. *Pinelle*, *Pinole*. LAT. *Pinoli*.) the kernels of the species of pine called the *pinus pinæa*, which see under the article **PINE-TREE**.

PINK, among painters, a sort of yellowish or pale red colour. See **DYEING** and **PAINTING**.

PINK, a vessel used at sea, masted and rigged like other ships, only that this is built with a round stern; the bends and ribs compassing so as that her sides bulge out very much. This disposition renders the pinks difficult to be boarded, and also enables them to carry greater burdens than other vessels: whence they are often used for hospital, and store, ships in the fleet.

PINK-ROOT, or **INDIAN PINK-ROOT**, is the produce of the *spigelia marilandica*, or perennial worm-grass, and is used as a medicine for renitting low worm-fevers.

PINNACE, a small vessel used at sea, with a square stern, having sails and oars, and carrying masts, chiefly used as a scout

for intelligence, and for landing of men, &c. One of the boats belonging to a man of war, serving to carry the officers to and from the shore, is also called the pinnace.

PINT, a measure used chiefly for estimating liquids, and some dry things. The word is high Dutch, and signifies a little measure of wine. The English pint is of two sorts; the one for wine-measure, the other for beer and ale measure: the wine pint contains a full pound avoirdupois of common running water; two pints make a quart; two quarts a pottle; two pottles a gallon, &c. The pint, liquid measure, contains 35.25 cubic inches. A pint, corn-measure, is nearly 33.6 inches in content.

The Paris pint is one-sixth of the ancient *congius*, and contains two pounds of common water; it is divided into chopines or septiers; the septiers into demi-septiers; the demi-septiers into two boissens, each of which contains six cubic inches. The pint of St. Denis is almost double that of Paris.

PIPE, a wine-measure, usually containing from 110 to 140 gallons. Two pipes, or 252 gallons, make a tun. The pipe of Port contains 138 gallons, of Sherry 130, of Lishon and Bucellas 140, of Madeira 110, and of Vidonia 120.—The pipe of Port, it is to be observed, is seldom accurately 138 gallons, and it is not unusual to charge what the vessel actually contains.

PIPE, in building, &c. a canal, or conduit, for the conveyance of water, and other fluids. Pipes for water, water-engines, &c. are usually of lead, iron, earth, or wood: the latter are commonly made of oak or elm. Those of iron are cast in forges; several of these are commonly fastened together by means of four screws at each end, with leather, or old hat, between them, to stop the water. Those of earth are made by the potters; these are fitted into one another, one end being always made wider than the other. To join them the closer, and prevent their breaking, they are covered with tow and pitch: the wooden pipes are trees bored with large iron augers, of different sizes, beginning with a less, and then proceeding with a larger successively; the first being pointed, the rest formed like spoons, increasing in diameter, from one, to six inches, or more: they are fitted into the extremities of each other, and are sold by the foot.

A patent was obtained in 1806, for making wooden pipes upon a new construction, by one Eckhardt, but it has not been attended with much effect. Cast-iron pipes appear now to be most in request for great concerns, such as for the communication of water, and gas, through the streets of London. Both stone, and lead pipes, have indeed been the subjects of several patents, within the last ten years, but the iron pipes appear to have completely superseded them, except for small water-pipes

to buildings; and for such, Bramah's invention (patent of 1796) appears to be the best and cheapest construction.

Pottery pipes are chiefly used for draining land, and are made at most of the manufactories for coarse pottery. They cannot be too highly recommended even on their simplest construction.

In 1808, a Mr. Bell took out a patent for these earthen pipes, upon a more complicated construction, adapting them for the use of the largest aqueducts.

PIPE-CLAY. (GER. *Pfeifenthon*. Du. *Pypklaar*. DA. *Piisjord*. Sw. *Piptera*. FR. *Terre à pipes*. It. *Terra da pippe*. Sp. *Tierra de pipa*. PORT. *Terra de cachimbos*.) The difference between the porcelain clay, and those of more moderate purity, called pipe-clays, of which we have plenty in Devonshire, is commonly, that the former remains white when burned in an open fire; but the latter, containing a portion of mineral oil, becomes of a blueish-grey in a moderate heat, by the coal produced by this combustion. A stronger heat, however, will perfectly consume this coal, and restore the whiteness. On the whole, however, it appears rather as if this distinction between the clays used in pottery were grounded on the nature of the product they afford, than on any very evident property ascertainable before they are wrought and baked. Besides its use in the manufacture of tobacco-pipes, pipe-clay is employed as a detergent, by scowerers of cloth, &c.

Pipe-clay is allowed to be exported to all his majesty's plantations in vessels that may lawfully trade thither, by 47 Geo. 5. c. 49.; but the 57 Geo. 5. c. 88. prohibited it from being carried coastways, except under the regulations imposed by 52 Geo. 5. c. 50.

PIPES, or TOBACCO-PIPES, (GER. *Pfeifen*, *Tabacks Pfeifen*. Du. *Pypen*, *Tabackspypen*. DA. *Tobackspiber*. Sw. *Tobackspipor*. FR. *Pipes à tabac*. It. *Pippe*. Sp. *Pipas*. PORT. *Cachimbos*. Rus. *Trubki tabatschuwa*. Por. *Zulki*.) well-known machines used in smoking tobacco; they consist of a long slender tube or shank, which is hollowed, being made of pipe-clay baked; at one end is the bowl or furnace for the tobacco, the fumes whereof are drawn out by the mouth at the other end, and so discharged.—Pipes are made long, short, plain, worked, varnished, unvarnished, of various colours, &c. The Turks use pipes, three or four feet long, made of rushes, or bored wood, at the end of which is a nut of baked earth for taking off, or putting on. Tobacco-pipes made from clay, are formed in moulds, the hollow in the tube being made by running up a wire; the pipes are then dried and baked in a furnace moderately heated.

PIPE STAVES, (GER. *Pipenstabe*. Du. *Pypduigen*. DA. *Pibestaver*. Sw. *Pipkinmar*, *Pipstafvar*. FR. *Deuves à pipes*. It. *Doghe di botti*. Sp. *Duelas para pipas*. PORT. *Aduelas*

para pipas. Rus. *Pipowija doschtscherzki*.) the staves, or long narrow pieces of timber, of which wine barrels, hogsheads, casks, &c. are formed. Pipe staves are made from various kinds of wood, more especially fir, and oak. They are imported in abundance from Dantzic, Hamburgh, Memel, Stettin, and other parts of the North of Europe, and from Quebec, and some other places in North America.

PIRATE, a sea-robber, who enriches himself by marine robberies, committed either by force, fraud, or surprise, on merchants or other traders at sea. Those who rob in rivers, and who are, perhaps, not less numerous, though not so open in their depredations, as the sea-pirates, are usually distinguished from the latter by the designation of river-pirates.

By stat. 28 H. 8. c. 15. all treasons, felonies, robberies, murders, and confederacies, committed upon the sea, or in any haven, creek, or place where the admiral has jurisdiction, shall be tried in such shires, or places, as the king shall appoint by his commission, in like forms, as if such offence had been committed upon land, and according to the course of the common law, and the offenders shall suffer death without benefit of clergy. And by stat. 6 Geo. 1. made perpetual, it is enacted, that if any of his majesty's natural-born subjects, or denizens of this kingdom, shall commit any piracy or robbery, or any act of hostility, against other his majesty's subjects, upon the sea, under colour of any commission from any prince or state, or pretence of authority from any person whatsoever, such offender shall be deemed to be a pirate, felon, and robber; and being duly convicted thereof according to this act, or the aforesaid act of 23 H. 8., shall have and suffer such pains of death, loss of lands, goods, and chattels, as pirates, felons, and robbers upon the seas, ought to have and suffer. By 18 Geo. 2. c. 30. persons committing hostilities, or aiding enemies at sea, may be tried as pirates.

The 59 Geo. 3. c. 37., enacts that all offences whatever, committed on the high seas, shall be liable to the same punishment, as if committed on shore; and persons tried for murder, or manslaughter, and found guilty of the latter only, shall have the benefit of clergy.

An Englishman, committing piracy on the subjects of any prince or state in amity with the crown of England, is within the statute of 28 Hen. 8.

The same observation applies to the subjects of any other nation or kingdom, being in amity with England, who shall commit piracy on the ships of the latter. *Rot. Adm.* 28 *Eliz. m.* 24.

If a merchant lose his goods by piracy, and they are afterwards recovered, he has a right to reclaim them. And if a pirate sells the goods he steals, the right owner's

property therein is not thereby changed. 3 *Bul.* 28. 29. *March*, 110. *Godb.* 193. *Barber's Case*.

But if a pirate, having taken goods from the subjects of a prince, (even though in league with us,) bring the goods, and sell them in open market, the same shall bind, and the owners are for ever excluded. *Bingley's Case.* 1 *Rolls Abridg.* 530. *Lit. c.* 4. *Grot. l.* 3. c. 9. s. 16.

PISSELEUM, oil of pitch, the watery part which swims on pitch, and is separated therefrom while the pitch is boiling, by spreading over it clean wool, which, as soon as it is thoroughly moistened with the ascending vapour, is wrung into a vessel, and this is repeated as long as the pitch continues to boil. It is effectual for the same purposes as tar.

PISSELEUM-INDICUM, commonly called Barbadoes tar, is a mineral fluid of the nature of the thickest or more tenacious bitumens. It is a dusky-coloured matter, less viscid than asphaltum, and about the consistence of treacle. It is of a nauseously bitterish taste, and very disagreeable smell. It is soluble in oil, and is very frequent in America, where it is found trickling down the sides of mountains in large quantities, and sometimes floating on the surface of the waters; but it seems to be almost lost at this time in the country (India) whence it was originally named. It is not unknown in some of the northern counties of England, where it goes by the name of rock-oil, and is used in farriery externally for bruises and sprains. It has been greatly recommended internally in coughs and other disorders of the breast. For the foreign names of this article, see **BARBADOES TAR**.

PISTACHIA, **PISTACIA**, or **PISTACHIO NUTS**, (GER. *Pistaschen.* DU. *Pistasjes.* DA. *Pistacier, Pistaser.* SW. *Pistacier.* FR. *Pistaches.* IT. *Pistacchi, Fastucchi.* SR. *Alfocigos.* PORT. *Pistacias, Fisticos.* POL. *Pistacye.* LAT. *Pistacia*.) are the fruit of the *pistachia terebinthus*, a kind of turpentine tree. It grows naturally in Arabia, Persia, and Syria; also in Sicily, whence the nuts are annually brought to us. There are likewise some species of this tree cultivated in the East Indies, and in several parts of Portugal, Spain, Italy, and France. The fruit loses much of its beauty by drying, but improves perhaps in flavour. The tree, when laden with clusters of the ripe, smooth nuts, of a beautiful pale bluish colour, makes a fine appearance. It seldom exceeds thirty feet in height, and is often not more than twenty; the trunk, which is proportionally short, is about three, or three feet and a half, in circumference. Some of these trees have male, and others female flowers, and some both male and female on the same tree. The female flowers come out in clusters on the sides of the branches: they have no petals, but a large oval germen, supproting

three reflexed styles, and are succeeded by oval nuts. These nuts are moderately large, containing a kernel of a pale greenish colour, covered with an outer husk of different hues, from almost white to red. They have a pleasant, sweet, and unctuous taste, resembling that of almonds, and abound with a sweet, well-tasted oil, which they yield in great abundance, on being pressed after bruising them. They are wholesome and nutritive, and in medicine are classed among the analeptics and restoratives. Pistachia nuts are very proper to be eaten moderately by people emaciated with long illnesses, and are recommended as peculiarly good to prevent obstructions of the liver. They are also found of service in nephritic cases. The Persian pistachias, and those of the eastern countries, are far superior to those of any part of Europe. Vast quantities of pistachia nuts of excellent quality are annually carried to Aleppo, where they are in such demand among the inhabitants of the adjacent country, that seldom more than two hundred quintals are exported to Europe, in the course of a year. The crop of pistachia nuts is, year after year, alternately meagre, and abundant, in the island of Sicily. The quantity exported in a plentiful season is about six hundred and fifty salmes; and at other times, seldom more than one-fourth of that amount. The ordinary price of the Sicilian pistachias is four ounces, fifteen tarins, or nearly 8s. per salme. The greater part of the pistachia nuts, grown in Sicily, are exported to Genoa, Leghorn, Venice, Marseilles, and to the English ports. The shell of the pistachio is sometimes preserved green, and in this state forms an article in confectionary. The kernels are likewise frequently pickled, ere they arrive at maturity, in the same manner as gherkins. There is a sort of spurious pistachia nut, which grows in some of the West India islands, but which is by no means comparable to the true nut, nor indeed can it be used as a substitute for the latter.

PISTAREEN, an old name for a Spanish coin, worth something less than a shilling, still current under that name in the West Indies, but called, in Spain itself, *pecatas*.

PISTOL, a small hand-gun, of a structure too well known to require particular description. Pistols are of various sizes, some being so small that they may be deposited in the waistcoat-pocket; these are called pocket-pistols; others, such as duelling and horse-pistols, are sometimes nearly half as long as a carbine. Pistol barrels are oftentimes rifled, and have frequently the addition of a sight. The best pistols are manufactured at London; those of an inferior kind at Sheffield, and Birmingham. The stocks of the pistols intended for the Turkey trade, are usually inlaid with silver, gold, mother of pearl, &c.; and are on the whole

far more costly than those sent to any other part of the world. Pistols, if well mounted, fetch excellent prices at Constantinople and Smyrna.

PISTOLE, the name of a coin and imaginary money, in use in several parts of Europe, more especially in Spain, Italy, and Switzerland. The pistole of Spain of 1801 is worth about 16s. The Spanish pistole of gold passes in the French and British West Indies at 16s. 9d.

PISTON, a part of the machinery in all pumps, commonly called the sucker. See *tiles* ENGINE, and PUMPS.

PITCH. (GER. *Pech*. DU. *Pek*. DA. *Beg*. SW. *Beek*. FR. *Poir*, *Brai*. IT. *Pece*. SP. *Pez*. PORT. *Brea*. RUS. *Smola gustaja*. POL. *Smola*. LAT. *Pis*.) Tar boiled down to dryness is the common black pitch: this part of the process is commonly performed in a still, in order to save an essential oil, which arises in the boiling, and which is called, from the name of the tree which tar is principally prepared from, *oleum pini*, and *oleum tædæ*. This oil is greatly valued by painters, varnishers, &c., on account of its drying quality: it soon thickens of itself almost to the consistence of a balsam. Along with the oil there comes over a watery liquor, which the workmen injudiciously throw away, though it is a good acid, (now known to be the pyroligneous,) capable of being applied to sundry useful purposes.

Pitch is not a pure and perfect resin; it has not only suffered a notable change from the heat employed in its preparation, but likewise participates of the other principles of the wood of a gummy and saline nature, and of a burnt earth. Hence its disposition to separate and precipitate, when melted with oils, fats, and resins, into plasters and ointments; and hence it is gradually corroded by air and moisture, when employed as a cement or defence for wood or other substances; in ships, carriages, cisterns, casks, shingle coverings for houses, &c. Ship-builders endeavour to improve their tar and pitch, so as to render them more durable, by various additions. See PINE-TREE.

The soot which arises in the burning of pitch is the substance commonly sold under the name of lamp-black: in France the pitch is burnt for this purpose in a kind of furnace made of tiles, so disposed as to prevent the escape of the smoke.

What is called lamp-black (originally the soot collected from lamps) is obtained in different parts of Germany, Sweden, &c., not from pure resin or pitch, but from the dregs and pieces of bark of the tree separated in their preparation. For making common resin, the impure juice collected from incisions in pines and fir-trees is boiled down with a little water, and strained, while hot, through a sack: on cooling, the resin congeals upon the surface of the water, and is then packed up in barrels; it is distinguished,

according to its colour, into white, yellow, and brown. The dross left on straining is burnt for lamp-black, in a low oven, from which the smoke is conveyed by a long passage into a square chamber, having an aperture in the top, upon which a large sack is fastened: the soot concretes partly in the sack, which is occasionally removed, and partly in the chamber and passage, from which it is swept out.

Though abundance of pitch is made in Great Britain, we import vast quantities of the article from Russia, Sweden, and North America.

PITCH, *Burgundy*. See TAR.

PITCH, *Mineral*. See PISSELEUM INDICUM, and BARBADOES TAR.

PITCH, *Jews*. See ASPHALTOS.

PITCH-STONE. See ASPHALTUM.

PITCH-BLENDE is a mineral found in masses, or else stratified with other earths or minerals in the Swedish and Saxon mines.

PIT-COAL. See COAL.

PITI, a copper coin, current in the island of Japan at the value of one-fifth of a penny sterling.

PLAGUE, a pestilential disease, against the introduction of which into this kingdom the laws of quarantine have been enacted. See QUARANTINE.

PLAID, a striped or variegated stuff, sometimes made of silk, sometimes of wool, and sometimes of a mixture of these substances. Plaids are usually divided into broad and narrow striped plaids, and are manufactured principally in Scotland, where they are a very favourite dress, especially among the lower orders of the people.

PLAINTIFF (in law), the complainant, or he who brings an action against another.

PLANES, (GER. *Hobel*. DU. *Schauen*. DA. *Hüvel*. SW. *Höflar*. FR. *Rabots*. IT. *Pialle*. SP. *Cepillos*, *Planas*. PORT. *Cepilhos*, *Plainas*. RUS. *Strug*. POL. *Hebly*.) in joinery, are edged tools, or instruments for paring and shaving wood smooth.

The plane consists of a piece of wood, very smooth at bottom, as a stock or shaft; in the middle of which is an aperture, through which a steel-edge, or chisel, placed obliquely, passes, which being very sharp, takes off the inequalities of the wood it is slid along. Planes have various names, according to their various forms, sizes, and uses; as, 1. The fore-plane, which is a very long one, and is usually that which is first used; the edge of its iron or chisel is not ground straight, but rises with a convex arch in the middle; its use is to take off the greater irregularities of the stuff, and to prepare it for the smoothing-plane. 2. The smoothing-plane is short and small, its chisel being finer; its use is to take off the greater irregularities left by the fore-plane, and to prepare the wood for the jointer. 3. The jointer is the longest of all; its edge is very fine, and does not stand out above a hair's

breadth; it is chiefly used for shooting the edge of a board perfectly straight, for jointing tables, &c. 4. The strike-block, which is like the jointer but shorter; its use is to shoot short joints. 5. The rabbit-plane, which is used in cutting the upper edge of a board, straight or square, down into the stuff, so that the edge of another, cut after the same manner, may join in with it, on the square; it is also used in striking fascias on mouldings; the iron or chisel of this plane is as broad as its stock, that the angle may cut straight, and it delivers its shavings at the sides, and not at the top, like the others. 6. The plough, which is a narrow rabbit-plane, with the addition of two staves, on which are shoulders; its use is to form a narrow square groove on the edge of a board. 7. Moulding-planes, which are of various kinds, accommodated to the various forms and profiles of the moulding; as the round-plane, the hollow-plane, the ogee, the snipe's bill, &c., which are all of several sizes, from half an inch to an inch and a half.

PLANKS, (GER. and DU. *Planken*. DA. *Planker*. SW. *Plankor*. FR. *Planches*. BORDAGES. IT. *Tavole*. SP. *Tablas*. PORT. *Pranchas*, *Taboas*. RUS. *Tolstie olosku*.) thick strong boards, cut from various kinds of wood, especially oak, pine, and fir. Planks are usually of the thickness of, from one inch, to four. They are imported in large quantities from the northern parts of Europe, particularly from the ports of Dantzick, Archangel, Petersburg, Narva, Revel, Riga, and Memel, as well as from several parts of North America. Those of Christiania, in Norway, are the best in the world. See title EUROPE, article NORWAY.

PLANK, thick. (GER. *Bohlen*. DU. *Balkplanken*. DA. *Bohler*. SW. *Bjellplanckor*. FR. *Mudiers*. IT. *Tavolini*, *Tavole grosse*. SP. *Tablones*. PORT. *Pranchões*.) The planks which are used as mediums of communication between vessels and the shore, and for other purposes requiring durability and strength, are thus called.

PLANTATIONS are territories in some foreign part, peopled by, and dependent upon, the mother country; and they are either provincial establishments, whose constitutions depend upon the instructions given by the crown to their governors; proprietary governments, granted by the crown to individuals; or chartered governments, in the nature of civil corporations. For the recent regulations relating to the British Plantations, see NAVIGATION.

In actions of debt, or account, between persons resident in Great Britain, and others in any of the British plantations, the plaintiff, defendant, or any witness, may prove any matter by affidavit, in writing, upon oath before any mayor, or other chief magistrate, near to which such party shall reside, and certified and transmitted under

the common seal of the city, or the seal of the office of such mayor; and every oath so certified and transmitted shall be as good and valid, as if the party had appeared and sworn such affidavit in open court: such affidavit must contain the name, and place of abode, of the party making the same.

Houses, lands, negroes, and all real estates within the plantations, belonging to any persons indebted, shall be liable to satisfy all debts due to his majesty, or any of his subjects, and shall be considered as assets for the satisfaction of the same, in like manner as real estates are by the laws of England, and subject to the same remedies. *See titles SHIPPING, and MAYOR.*

PLANTER, a denomination given to the owner of a plantation; in a commercial sense it is peculiarly applicable to one who cultivates sugar, &c. in the West Indies.

PLAPECK, a silver coin of Germany, worth $2\frac{1}{10}$ d. sterling.

PLAPERCT, a silver coin of Switzerland, worth $1\frac{1}{2}$ d. sterling.

PLASM, a mould or matrix, in which any thing is cast or formed.

PLASTER, or **PLAISTER**, a substance made of water and some absorbent matter, such as chalk, or lime, well pulverised, with which walls are overlaid, or figures cast.

PLASTER OF PARIS. The sulphate of lime, after being calcined, is termed burned gypsum, or plaster of Paris.

The following approved mode of casting plaster of Paris on copper-plates, may very properly be introduced in this place.

First rub the colour, either red, brown, or black, into the graving, and wipe the plate clean; then mix as much plaster as you think you shall have occasion for, with fresh water, to the consistence of a thin paste, and having put a border round the plate, of four pieces of reglet, pour the plaster upon it, and move it so as that it may run even all over the plate: let it stand for an hour, or longer, according to the dimensions of the plate, and when you find it dry, and turned hard, take off the reglets, and then the plaster, and you will have a fine impression of the copper graving: You must observe not to mix more at a time than you have occasion, else it will grow hard before you can use it.

PLASTER, (*GER. Pflaster. DU. Plaaster. DA. and Sw. Plaster. FR. Enplâtre. IT. Impiastro. SP. Enplasto. PORT. Emplastro. PARCHE. RUS. Plustur. POL. Plastr. LAT. Emplastrium.*) in pharmacy, a glutinous or adhesive salve, spread upon leather or cloth, and in that state to be applied as a covering of sores, &c.

PLATA, or **PLATE**, in Spanish commerce, a word denoting silver species, as *vellon* denotes copper species; by these two terms they also distinguish between several of their monies of account.

PLATE, gold or silver wrought into household furniture.

Every dealer in plate is obliged to take out an annual license by the laws of excise, 32 Geo. 2. c. 24. To prevent frauds in the making of plate, by several statutes, assayers are appointed in certain places for the assaying and marking it. The 6 Geo. 1. c. 11. contains the regulations respecting the standard of fineness; and 24 Geo. 3. c. 53. those respecting the mode of proceeding to have it assayed according to such standard. The 44 Geo. 3. c. 98. and 52 Geo. 3. c. 59. allow certain drawbacks on the exportation of manufactured plate, as well for private use, as for merchandise.

PLATINA, the heaviest of all metals, its specific gravity being to that of water, as twenty-three to one; that of gold being only nineteen. Its colour is that of the purest silver. The very small globules of it are extremely malleable; but when many of these are collected together, they can scarcely be so perfectly fixed as to preserve the same degree of malleability. They are not in the least affected by the magnet, nor can they be dissolved in any simple menstruum, excepting dephlogisticated marine acid. Platina, however, as it is commonly met with, is mixed with many foreign substances, as gold, mercury, and blackish, ferruginous, sandy particles. In this state it has the form of small grains, its plates of a bluish-black, whose colour is intermediate betwixt those of silver and iron. The great specific gravity of platina has rendered it a very desirable matter for such as wish to adulterate the precious metals. This, however, can only be done in South America, where platina is met with in plenty. In Europe, its scarcity renders it a more valuable object than gold itself. Fears of this fraud have undoubtedly given occasion to the prohibition of exporting it from America. It is not difficult to discover the adulteration by this metal, through the medium of green vitriol, which throws down the gold, and leaves the platina united with the menstruum: and by various other methods, but chiefly by its specific gravity. Platina has been remarkable, ever since its first discovery, for being the most infusible substance in the world. It has been kept in the most violent heat of a glass furnace, for several days, without undergoing any alteration. This refractory metal was first melted with a large burning mirror. It has since been found not only capable of fusion, but of vitrification, by electricity.

Platina is one of the metals for the discovery of which we are indebted to our contemporaries. Ulloa appears to have first mentioned it in 1735; and our countryman Wood brought a quantity from Jamaica in 1741. It was supposed to be found only in Spanish America, among the gold mines there. However, it has lately been dis-

covered in Spain, in the mines of Guadalcanal, which have been re-opened; and there are said to be two ancient candlesticks in a cathedral in Germany, apparently made of it before America was discovered.

The part of the world where platina is found in the greatest abundance, at the present day, is South America. Santa Fé, near Carthagena, is the only place in South America where it is to be met with, and hence the Spaniards have been in the habit of procuring it since the year 1750, or thereabouts.
